

MC33464

Micropower Undervoltage Sensing Circuits

The MC33464 series are micropower undervoltage sensing circuits that are specifically designed for use with battery powered microprocessor based systems, where extended battery life is required. A choice of several threshold voltages from 0.9 V to 4.5 V are available. These devices feature a very low quiescent bias current of 0.8 μ A typical.

The MC33464 series features a highly accurate voltage reference, a comparator with precise thresholds and built-in hysteresis to prevent erratic reset operation, a choice of output configurations between open drain or complementary MOS, and guaranteed operation below 1.0 V with extremely low standby current. These devices are available in either SOT-89 3-pin or SOT-23 5-pin surface mount packages.

Applications include direct monitoring of the MPU/logic power supply used in portable, appliance, automotive and industrial equipment.

MC33464 Features:

- Extremely Low Standby Current of 0.8 μ A at $V_{in} = 1.5$ V
- Wide Input Voltage Range (0.7 V to 10 V)
- Monitors Power Supply Voltages from 1.1 V to 5.0 V
- High Accuracy Detector Threshold ($\pm 2.5\%$)
- Two $\overline{\text{Reset}}$ Output Types (Open Drain or Complementary Drive)
- Two Surface Mount Packages (SOT-89 or SOT-23 5-Pin)

NOTES: 1. Low duty pulse techniques are used during test to maintain junction temperature as close to ambient as possible.

2. Propagation delay time is measured from the rising or falling edge of the input voltage to the point where the output voltage has transitioned to 50% of its final value.

Figure 7. Microprocessor Reset Circuit with Delay

A time delayed reset can be accomplished with the addition of C_{Delay}. Figure 5 provides a graph of time delays, for both rising and falling output waveform edges, as a function of C_{Delay}. If another value of pullup resistance is used, the time delay can be calculated by using the equation:

$$t_{\text{Delay}} = R C_{\text{Delay}} \left[\frac{1}{\left(1 - \frac{V_{\text{th(MPU)}}}{V_{\text{in}}} \right)} \right] + t_p$$

where V_{thMPU} is the microprocessor reset input threshold voltage and t_p is the propagation delay internal to the MC33464.
