

2.5V SINGLE DATA RATE 1:10 CLOCK BUFFER TERABUFFER™

IDT5T907
NRND

NOT RECOMMENDED FOR NEW DESIGNS

FEATURES:

- Guaranteed Low Skew < 125ps (max)
- Very low duty cycle distortion
- High speed propagation delay < 2.5ns. (max)
- Up to 250MHz operation
- Very low CMOS power levels
- 1.5V V_{DDQ} for HSTL interface
- Hot insertable and over-voltage tolerant inputs
- 3-level inputs for selectable interface
- Selectable HSTL, eHSTL, 1.8V / 2.5V LVTTTL, or LVEPECL input interface
- Selectable differential or single-ended inputs and ten single-ended outputs
- 2.5V V_{DD}
- Available in TSSOP package
- **NOT RECOMMENDED FOR NEW DESIGNS**

APPLICATIONS:

- Clock and signal distribution

DESCRIPTION:

The IDT5T907 2.5V single data rate (SDR) clock buffer is a user-selectable single-ended or differential input to ten single-ended outputs buffer built on advanced metal CMOS technology. The SDR clock buffer fanout from a single or differential input to ten single-ended outputs reduces the loading on the preceding driver and provides an efficient clock distribution network. The IDT5T907 can act as a translator from a differential HSTL, eHSTL, 1.8V/2.5V LVTTTL, LVEPECL, or single-ended 1.8V/2.5V LVTTTL input to HSTL, eHSTL, 1.8V/2.5V LVTTTL outputs. Selectable interface is controlled by 3-level input signals that may be hard-wired to appropriate high-mid-low levels.

The IDT5T907 has two output banks that can be asynchronously enabled/disabled. Multiple power and grounds reduce noise.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Symbol	Description	Max	Unit
V _{DD}	Power Supply Voltage ⁽²⁾	−0.5 to +3.6	V
V _{DDQ}	Output Power Supply ⁽²⁾	−0.5 to +3.6	V
V _I	Input Voltage	−0.5 to +3.6	V
V _O	Output Voltage ⁽³⁾	−0.5 to V _{DDQ} + 0.5	V
V _{REF}	Reference Voltage ⁽³⁾	−0.5 to +3.6	V
T _{STG}	Storage Temperature	−65 to +165	°C
T _J	Junction Temperature	150	°C

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V_{DDQ} and V_{DD} internally operate independently. No power sequencing requirements need to be met.
- Not to exceed 3.6V.

CAPACITANCE⁽¹⁾ (T_A = +25°C, F = 1.0MHz)

Symbol	Parameter	Min	Typ.	Max.	Unit
C _{IN}	Input Capacitance	—	3.5	—	pF

NOTE:

- This parameter is measured at characterization but not tested. Capacitance applies to all inputs except RxS and TxS.

RECOMMENDED OPERATING RANGE

Symbol	Description	Min.	Typ.	Max.	Unit
T _A	Ambient Operating Temperature	−40	+25	+85	°C
V _{DD} ⁽¹⁾	Internal Power Supply Voltage	2.4	2.5	2.6	V
V _{DDQ} ⁽¹⁾	HSTL Output Power Supply Voltage	1.4	1.5	1.6	V
	Extended HSTL and 1.8V LVTTTL Output Power Supply Voltage	1.65	1.8	1.95	V
	2.5V LVTTTL Output Power Supply Voltage		V _{DD}		V
V _T	Termination Voltage		V _{DDQ} / 2		V

NOTE:

- All power supplies should operate in tandem; if V_{DD} or V_{DDQ} is at a maximum, then V_{DDQ} or V_{DD} (respectively) should be at a maximum, and vice-versa.

PIN DESCRIPTION

Symbol	I/O	Type	Description
A	I	Adjustable ⁽¹⁾	Clock input. A is the "true" side of the differential clock input. If operating in single-ended mode, A is the clock input.
$\bar{A}/V_{REF}$	I	Adjustable ⁽¹⁾	Complementary clock input. $\bar{A}/V_{REF}$ is the "complementary" side of A if the input is in differential mode. If operating in single-ended mode, $\bar{A}/V_{REF}$ is connected to GND. For single-ended operation in differential mode, $\bar{A}/V_{REF}$ should be set to the desired toggle voltage for A: 2.5V LVTTTL $V_{REF} = 1250\text{mV}$ 1.8V LVTTTL, eHSTL $V_{REF} = 900\text{mV}$ HSTL $V_{REF} = 750\text{mV}$ LVEPECL $V_{REF} = 1082\text{mV}$
$\overline{G1}$	I	LVTTL ⁽⁵⁾	Gate for outputs Q ₁ through Q ₅ . When $\overline{G1}$ is LOW, these outputs are enabled. When $\overline{G1}$ is HIGH, these outputs are asynchronously disabled to the level designated by GL ⁽⁴⁾ .
$\overline{G2}$	I	LVTTL ⁽⁵⁾	Gate for outputs Q ₆ through Q ₁₀ . When $\overline{G2}$ is LOW, these outputs are enabled. When $\overline{G2}$ is HIGH, these outputs are asynchronously disabled to the level designated by GL ⁽⁴⁾ .
GL	I	LVTTL ⁽⁵⁾	Specifies output disable level. If HIGH, the outputs disable HIGH. If LOW, the outputs disable LOW.
Q _n	O	Adjustable ⁽²⁾	Clock outputs
RxS	I	3 Level ⁽³⁾	Selects single-ended 2.5V LVTTTL (HIGH), 1.8V LVTTTL (MID) clock input or differential (LOW) clock input
TxS	I	3 Level ⁽³⁾	Sets the drive strength of the output drivers to be 2.5V LVTTTL (HIGH), 1.8V LVTTTL (MID) or HSTL (LOW) compatible. Used in conjunction with V _{DDQ} to set the interface levels.
V _{DD}		PWR	Power supply for the device core and inputs
V _{DDQ}		PWR	Power supply for the device outputs. When utilizing 2.5V LVTTTL outputs, V _{DDQ} should be connected to V _{DD} .
GND		PWR	Power supply return for all power

NOTES:

- Inputs are capable of translating the following interface standards. User can select between:
Single-ended 2.5V LVTTTL levels
Single-ended 1.8V LVTTTL levels
or
Differential 2.5V/1.8V LVTTTL levels
Differential HSTL and eHSTL levels
Differential LVEPECL levels
- Outputs are user selectable to drive 2.5V, 1.8V LVTTTL, eHSTL, or HSTL interface levels when used with the appropriate V_{DDQ} voltage.
- 3 level inputs are static inputs and must be tied to V_{DD} or GND or left floating. These inputs are not hot-insertable or over-voltage tolerant.
- Because the gate controls are asynchronous, runt pulses are possible. It is the user's responsibility to either time the gate control signals to minimize the possibility of runt pulses or be able to tolerate them in down stream circuitry.
- Pins listed as LVTTTL inputs will accept 2.5V signals when RxS = HIGH or 1.8V signals when RxS = LOW or MID.

NOTE:

- The INPUT/OUTPUT SELECTION Table describes the total possible combinations of input and output interfaces. Single-Ended (SE) inputs in a single-ended mode require the $\bar{A}/V_{REF}$ pin to be connected to GND. Differential Single-Ended (DSE) is for single-ended operation in differential mode, requiring a V_{REF} . Differential (DIF) inputs are used only in differential mode.

DC ELECTRICAL CHARACTERISTICS OVER OPERATING RANGE

V _{OL}	Output LOW Voltage	I _{OL} = 8mA	—		0.4	V
		I _{OL} = 100μA	—		0.1	V

NOTES:

- See RECOMMENDED OPERATING RANGE table.
- V_{DIF} specifies the minimum input differential voltage (V_{TR} - V_{CP}) required for switching where V_{TR} is the "true" input level and V_{CP} is the "complement" input level. Differential mode only. The DC differential voltage must be maintained to guarantee retaining the existing HIGH or LOW input. The AC differential voltage must be achieved to guarantee switching to a new state.
- V_{CM} specifies the maximum allowable range of (V_{TR} + V_{CP}) / 2. Differential mode only.
- For single-ended operation, in differential mode, $\bar{A}/V_{REF}$ is tied to the DC voltage V_{REF}.
- Voltage required to maintain a logic HIGH, single-ended operation in differential mode.
- Voltage required to maintain a logic LOW, single-ended operation in differential mode.
- Typical values are at V_{DD} = 2.5V, V_{DDQ} = 1.5V, +25°C ambient.
- The reference clock input is capable of HSTL, eHSTL, LVEPECL, 1.8V or 2.5V LVTTTL operation independent of the device output. The correct input interface table should be referenced.
- For differential mode (R_XS = LOW), A and $\bar{A}/V_{REF}$ must be at the opposite rail.

NOTES:

- These power consumption characteristics are for all the valid input interfaces and cover the worst case input and output interface combinations.
- The termination resistors are excluded from these measurements.
- If the differential input interface is used, the true input is held LOW and the complementary input is held HIGH.

DIFFERENTIAL INPUT AC TEST CONDITIONS FOR HSTL

Symbol	Parameter	Value	Units
V _{DIF}	Input Signal Swing ⁽¹⁾	1	V
V _X	Differential Input Signal Crossing Point ⁽²⁾	750	mV
V _{THI}	Input Timing Measurement Reference Level ⁽³⁾	Crossing Point	V
t _R , t _F	Input Signal Edge Rate ⁽⁴⁾	1	V/ns

NOTES:

1. The 1V peak-to-peak input pulse level is specified to allow consistent, repeatable results in an automatic test equipment (ATE) environment. Compliant devices must meet the V_{DIF} (AC) specification under actual use conditions.
2. A 750mV crossing point level is specified to allow consistent, repeatable results in an automatic test equipment (ATE) environment. Compliant devices must meet the V_X specification under actual use conditions.
3. In all cases, input waveform timing is marked at the differential cross-point of the input signals.
4. The input signal edge rate of 1V/ns or greater is to be maintained in the 20% to 80% range of the input waveform.

1. These power consumption characteristics are for all the valid input interfaces and cover the worst case input and output interface combinations.
2. The termination resistors are excluded from these measurements.
3. If the differential input interface is used, the true input is held LOW and the complementary input is held HIGH.

DIFFERENTIAL INPUT AC TEST CONDITIONS FOR 2.5V LVTTTL

Symbol	Parameter	Value	Units
V _{DIF}	Input Signal Swing ⁽¹⁾	V _{DD}	V
V _X	Differential Input Signal Crossing Point ⁽²⁾	V _{DD} /2	V
V _{THI}	Input Timing Measurement Reference Level ⁽³⁾	Crossing Point	V
t _R , t _F	Input Signal Edge Rate ⁽⁴⁾	2.5	V/ns

NOTES:

1. A nominal 2.5V peak-to-peak input pulse level is specified to allow consistent, repeatable results in an automatic test equipment (ATE) environment. Compliant devices must meet the V_{DIF} (AC) specification under actual use conditions.
2. A nominal 1.25V crossing point level is specified to allow consistent, repeatable results in an automatic test equipment (ATE) environment. Compliant devices must meet the V_X specification under actual use conditions.
3. In all cases, input waveform timing is marked at the differential cross-point of the input signals.
4. The input signal edge rate of 2.5V/ns or greater is to be maintained in the 20% to 80% range of the input waveform.

SINGLE-ENDED INPUT AC TEST CONDITIONS FOR 2.5V LVTTTL

V _{IL}	Input LOW Voltage	0	V
V _{THI}	Input Timing Measurement Reference Level ⁽¹⁾	V _{DD} /2	V
t _R , t _F	Input Signal Edge Rate ⁽²⁾	2	V/ns

NOTES:

1. A nominal 1.25V timing measurement reference level is specified to allow constant, repeatable results in an automatic test equipment (ATE) environment.
2. The input signal edge rate of 2V/ns or greater is to be maintained in the 10% to 90% range of the input waveform.

NOTES:

- See RECOMMENDED OPERATING RANGE table.
- For 1.8V LVTTTL single-ended operation, the RxS pin is allowed to float or tied to V_{DD}/2 and $\bar{A}/V_{REF}$ is tied to GND.
- V_{DIF} specifies the minimum input differential voltage (V_{TR} - V_{CP}) required for switching where V_{TR} is the "true" input level and V_{CP} is the "complement" input level. Differential mode only. The DC differential voltage must be maintained to guarantee retaining the existing HIGH or LOW input. The AC differential voltage must be achieved to guarantee switching to a new state.
- V_{CM} specifies the maximum allowable range of (V_{TR} + V_{CP}) / 2. Differential mode only.
- For single-ended operation in differential mode, $\bar{A}/V_{REF}$ is tied to the DC voltage V_{REF}. The input is guaranteed to toggle within ±200mV of V_{REF} when V_{REF} is constrained within +600mV and V_{DDI}-600mV, where V_{DDI} is the nominal 1.8V power supply of the device driving the A input. To guarantee switching in voltage range specified in the JEDEC 1.8V LVTTTL interface specification, V_{REF} must be maintained at 900mV with appropriate tolerances.
- Voltage required to maintain a logic HIGH, single-ended operation in differential mode.
- Voltage required to maintain a logic LOW, single-ended operation in differential mode.
- Typical values are at V_{DD} = 2.5V, V_{DDQ} = 1.8V, +25°C ambient.
- The reference clock input is capable of HSTL, eHSTL, LVEPECL, 1.8V or 2.5V LVTTTL operation independent of the device output. The correct input interface table should be referenced.
- This value is the worst case minimum V_{IH} over the specification range of the 1.8V power supply. The 1.8V LVTTTL specification is V_{IH} = 0.65 • V_{DD} where V_{DD} is 1.8V ± 0.15V. However, the LVTTTL translator is supplied by a 2.5V nominal supply on this part. To ensure compliance with the specification, the translator was designed to accept the calculated worst case value (V_{IH} = 0.65 • [1.8 - 0.15V]) rather than reference against a nominal 1.8V supply.
- This value is the worst case maximum V_{IL} over the specification range of the 1.8V power supply. The 1.8V LVTTTL specification is V_{IL} = 0.35 • V_{DD} where V_{DD} is 1.8V ± 0.15V. However, the LVTTTL translator is supplied by a 2.5V nominal supply on this part. To ensure compliance with the specification, the translator was designed to accept the calculated worst case value (V_{IL} = 0.35 • [1.8 + 0.15V]) rather than reference against a nominal 1.8V supply.
- For differential mode (RxS = LOW), A and $\bar{A}/V_{REF}$ must be at the opposite rail.

NOTES:

1. V_{DDI} is the nominal 1.8V supply (1.8V ± 0.15V) of the part or source driving the input. A nominal 1.8V peak-to-peak input pulse level is specified to allow consistent, repeatable results in an automatic test equipment (ATE) environment. Compliant devices must meet the V_{DIF} (AC) specification under actual use conditions.
2. A nominal 900mV crossing point level is specified to allow consistent, repeatable results in an automatic test equipment (ATE) environment. Compliant devices must meet the V_X specification under actual use conditions.
3. In all cases, input waveform timing is marked at the differential cross-point of the input signals.
4. The input signal edge rate of 1.8V/ns or greater is to be maintained in the 20% to 80% range of the input waveform.

NOTES:

1. Skew measured between all outputs under identical input and output interfaces, transitions, and load conditions on any one device.
2. For 1.8V LVTTTL and eHSTL outputs only.
3. Skew measured is difference between propagation times t_{PLH} and t_{PHL} of any output under identical input and output interfaces, transitions, and load conditions on any one device.
4. For 2.5V LVTTTL outputs only.
5. For HSTL outputs only.
6. Skew measured is the magnitude of the difference in propagation times between any outputs of two devices, given identical transitions and load conditions at identical V_{DD}/V_{DDQ} levels and temperature.
7. Guaranteed by design.

NOTES:

- For differential input mode, RxS is tied to GND.
- Both differential input signals should not be driven to the same level simultaneously. The input will not change state until the inputs have crossed and the voltage range defined by V_{DIF} has been met or exceeded.
- Differential mode only. V_{DIF} specifies the minimum input voltage (V_{TR} - V_{CP}) required for switching where V_{TR} is the "true" input level and V_{CP} is the "complement" input level. The AC differential voltage must be achieved to guarantee switching to a new state.
- For single-ended operation, $\overline{A}/V_{REF}$ is tied to DC voltage (V_{REF}). Refer to each input interface's DC specification for the correct V_{REF} range.
- Voltage required to switch to a logic HIGH, single-ended operation only.
- Voltage required to switch to a logic LOW, single-ended operation only.

AC TIMING WAVEFORMS

Propagation and Skew Waveforms

NOTES:

- t_{PHL} and t_{PLH} signals are measured from the input passing through V_{THI} or input pair crossing to Q_n passing through V_{THO} .
- Pulse Skew is calculated using the following expression:

$$t_{SK(P)} = |t_{PHL} - t_{PLH}|$$

where t_{PHL} and t_{PLH} are measured on the controlled edges of any one output from rising and falling edges of a single pulse. Please note that the t_{PHL} and t_{PLH} shown are not valid measurements for this calculation because they are not taken from the same pulse.

Gate Disable/Enable Showing Runt Pulse Generation

NOTE:

As shown, it is possible to generate runt pulses on gate disable and enable of the outputs. It is the user's responsibility to time their $\bar{G}_x$ signals to avoid this problem.
