PM-7545/PM-7645

ABSOLUTE MAXIMUM RATINGS ($T_A = +25^\circ\text{C}$, unless otherwise noted.)

V_{DD} to DGND	−0.3, +17V
Digital Input Voltage to DGND	−0.3, V_{DD}
AGND to DGND	−0.3, V_{DD}
V_{REF} , V_{REF} to DGND	±25V
V_{PIN1} to DGND	−0.3, V_{DD}
Operating Temperature Range	
Military (AR, BR) Grades	−55°C to +125°C
Industrial (ER, FR, FP, FPC, FS) Grades	−40°C to +85°C
Commercial (GP) Grade	0°C to +70°C
Junction Temperature	+150°C
Storage Temperature	−65°C to +150°C
Lead Temperature (Soldering, 60 sec)	+300°C

PACKAGE TYPE	θ_{JA} (Note 1)	θ_{JC}	UNITS
20-Pin Hermetic DIP (R)	76	11	°C/W
20-Pin Plastic DIP (P)	69	27	°C/W
20-Contact LCC (RC, TC)	88	33	°C/W
20-Pin SOL (S)	88	25	°C/W
20-Contact PLCC (PC)	73	33	°C/W

NOTE:

1. θ_{JA} is specified for worst case mounting conditions, i.e., θ_{JA} is specified for device in socket for CerDIP, P-DIP, and LCC packages; θ_{JA} is specified for device soldered to printed circuit board for SOL and PLCC packages.

CAUTION:

1. Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation at or above this specification is not implied. Exposure to above maximum rating conditions for extended periods may affect device reliability.
2. Do not apply voltages higher than V_{DD} or less than GND potential on any terminal except V_{REF} .
3. The digital inputs are zener protected, however, permanent damage may occur on unprotected units from high-energy electrostatic fields. Keep units in conductive foam at all times until ready to use. Use proper antistatic handling procedures.
4. Remove power before inserting or removing units from their sockets.

ELECTRICAL CHARACTERISTICS at $V_{DD} = +5V$, $V_{REF} = +10V$, $V_{OUT} = 0V$, AGND = DGND = 0V; $T_A = -55^\circ\text{C}$ to $+125^\circ\text{C}$ apply for PM-7545AR/BR; $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$ apply for PM-7545ER/FR/FP/FPC/FS; $T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$ apply for PM-7545GP, unless otherwise noted. 15V operating characteristics are shown on the following pages.

PARAMETER DEFINITIONS

RELATIVE ACCURACY

Sometimes referred to as endpoint nonlinearity, and is a measure of the maximum deviation from a straight line passing through the endpoints of the DAC transfer function. Relative Accuracy is measured after the zero and full-scale points have been adjusted, and is normally expressed in LSB or as a percentage of full scale.

DIFFERENTIAL NONLINEARITY

This is the difference between the measured change and the ideal change between any two adjacent codes. A differential nonlinearity of ± 1 LSB maximum over the full operating temperature range will ensure that a device is monotonic (the output will increase for an increase in digital code applied).

GAIN ERROR

Gain or full scale error is the amount of output error between the ideal output and the actual output. The ideal output is V_{REF} minus 1 LSB. The gain error is adjustable to zero using external resistance.

OUTPUT CAPACITANCE

The capacitance from OUT to AGND.

PROPAGATION DELAY

This is measured from the digital input change to the analog output current reaching 90% of its final value.

DIGITAL CHARGE INJECTION

This is a measure of the amount of charge injected to the analog output from the digital inputs, when the digital inputs change states. It is the area of the glitch and is specified in nVsec; it is measured with $V_{REF} = AGND$.

BURN-IN CIRCUIT

LOGIC INFORMATION

WRITE CYCLE TIMING DIAGRAM

D/A CONVERTER SECTION

FIGURE 1: Simplified D/A Circuit of PM-7545

Figure 1 shows a simplified circuit of the D/A Converter section and Figure 2 gives an approximate equivalent switch circuit. R is typically 11k Ω .

The binary-weighted currents are switched between OUT and AGND by N-channel switches, thus maintaining a constant current in each ladder leg independent of the switch state.

The capacitance at the OUT terminal, C_{OUT} , is code dependent and varies from 70pF (all switches to AGND) to 150pF (all switches to OUT). One of the current switches is shown in Figure 2.

The input resistance at V_{REF} (Figure 1) is always equal to R_{LDR} (R_{LDR} is the R/2R ladder characteristics resistance and is equal to value "R"). Since the input resistance at the V_{REF} pin is constant, the reference terminal can be driven by a reference voltage or a reference current, ac or dc, of positive or negative polarity. (If a current source is used, a low-temperature-coefficient external R_{PR} is recommended to define scale factor.)

The internal feedback resistor (R_{FB}) has a normally closed switch in series as shown in Figure 1. This switch improves performance over temperature and power supply rejection; however when the circuit is not powered up the switch assumes an open state.

FIGURE 2: N-Channel Current Steering Switch

DIGITAL SECTION

Figure 3 shows the digital structure for one bit. The digital signals $\overline{\text{CONTROL}}$ and $\overline{\text{CONTROL}}$ are generated from CS and WR.

FIGURE 3: Digital Input Structure

The input buffers are simple CMOS inverters designed such that when the PM-7545 is operated with $V_{DD} = 5V$, the buffers convert TTL input levels (2.4V and 0.8V) into CMOS logic levels. When the digital input is in the region of 1.0 volts to 6.0 volts, the input buffers operate in their linear region and draw current from the power supply. To minimize power supply currents, it is recommended that the digital input voltages be as close to the supply rails (V_{DD} and DGND) as is practically possible. The PM-7545 may be operated with any supply voltage in the range $5 \leq V_{DD} \leq 15$ volts. With $V_{DD} = +15V$, the input logic levels are CMOS compatible only, i.e., 1.5V and 13.5V. The PM-7645 operates with $V_{DD} = 15V$ only; the buffers convert TTL input levels (2.4V and 0.8V) into CMOS logic levels.

BASIC APPLICATIONS

Figures 4 and 5 show simple unipolar and bipolar circuits using the PM-7545/PM-7645. Resistor R1 is used to trim for full scale. The following versions (PM-7545AR, PM-7545ER, PM-7545GP) have a guaranteed maximum gain error of ± 1 LSB at $+25^\circ C$ and $V_{DD} = +5V$, and in many applications the gain trim resistors are

not required. Capacitor C1 provides phase compensation and helps prevent overshoot and ringing when using high speed op amps. The circuits of Figures 4 and 5 have constant input impedance at the V_{REF} terminal.

The circuit of Figure 4 can either be used as a fixed reference D/A converter so that it provides an analog output voltage in the range 0 to $-V_{IN}$ (the inversion is introduced by the op amp); or V_{IN} can be an ac signal in which case the circuit behaves as an attenuator (2-Quadrant Multiplier). V_{IN} can be any voltage in the range $-20 \leq V_{IN} \leq +20$ volts (provided the op amp can handle such voltages) since V_{REF} is permitted to exceed V_{DD} . Table 2 shows the code relationship for the circuit of Figure 4.

FIGURE 4: Unipolar Binary Operation

0000	0000	0000	0 Volts

PM-7545/PM-7645

Figure 5 and Table 3 illustrate the recommended circuit and code relationship for bipolar operation. The D/A function itself uses offset binary code. The inverter U₁ on the MSB line, converts 2's-complement input code to offset binary code. The inverter U₁ may be omitted if the inversion is done in software.

R3, R4 and R5 must match within 0.01% and should be the same type of resistors (preferably wire-wound or metal foil), so that their temperature coefficients match. Mismatch of R3 value to R4 causes both offset and full scale error. Mismatch of R5 to R4 and R3 causes full scale error.

TABLE III: 2's Complement Code Table for Circuit of Figure 5

DATA INPUT			ANALOG OUTPUT
0111	1111	1111	$+V_{IN} \cdot \left\{ \frac{2047}{2048} \right\}$
0000	0000	0001	$+V_{IN} \cdot \left\{ \frac{1}{2048} \right\}$
0000	0000	0000	0 Volts
1111	1111	1111	$-V_{IN} \cdot \left\{ \frac{1}{2048} \right\}$
1000	0000	0000	$-V_{IN} \cdot \left\{ \frac{2048}{2048} \right\}$

APPLICATION HINTS

Output Offset: CMOS D/A converters exhibit a code-dependent output resistance that causes a code-dependent error voltage at the output of the amplifier. The maximum amplitude of this offset, which adds to the D/A converter nonlinearity, is 0.67 V_{OS} where V_{OS} is the amplifier input-offset voltage. To maintain monotonic operation, it is recommended that V_{OS} be no greater than 10% of 1 LSB over the temperature range of operation.

General Ground Management: AC or transient voltages between AGND and DGND can cause noise injection into the analog output. The simplest method of ensuring that voltages at AGND and DGND are equal is to tie AGND and DGND together at the PM-7545/PM-7645. It is recommended that two diodes (1N914 or equivalent) be connected in inverse parallel between AGND and DGND pins in complex systems where AGND and DGND tie on the backplane.

Digital Glitches: When $\overline{WR}$ and $\overline{CS}$ are both low, the latches are transparent and the D/A converter inputs follow the data inputs. Some bus systems do not always have data valid for the whole period during which $\overline{WR}$ is low. This will allow invalid data to briefly appear at the DAC inputs during the write cycle. This can cause unwanted glitches at the DAC output. Retiming the write pulse $\overline{WR}$, so that it only occurs when data is valid, will eliminate the problem.

INTERFACING THE PM-7545/PM-7645 TO MICROPROCESSORS

The PM-7545 can be directly interfaced to either an 8 or 16-bit microprocessor via its 12-bit wide data latch using the $\overline{CS}$ and $\overline{WR}$ control signals.

An 8-bit processor interface configuration is shown in Figure 6. It uses two memory addresses, one for the lower 8-bits and one for the upper 4-bits of data into the DAC via the latch.

FIGURE 6: 8-Bit Processor to PM-7545/7645 Interface

Connection to an 8-bit processor with a full 16-bit wide address bus (such as the 6800, 8080, Z80) is shown in Figure 7. The 12 lower address lines are fed directly to the PM-7545; this allows the PM-7545 to use 4k bytes for its address location. The address field of the instruction is organized so that the lower 12-bits contain the DAC data. Data is written into the DAC using a single write instruction.
