To all our customers

Regarding the change of names mentioned in the document, such as Mitsubishi Electric and Mitsubishi XX, to Renesas Technology Corp.

The semiconductor operations of Hitachi and Mitsubishi Electric were transferred to Renesas Technology Corporation on April 1st 2003. These operations include microcomputer, logic, analog and discrete devices, and memory chips other than DRAMs (flash memory, SRAMs etc.) Accordingly, although Mitsubishi Electric, Mitsubishi Electric Corporation, Mitsubishi Semiconductors, and other Mitsubishi brand names are mentioned in the document, these names have in fact all been changed to Renesas Technology Corp. Thank you for your understanding. Except for our corporate trademark, logo and corporate statement, no changes whatsoever have been made to the contents of the document, and these changes do not constitute any alteration to the contents of the document itself.

Note : Mitsubishi Electric will continue the business operations of high frequency & optical devices and power devices.

M306H2FCFP

SINGLE-CHIP 16-BIT CMOS MICROCOMPUTER
with DATA ACQUISITION CONTROLLER

1. DESCRIPTION

The M306H2FCFP is single-chip microcomputer using the high-performance silicon gate CMOS process using a M16C/60 Series CPU core and is packaged in a 116-pin plastic molded QFP. This single-chip microcomputer operates using sophisticated instructions featuring a high level of instruction efficiency. With 1M bytes of address space, this is capable of executing instructions at high speed. This also features a built-in data acquisition circuit, making this correspondence to Teletext broadcasting service.

1.1 Features

- Memory capacity ..... <ROM>128K bytes
  <RAM>5K bytes
- Shortest instruction execution time ..... 100 ns (f(X_{IN})=10 MHz)
- Supply voltage ..... 4.75 V to 5.25V(at f(X_{IN})=10 MHz)
  2.80V to 5.25V(at f(X_{CIN})=32kHz, only in low power dissipation mode)
- Interrupts ..... 25 internal and 8 external interrupt sources, 4 software interrupt sources; 7 levels (Including key input interrupt)
- Multifunction 16-bit timer ..... 5 output timers + 6 input timers
- Serial I/O ..... 5 channels
  UART/clock synchronous: 3
  Clock synchronous: 2
- DMAC ..... 2 channels (trigger: 24 sources)
- A-D converter ..... 8 bits X 8 channels (Expandable up to 10 channels)
- D-A converter ..... 8 bits X 2 channels
- CRC calculation circuit ..... 1 circuit
- Watchdog timer ..... 1 line
- Programmable I/O ..... 87 lines
- Input port ..... 1 port ($P8_5$ shared with $\overline{NMI}$ pin)
- Output port ..... 1 port (P11 shared with SLICEON pin)
- Chip select output ..... 4 lines
- Clock generating circuit ..... 2 built-in circuits
  (built-in feedback resistor, and external ceramic or crystal oscillator)
- Data acquisition circuit ..... For PDC, VPS, EPG-J, XDS and WSS

1.2 Applications

VCR, etc

Table of contents

1.3 Pin Configuration

Figures 1.3.1 shows the pin configuration (top view).

1.5 Performance Outline

Table 1.5.1 is a performance outline of M306H2FCFP.

Table 1.5.1 Performance outline of M306H2FCFP

Item		Performance
Number of basic instructions		91 instructions
Shortest instruction execution time		100ns (f(XIN)=10MHz)
Memory capacity	ROM	128K bytes
	RAM	5K bytes
I/O port	P0 to P10 (except P85)	8 bits × 10, 7 bits × 1
Input port	P85	1 bit × 1
Output port	P11	1 bit × 1
Multifunction timer	TA0, TA1, TA2, TA3, TA4	16 bits × 5
	TB0, TB1, TB2, TB3, TB4, TB5	16 bits × 6
Serial I/O	UART0, UART1, UART2	(UART or clock synchronous) x 3
	SI/O3, SI/O4	(Clock synchronous) x 2
A-D converter		8 bits × (8 + 2) channels
D-A converter		8 bits × 2 channels
DMAC		2 channels (trigger: 24 sources)
CRC calculation circuit		CRC-CCITT
Watchdog timer		15 bits × 1 (with prescaler)
Interrupt		25 internal and 8 external sources, 4 software sources, 7 levels
Clock generating circuit		2 built-in clock generation circuits (built-in feedback resistor, and external ceramic or crystal oscillator)
Supply voltage		4.75V to 5.25V (at f(XIN)=10MHz) 2.80V to 5.25V(at f(XCIN)=32kHz, Only low power dissipation mode)
Device configuration		CMOS high performance silicon gate
Package		116-pin plastic mold QFP
Data acquisition	Slice RAM	864 Bytes (48 × 18 × 8-bit)
	Data acquisition circuit	for PDC, VPS, EPG-J, XDS and WSS

Table 1.5.2 Pin Description

Pin name	Signal name	I/O type	Function
V_{CC}, V_{SS}	Power supply input		Supply 4.75 to 5.25 V to the Vcc pin. Supply 0 V to the Vss pin.
CNV$_{SS}$	CNV$_{SS}$	Input	Connect this pin to V_{SS}.
$\overline{RESET}$	Reset input	Input	A "L" on this input resets the microcomputer.
X_{IN} X_{OUT}	Clock input Clock output	Input Output	These pins are provided for the main clock generating circuit. Connect a ceramic resonator or crystal between the X_{IN} and the X_{OUT} pins. To use an externally derived clock, input it to the X_{IN} pin and leave the X_{OUT} pin open.
BYTE	External data bus width select input	Input	This pin selects the width of an external data bus. A 16-bit width is selected when this input is "L"; an 8-bit width is selected when this input is "H". This input must be fixed to either "H" or "L". Connect this pin to the V_{SS} pin when not using external data bus.
AV$_{CC}$	Analog power supply input		This pin is a power supply input for the A-D converter. Connect this pin to V_{CC}.
AV$_{SS}$	Analog power supply input		This pin is a power supply input for the A-D converter. Connect this pin to V_{SS}.
V_{REF}	Reference voltage input	Input	This pin is a reference voltage input for the A-D converter.
P0$_0$ to P0$_7$	I/O port P0	Input/output	This is an 8-bit CMOS I/O port. It has an input/output port direction register that allows the user to set each pin for input or output individually. When used for input in signal-chip mode, the port can be set to have or not have a pull-up resistor in units of four bits by software. In memory expansion mode, selection of the internal pull-resistor in not available.
D$_0$ to D$_7$		Input/output	When set as a separate bus, these pins input and output data (D$_0$–D$_7$).
P1$_0$ to P1$_7$	I/O port P1	Input/output	This is an 8-bit I/O port equivalent to P0. Pins in this port also function as external interrupt pins as selected by software.
D$_8$ to D$_{15}$		Input/output	When set as a separate bus, these pins input and output data (D$_8$–D$_{15}$).
P2$_0$ to P2$_7$	I/O port P2	Input/output	This is an 8-bit I/O port equivalent to P0.
A$_0$ to A$_7$		Output	These pins output 8 low-order address bits (A$_0$–A$_7$).
A$_0$/D$_0$ to A$_7$/D$_7$		Input/output	If the external bus is set as an 8-bit wide multiplexed bus, these pins input and output data (D$_0$–D$_7$) and output 8 low-order address bits (A$_0$–A$_7$) separated in time by multiplexing.
A$_0$, A$_1$/D$_0$ to A$_7$/D$_6$		Output Input/output	If the external bus is set as a 16-bit wide multiplexed bus, these pins input and output data (D$_0$–D$_6$) and output address (A$_1$–A$_7$) separated in time by multiplexing. They also output address (A$_0$).
P3$_0$ to P3$_7$	I/O port P3	Input/output	This is an 8-bit I/O port equivalent to P0.
A$_8$ to A$_{15}$		Output	These pins output 8 middle-order address bits (A$_8$–A$_{15}$).
A$_8$/D$_7$, A$_9$ to A$_{15}$		Input/output Output	If the external bus is set as a 16-bit wide multiplexed bus, these pins input and output data (D$_7$) and output address (A$_8$) separated in time by multiplexing. They also output address (A$_9$–A$_{15}$).
P4$_0$ to P4$_7$	I/O port P4	Input/output	This is an 8-bit I/O port equivalent to P0.
$\overline{CS_0}$ to $\overline{CS_3}$, A$_{16}$ to A$_{19}$		Output Output	These pins output $\overline{CS_0}$–$\overline{CS_3}$ signals and A$_{16}$–A$_{19}$. $\overline{CS_0}$–$\overline{CS_3}$ are chip select signals used to specify an access space. A$_{16}$–A$_{19}$ are 4 high-order address bits.

Table 1.5.3 Pin Description

Pin name	Signal name	I/O type	Function
P5$_0$ to P5$_7$	I/O port P5	Input/output	This is an 8-bit I/O port equivalent to P0. In single-chip mode, P5$_7$ in this port outputs a divide-by-8 or divide-by-32 clock of XIN or a clock of the same frequency as XCIN as selected by software.
$\overline{WRL}$ / $\overline{WR}$, $\overline{WRH}$ / $\overline{BHE}$, $\overline{RD}$, $\overline{BCLK}$, $\overline{HLDA}$, HOLD, $\overline{ALE}$, $\overline{RDY}$		Output Output Output Output Output Input Output Input	Output $\overline{WRL}$, $\overline{WRH}$ ($\overline{WR}$ and $\overline{BHE}$), $\overline{RD}$, $\overline{BCLK}$, $\overline{HLDA}$, and ALE signals. $\overline{WRL}$ and $\overline{WRH}$, and $\overline{BHE}$ and WR can be switched using software control. ■ $\overline{WRL}$, $\overline{WRH}$, and $\overline{RD}$ selected With a 16-bit external data bus, data is written to even addresses when the $\overline{WRL}$ signal is "L" and to the odd addresses when the $\overline{WRH}$ signal is "L". Data is read when $\overline{RD}$ is "L". ■ $\overline{WR}$, $\overline{BHE}$, and $\overline{RD}$ selected Data is written when WR is "L". Data is read when $\overline{RD}$ is "L". Odd addresses are accessed when $\overline{BHE}$ is "L". Use this mode when using an 8-bit external data bus. While the input level at the $\overline{HOLD}$ pin is "L", the microcomputer is placed in the hold state. While in the hold state, $\overline{HLDA}$ outputs a "L" level. ALE is used to latch the address. While the input level of the RDY pin is "L", the microcomputer is in the ready state.
P6$_0$ to P6$_7$	I/O port P6	Input/output	This is an 8-bit I/O port equivalent to P0. When used input in singlechip and memory expansion modes, the port can be set to have or not have a pull-up resistor in units of four bits by software. Pins in this port also function as UART0 and UART1 I/O pins as selected by software.
P7$_0$ to P7$_7$	I/O port P7	Input/output	This is an 8-bit I/O port equivalent to P6 (P7$_0$ and P7$_1$ are N channel open-drain output). Pins in this port also function as timer A$_0$–A$_3$, timer B5 or UART2 I/O pins as selected by software.
P8$_0$ to P8$_4$, P8$_6$, P8$_7$, P8$_5$	I/O port P8 I/O port P8$_5$	Input/output Input/output Input/output Input	P8$_0$ to P8$_4$, P8$_6$, and P8$_7$ are I/O ports with the same functions as P6. Using software, they can be made to function as the I/O pins for timer A4 and the input pins for external interrupts. P8$_6$ and P8$_7$ can be set using software to function as the I/O pins for a sub clock generation circuit. In this case, connect a quartz oscillator between P8$_6$ (XCOUT pin) and P8$_7$ ($\overline{XCIN}$ pin). P8$_5$ is an input-only port that also functions for NMI. The NMI interrupt is generated when the input at this pin changes from "H" to "L". The NMI function cannot be cancelled using software. The pull-up cannot be set for this pin.
P9$_0$ to P9$_7$	I/O port P9	Input/output	This is an 8-bit I/O port equivalent to P6. Pins in this port also function as SI/O3, 4 I/O pins, Timer B0–B4 input pins, D-A converter output pins, A-D converter extended input pins, or A-D trigger input pins as selected by software.
P10$_0$ to P10$_7$	I/O port P10	Input/output	This is an 8-bit I/O port equivalent to P6. Pins in this port also function as A-D converter input pins. Furthermore, P10$_4$–P10$_7$ also function as input pins for the key input interrupt function.
P11	Output port P11	Output	This is a 1-bit output-only port. Pins in this port also function as SLICEON output pins as selected by software.

Table 1.5.4 Pin Description

Pin name	Signal name	I/O type	Function
$V_{DD}1$, $V_{SS}1$	Power supply input		Digital power supply pin. Supply 4.75 to 5.25 V to the $V_{DD}1$ pin. Supply 0 V to the $V_{SS}1$ pin.
$V_{DD}2$, $V_{SS}2$	Power supply input		Analog power supply pin. Supply 4.75 to 5.25 V to the $V_{DD}2$ pin. Supply 0 V to the $V_{SS}2$ pin
$V_{DD}3$, $V_{SS}3$	Power supply input		Analog power supply pin. Supply 4.75 to 5.25 V to the $V_{DD}3$ pin. Supply 0 V to the $V_{SS}3$ pin
SVREF	Synchronous slice level input	Input	When slice the vertical synchronous signal, input slice power.
CVIN1	Composite video signal input 1	Input	This pin inputs the external composite video signal. Data slices this signal internally by setting.
SYNCIN	Composite video signal input 2	Input	This pin inputs the external composite video signal. Synchronous devides this signal internally.
M1	Chip mode setting input	Input	Usually, supply 0 V to the pin.
LP2	Filter output 1	Output	This is a filter output pin 1 (for f_{SC}).
LP3	Filter output 2	Output	This is a filter output pin 2 (for VPS).
LP4	Filter output 3	Output	This is a filter output pin 3 (for PDC).
FSCIN	fsc input pin for synchronous signal generation	Input	Sub-carrier (fsc) input pin for synchronous signal generation.
M2	Power supply input for flash rewriting	Input	It is power supply input pin for rewriting of built-in flash memory. Usually supply 0V to M2 pin, and supply 4.75-5.25V at the time of rewriting of built-in flash memory.

2. OPERATION OF FUNCTIONAL BLOKS

The M306H2MC-XXXFP accommodates certain units in a single chip. These units include RAM to store instructions and data and the central processing unit (CPU) to execute arithmetic/logic operations. Also included are peripheral units such as timers, serial I/O, D-A converter, DMAC, CRC calculation circuit, A-D converter, Data slicer circuit and I/O ports.
The following explains each unit.

2.1 Memory

Figure 2.1.1 is a memory map of the M306H2MC-XXXFP. The address space extends the 1M bytes from address 00000_{16} to $FFFFF_{16}$. From address $FFFFF_{16}$ down is ROM. In the M306H2MC-XXXFP, can use from address from $E0000_{16}$ to $FFFFF_{16}$ as 128K bytes internal ROM area. The vector table for fixed interrupts such as the reset and $\overline{NMI}$ are mapped to from address $FFFDC_{16}$ to $FFFFF_{16}$. The starting address of the interrupt routine is stored here. The address of the vector table for timer interrupts, etc., can be set as desired using the internal register (INTB). See the section on interrupts for details.
5K bytes of internal RAM is mapped to from address 00400_{16} to $017FF_{16}$. In addition to storing data, the RAM also stores the stack used when calling subroutines and when interrupts are generated.
The SFR area is mapped to from address 00000_{16} to $003FF_{16}$. This area accommodates the control registers for peripheral devices such as I/O ports, A-D converter, serial I/O, and timers, etc. Figures 2.1.2 to 2.1.4 are location of peripheral unit control registers. Any part of the SFR area that is not occupied is reserved and cannot be used for other purposes.
The special page vector table is mapped to from address $FFE00_{16}$ to $FFFDB_{16}$. If the starting addresses of subroutines or the destination addresses of jumps are stored here, subroutine call instructions and jump instructions can be used as 2-byte instructions, reducing the number of program steps.
In memory expansion mode, a part of the spaces are reserved and cannot be used. The following spaces cannot be used.

- The space between 01800_{16} and $03FFF_{16}$ (memory expansion mode)
- The space between $D0000_{16}$ and $DFFFF_{16}$ (memory expansion mode)

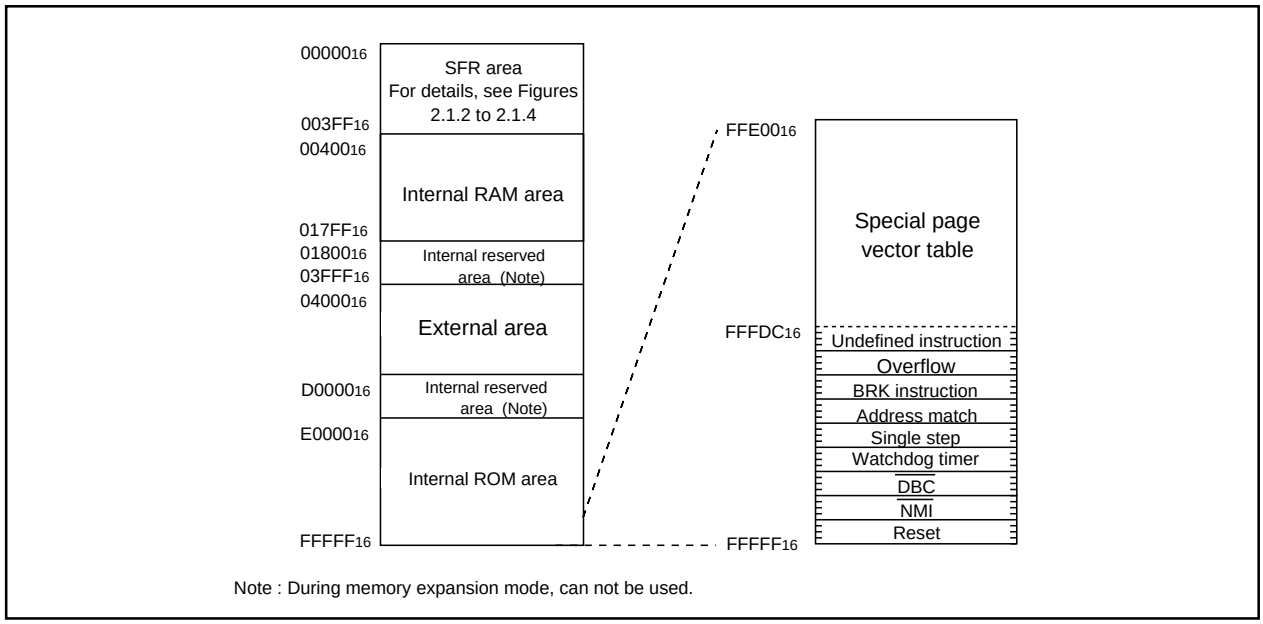

Figure 2.1.1 Memory map

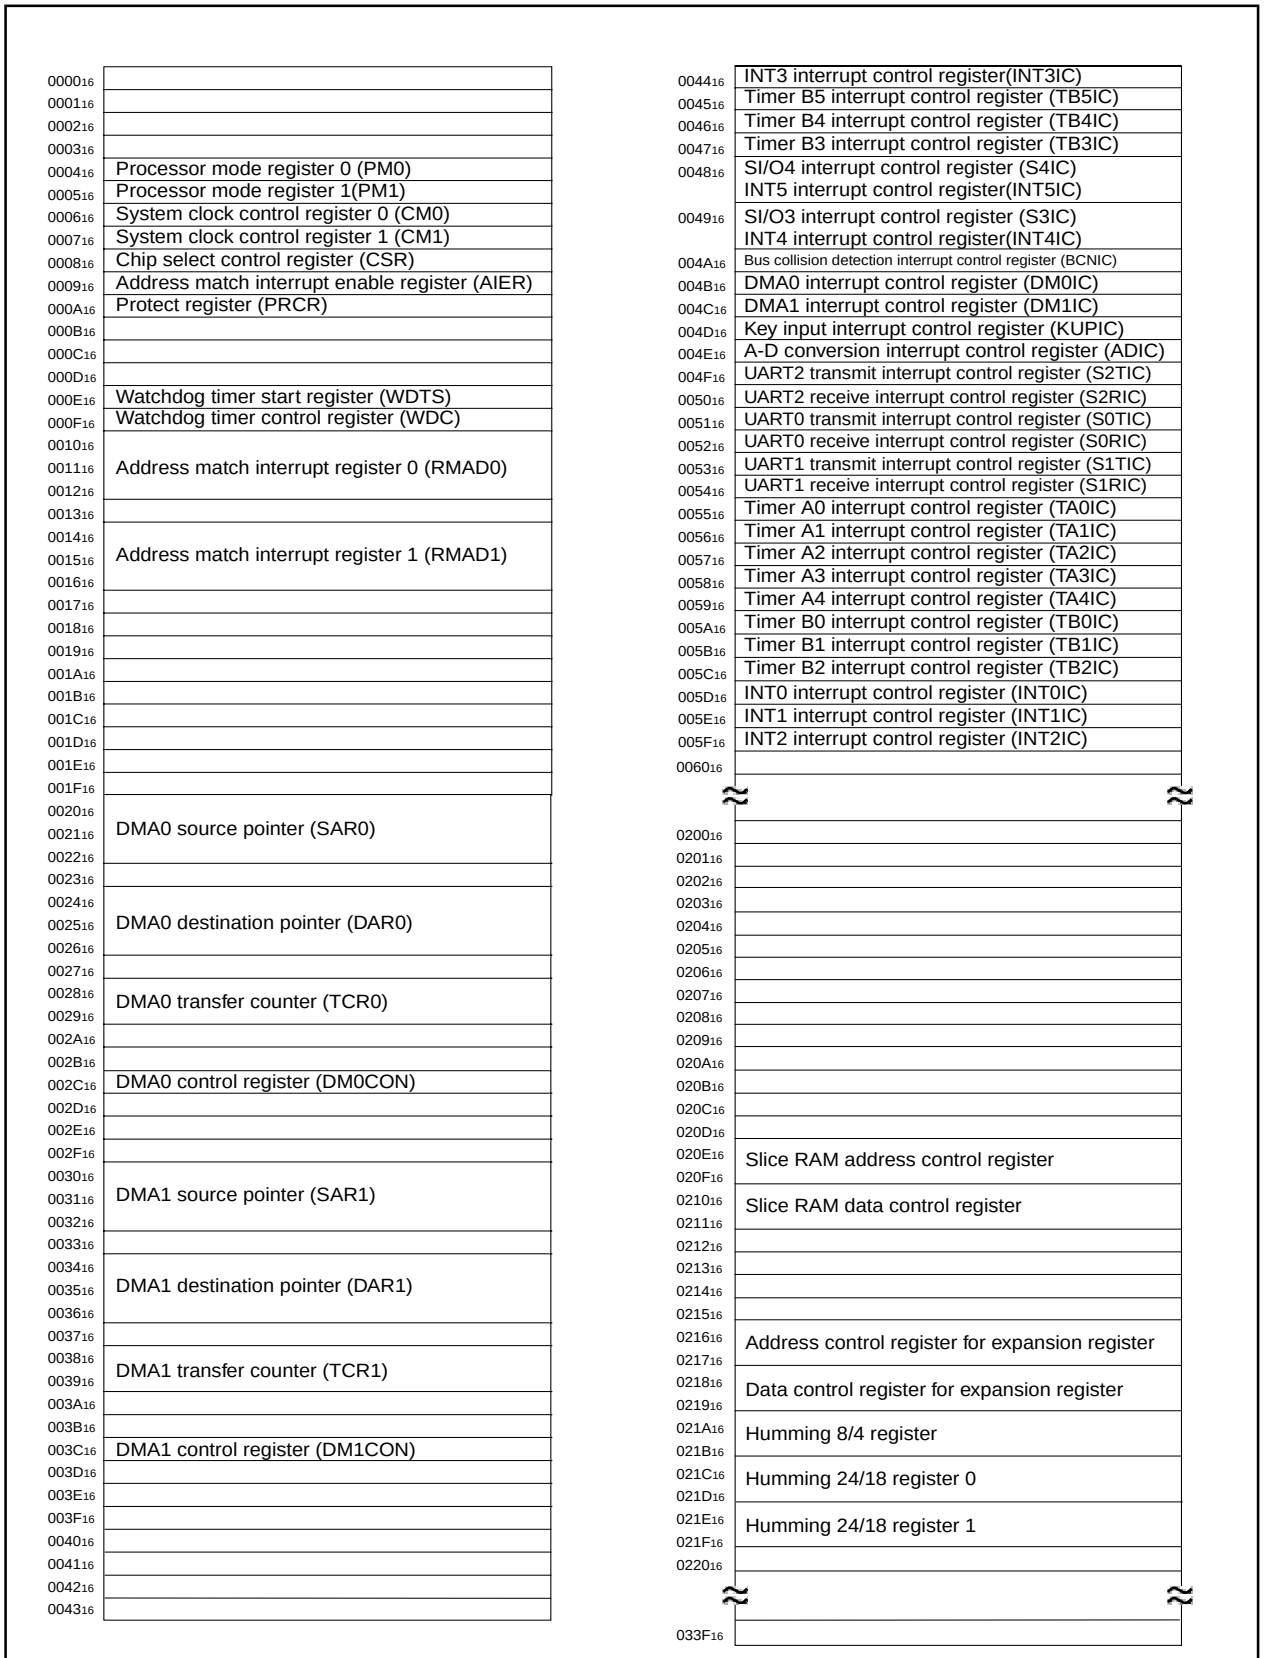

Note: Location in the SFR area where nothing is allocated are reserved. Do not access these areas for read or write.

Note: Locations in the SFR area where nothing is allocated are reserved areas. Do not access these areas for read or write.

Figure 2.1.4 Location of peripheral unit control registers (3)

2.2 Central Processing Unit (CPU)

The CPU has 13 registers shown in Figure 2.2.1. Seven of these registers (R0, R1, R2, R3, A0, A1, and FB) come in two sets; therefore, these have two register banks.

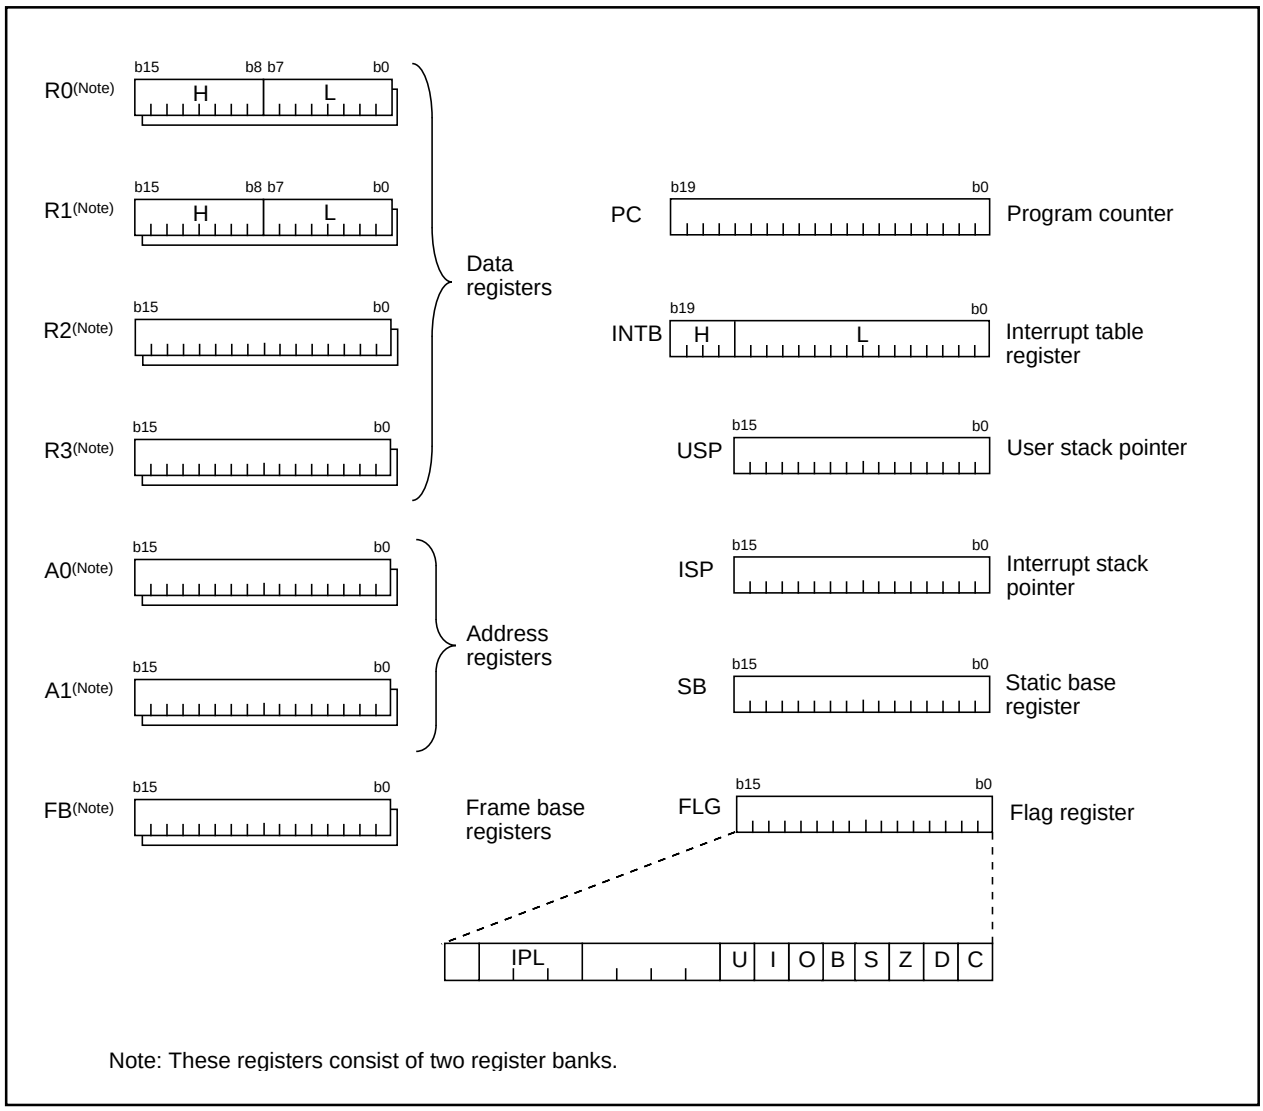

Figure 2.2.1 Central processing unit register

(1) Data registers (R0, R0H, R0L, R1, R1H, R1L, R2, and R3)

Data registers (R0, R1, R2, and R3) are configured with 16 bits, and are used primarily for transfer and arithmetic/logic operations.

Registers R0 and R1 each can be used as separate 8-bit data registers, high-order bits as (R0H/R1H), and low-order bits as (R0L/R1L). In some instructions, registers R2 and R0, as well as R3 and R1 can use as 32-bit data registers (R2R0/R3R1).

(2) Address registers (A0 and A1)

Address registers (A0 and A1) are configured with 16 bits, and have functions equivalent to those of data registers. These registers can also be used for address register indirect addressing and address register relative addressing.

In some instructions, registers A1 and A0 can be combined for use as a 32-bit address register (A1A0).

(3) Frame base register (FB)

Frame base register (FB) is configured with 16 bits, and is used for FB relative addressing.

(4) Program counter (PC)

Program counter (PC) is configured with 20 bits, indicating the address of an instruction to be executed.

(5) Interrupt table register (INTB)

Interrupt table register (INTB) is configured with 20 bits, indicating the start address of an interrupt vector table.

(6) Stack pointer (USP/ISP)

Stack pointer comes in two types: user stack pointer (USP) and interrupt stack pointer (ISP), each configured with 16 bits.

Your desired type of stack pointer (USP or ISP) can be selected by a stack pointer select flag (U flag). This flag is located at the position of bit 7 in the flag register (FLG).

(7) Static base register (SB)

Static base register (SB) is configured with 16 bits, and is used for SB relative addressing.

(8) Flag register (FLG)

Flag register (FLG) is configured with 11 bits, each bit is used as a flag. Figure 2.2.2 shows the flag .register (FLG). The following explains the function of each flag:

- **Bit 0: Carry flag (C flag)**
  This flag retains a carry, borrow, or shift-out bit that has occurred in the arithmetic/logic unit.
- **Bit 1: Debug flag (D flag)**
  This flag enables a single-step interrupt.
  When this flag is “1”, a single-step interrupt is generated after instruction execution. This flag is cleared to “0” when the interrupt is acknowledged.
- **Bit 2: Zero flag (Z flag)**
  This flag is set to “1” when an arithmetic operation resulted in 0; otherwise, cleared to “0”.
- **Bit 3: Sign flag (S flag)**
  This flag is set to “1” when an arithmetic operation resulted in a negative value; otherwise, cleared to “0”.
- **Bit 4: Register bank select flag (B flag)**
  This flag chooses a register bank. Register bank 0 is selected when this flag is “0” ; register bank 1 is selected when this flag is “1”.
- **Bit 5: Overflow flag (O flag)**
  This flag is set to “1” when an arithmetic operation resulted in overflow; otherwise, cleared to “0”.
- **Bit 6: Interrupt enable flag (I flag)**
  This flag enables a maskable interrupt.
  An interrupt is disabled when this flag is “0”, and is enabled when this flag is “1”. This flag is cleared to “0” when the interrupt is acknowledged.

- **Bit 7: Stack pointer select flag (U flag)**
  Interrupt stack pointer (ISP) is selected when this flag is “0” ; user stack pointer (USP) is selected when this flag is “1”.
  This flag is cleared to “0” when a hardware interrupt is acknowledged or an INT instruction of software interrupt Nos. 0 to 31 is executed.
- **Bits 8 to 11: Reserved area**
- **Bits 12 to 14: Processor interrupt priority level (IPL)**
  Processor interrupt priority level (IPL) is configured with three bits, for specification of up to eight processor interrupt priority levels from level 0 to level 7.
  If a requested interrupt has priority greater than the processor interrupt priority level (IPL), the interrupt is enabled.
- **Bit 15: Reserved area**

The C, Z, S, and O flags are changed when instructions are executed. See the software manual for details.

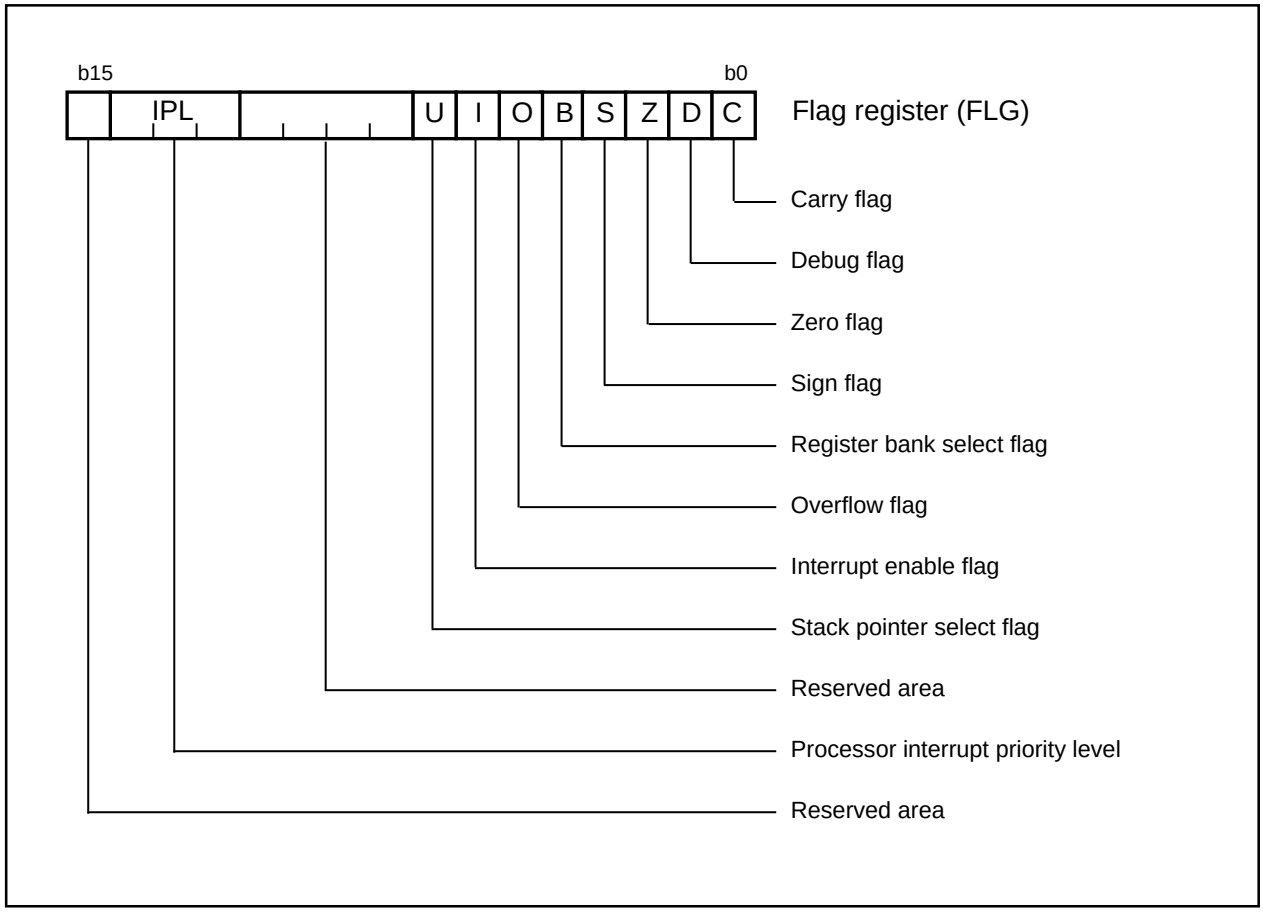

Figure 2.2.2 Flag register (FLG)

2.3 Reset

There are two kinds of resets; hardware and software. In both cases, operation is the same after the reset. (See “Software Reset” for details of software resets.) This section explains on hardware resets.

When the supply voltage is in the range where operation is guaranteed, a reset is effected by holding the reset pin level “L” (0.2Vcc max.) for at least 20 cycles. When the reset pin level is then returned to the “H” level while main clock is stable, the reset status is cancelled and program execution resumes from the address in the reset vector table.

Figure 2.3.1 shows the example reset circuit. Figure 2.3.2 shows the reset sequence.

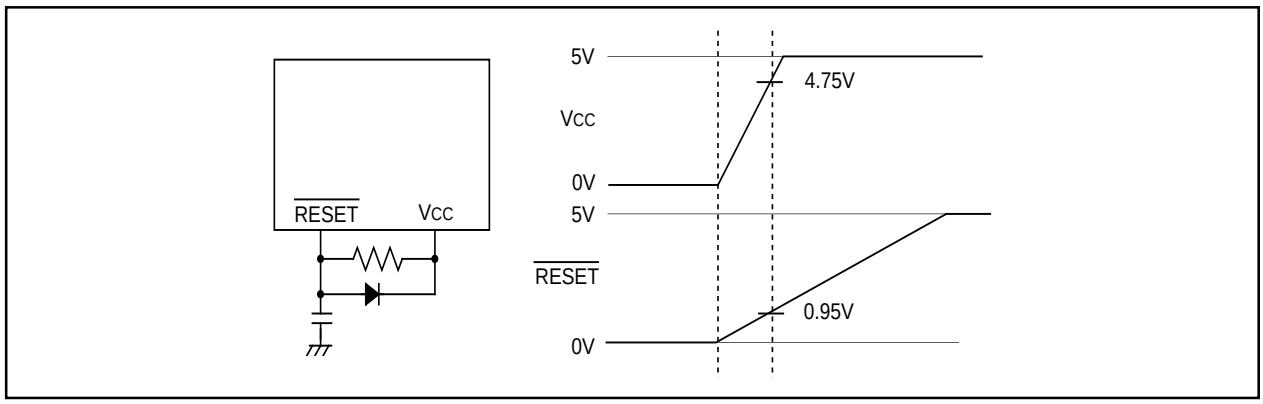

Figure 2.3.1 Example reset circuit

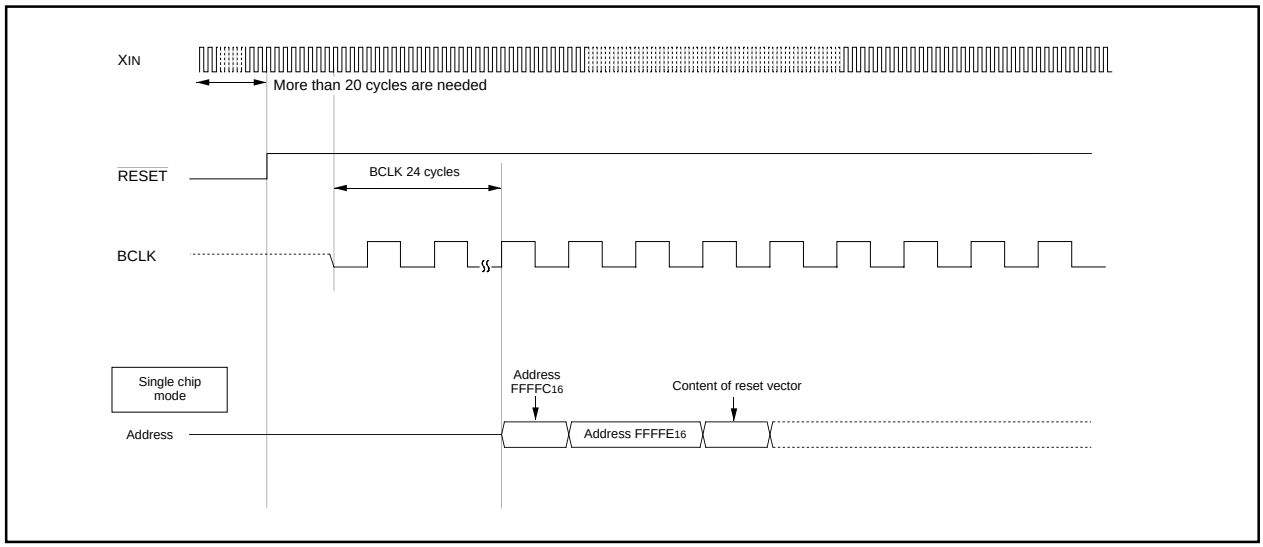

Figure 2.3.2 Reset sequence

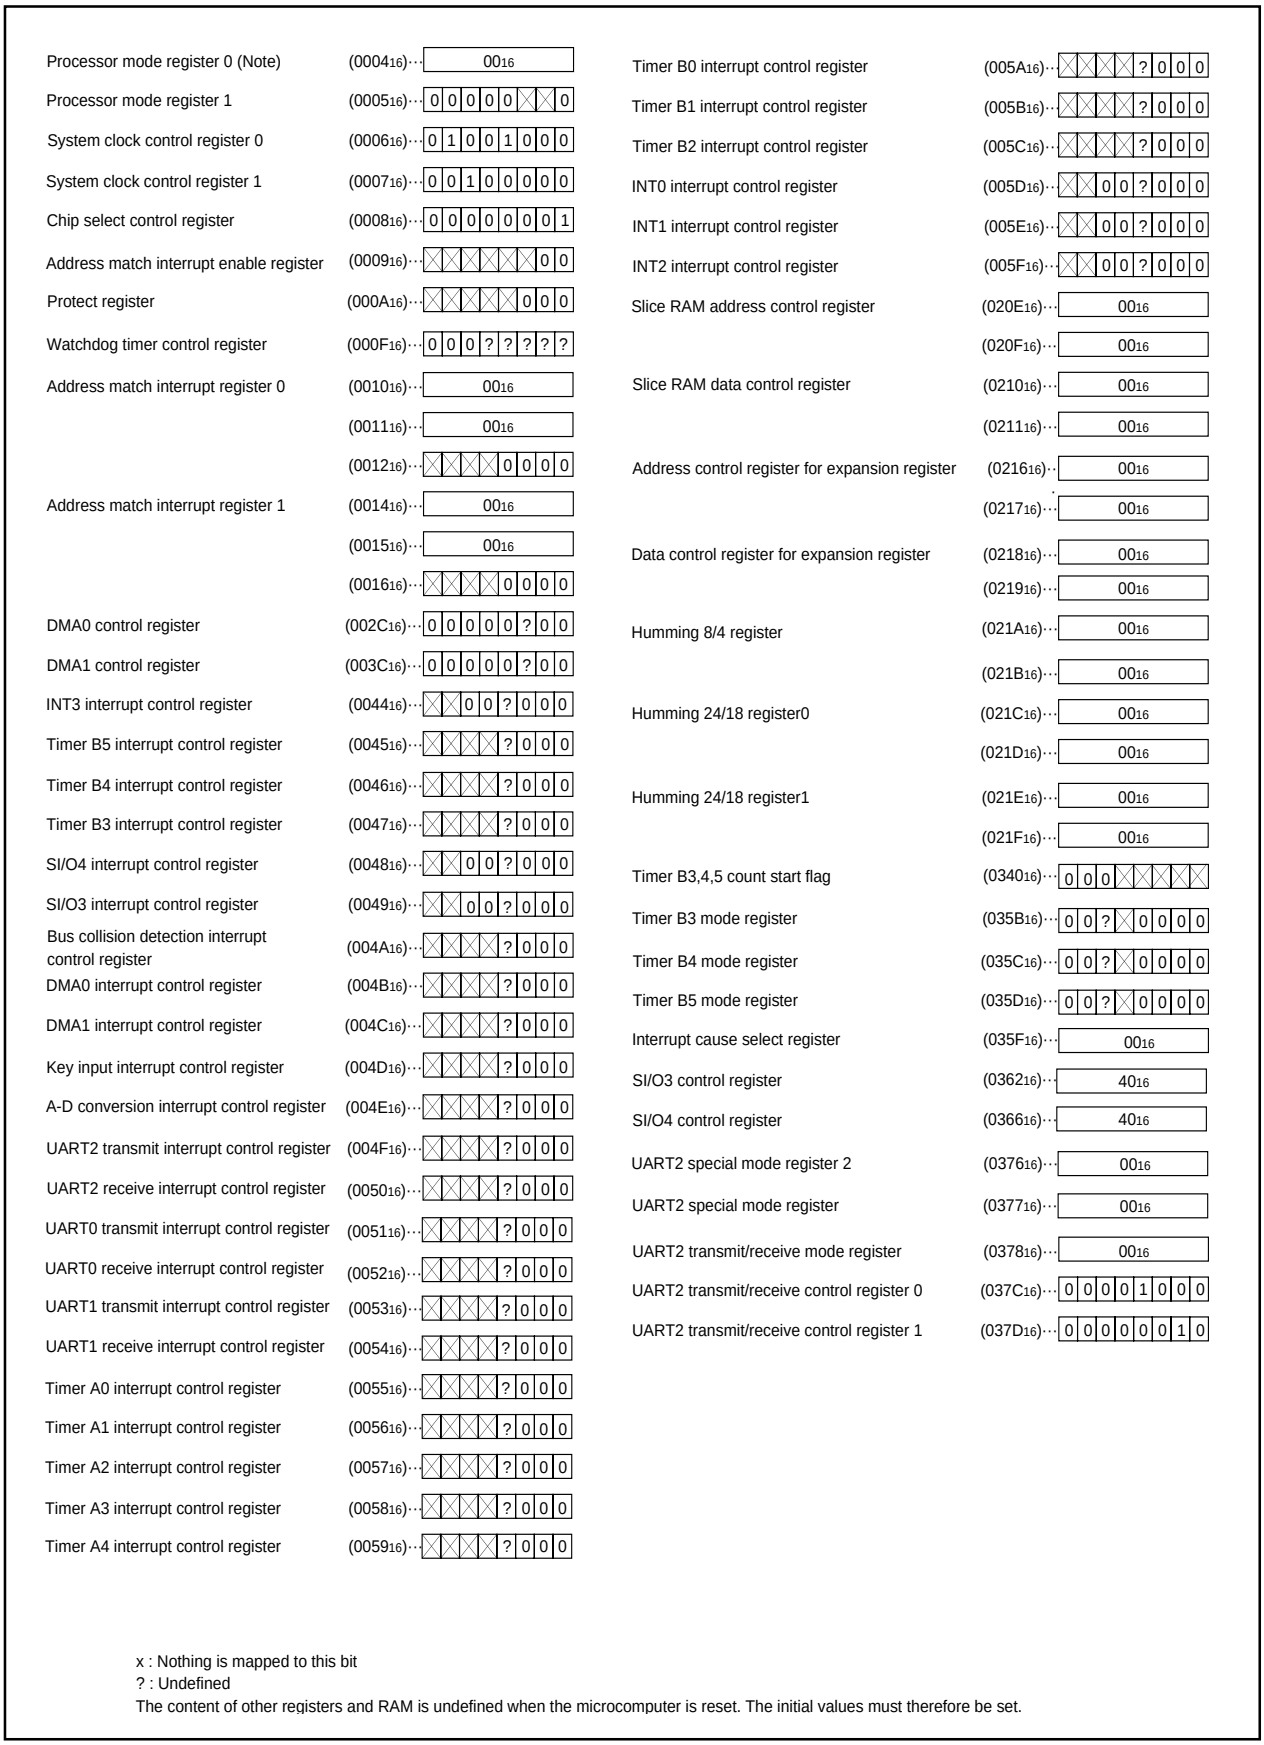
Table 2.3.1 shows the statuses of the other pins while the $\overline{\text{RESET}}$ pin level is “L”. Figures 2.3.3 and 2.3.4 show the internal status of the microcomputer immediately after the reset is cancelled.

Table 2.3.1 Pin status when $\overline{\text{RESET}}$ pin level is “L”

Pin name	Status
P0 to P10	Input port (floating)
P11	Output port
CVIN1,SVREF,SYNCIN,M1,FSCIN	Input port
LP2,LP3,LP4	Output port

2.3.1 Software Reset

Writing “1” to bit 3 of the processor mode register 0 (address 0004_{16}) applies a (software) reset to the microcomputer. A software reset has almost the same effect as a hardware reset. The contents of internal RAM are preserved.



x : Nothing is mapped to this bit
? : Undefined
The content of other registers and RAM is undefined when the microcomputer is reset. The initial values must therefore be set.

x : Nothing is mapped to this bit
? : Undefined

The content of other registers and RAM is undefined when the microcomputer is reset. The initial values must therefore be set.

Note: When the V_{CC} level is applied to the CNV_{SS} pin, it is 02$_{16}$ at a reset.

Figure 2.3.4 Device's internal status after a reset is cleared

2.4 Processor Mode

(1) Types of Processor Mode

Processor mode can be used at microprocessor mode.

One of three processor modes can be selected:single-chip mode and memory expansion mode.The functions of some pins,the memory map,and the access space differ according to the selected processor mode.

• Single-chip mode

In single-chip mode,only internal memory space (SFR,internal RAM,and internal ROM)can be accessed.Ports P0 to P10 can be used as programmable I/O ports or as I/O ports for the internal peripheral functions.

• Memory expansion mode

In memory expansion mode,external memory can be accessed in addition to the internal memory space (SFR,internal RAM,and internal ROM).

In this mode,some of the pins function as the address bus,the data bus,and as control signals.The number of pins assigned to these functions depends on the bus and register settings.(See "Bus Settings " for details..)

(2) Setting Processor Modes

The processor mode is set using the processor mode bits (bits 1 and 0 at address 000416).Do not set the processor mode bits to "10_2 " and "11_2 ".

Changing the processor mode bits selects the mode.Therefore,
never change the processor mode bits when changing the contents of other bits.

• Applying VSS to CNVSS pin

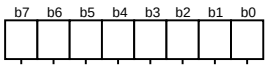
The microcomputer begins operation in single-chip mode after being reset.Memory expansion mode is selected by writing "01_2 " to the processor mode is selected bits..

Figure 2.4.1 shows the processor mode register 0 and 1.

Figure 2.4.2 shows the memory maps applicable for each of the modes when memory area dose not be expanded (normal mode).

Note : Microprocessor mode cannot be used.

Processor mode register 0 (Note 1)

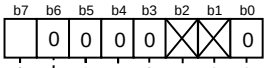


Symbol	Address	When reset
PM0	0004_{16}	00_{16}

Bit symbol	Bit name	Function	R	W
PM00	Processor mode bit	b1 b0 0 0: Single-chip mode 0 1: Memory expansion mode 1 0: Inhibited 1 1: Inhibited	○	○
PM01			○	○
PM02	R/W mode select bit	0 : $\overline{RD}$,$\overline{BHE}$,$\overline{WR}$ 1 : RD,WRH,WRL	○	○
PM03	Software reset bit	The device is reset when this bit is set to “1”. The value of this bit is “0” when read.	○	○
PM04	Multiplexed bus space select bit	b5 b4 0 0 : Multiplexed bus is not used 0 1 : Allocated to CS2 space 1 0 : Allocated to CS1 space 1 1 : Allocated to entire space (Note 3)	○	○
PM05			○	○
PM06	Port $P4_0$ to $P4_3$ function select bit (Note 2)	0 : Address output 1 : Port function (Address is not output)	○	○
PM07	BCLK output disable bit	0 : BCLK is output 1 : BCLK is not output (Pin is left floating)	○	○

Notes 1: Set bit 1 of the protect register (address $000A_{16}$) to “1” when writing new values to this register.
2: Valid in memory expansion mode.
3: If the entire space is of multiplexed bus in memory expansion mode, chose an 8-bit width.
The higher-order address becomes a port if the entire space multiplexed bus is chosen, so only 256 bytes can be in used in each chip select.

Processor mode register 1 (Note)



Symbol	Address	When reset
PM1	0005_{16}	$00000XX0_2$

Bit symbol	Bit name	Function	R	W
Reserved bit		Must always be set to “0”	○	○
Nothing is assigned. In an attempt to write to these bits, write “0”. The value, if read, turns out to be indeterminate.			—	—
Reserved bit		Must always be set to “0”	—	○
Reserved bit		Must always be set to “0”	○	○
PM17	Wait bit	0 : No wait state 1 : Wait state inserted	○	○

Note : Set bit 1 of the protect register (address $000A_{16}$) to “1” when writing new values to this register.

Figure 2.4.1 Processor mode registers

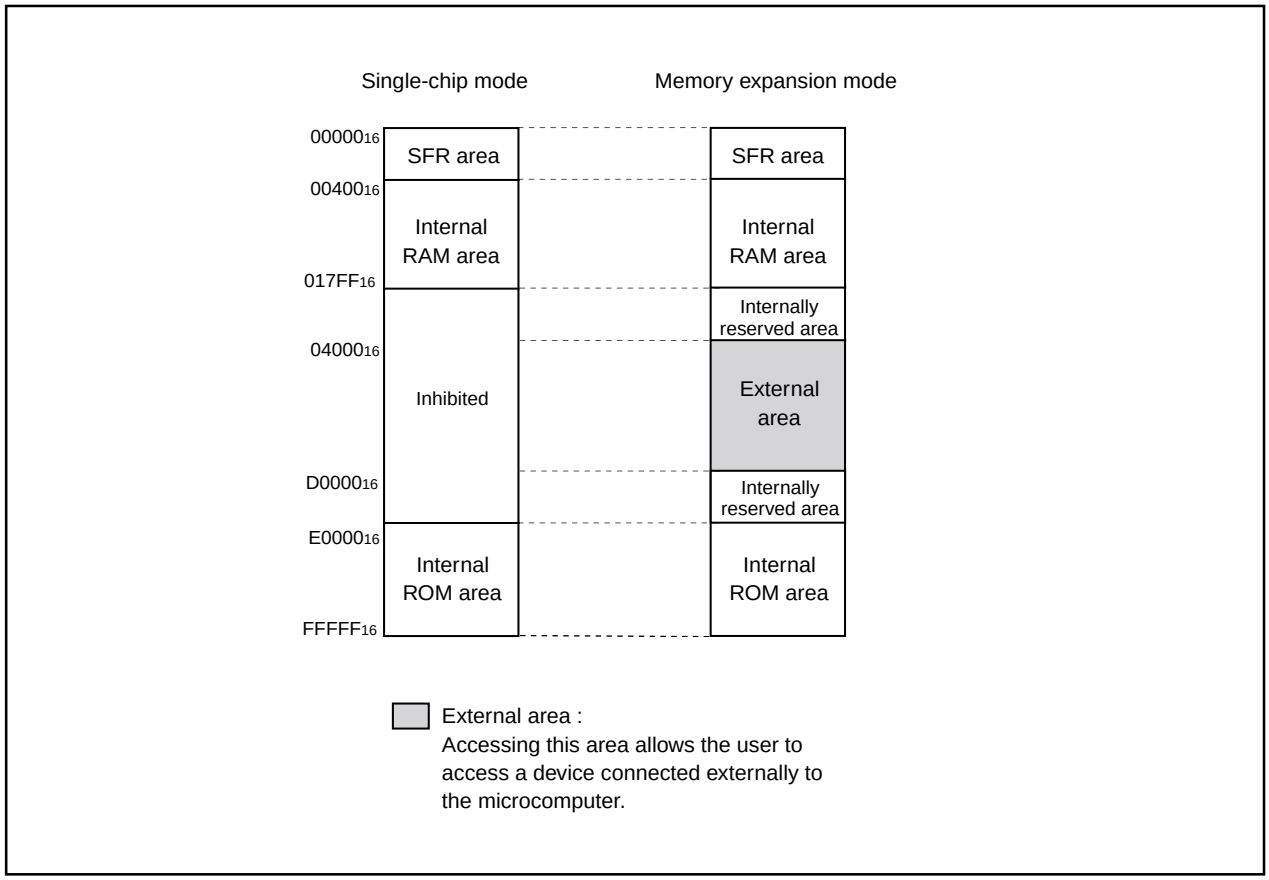


Figure 2.4.2 Memory maps in each processor mode

2.4.1 Bus settings

The BYTE pin and bits 4 to 6 of the processor mode register 0 (address 0004_{16}) are used to change the bus settings.Table 2.4.1 shows the factors used to change the bus settings.

Table 2.4.1 Factors for switching bus settings

Bus setting	Switching factor
Switching external address bus width	Bit 6 of processor mode register 0
Switching external data bus width	BYTE pin
Switching between separate and multiplex bus	Bits 4 and 5 of processor mode register 0

(1) Selecting external address bus width

The address bus width for external output in the 1M bytes of address space can be set to 16 bits (64K bytes address space) or 20 bits (1M bytes address space). When bit 6 of the processor mode register 0 is set to "1", the external address bus width is set to 16 bits, and P2 and P3 become part of the address bus. $P4_0$ to $P4_3$ can be used as programmable I/O ports. When bit 6 of processor mode register 0 is set to "0", the external address bus width is set to 20 bits, and P2, P3, and $P4_0$ to $P4_3$ become part of the address bus.

(2) Selecting external data bus width

The external data bus width can be set to 8 or 16 bits. (Note, however, that only the separate bus can be set.) When the BYTE pin is "L", the bus width is set to 16 bits; when "H", it is set to 8 bits. (The internal bus width is permanently set to 16 bits.) While operating, fix the BYTE pin either to "H" or to "L".

(3) Selecting separate/multiplex bus

The bus format can be set to multiplex or separate bus using bits 4 and 5 of the processor mode register 0.

• Separate bus

In this mode, the data and address are input and output separately. The data bus can be set using the BYTE pin to be 8 or 16 bits. When the BYTE pin is "H", the data bus is set to 8 bits and P0 functions as the data bus and P1 as a programmable I/O port. When the BYTE pin is "L", the data bus is set to 16 bits and P0 and P1 are both used for the data bus.

When the separate bus is used for access, a software wait can be selected.

• Multiplex bus

In this mode, data and address I/O are time multiplexed. With an 8-bit data bus selected (BYTE pin = "H"), the 8 bits from D_0 to D_7 are multiplexed with A_0 to A_7.

With a 16-bit data bus selected (BYTE pin = "L"), the 8 bits from D_0 to D_7 are multiplexed with A_1 to A_8. D_8 to D_{15} are not multiplexed. In this case, the external devices connected to the multiplexed bus are mapped to the microcomputer's even addresses (every 2nd address). To access these external devices, access the even addresses as bytes.

The ALE signal latches the address. It is output from $P5_6$.

Before using the multiplex bus for access, be sure to insert a software wait.

If the entire space is of multiplexed bus in memory expansion mode, choose an 8-bit width.

The higher-order address become a port of the entire space multiplexed bus is chosen, so only 256 bytes can be used in each chip select.

Table 2.4.2 Pin functions for processor mode

Processor mode	Single-chip mode	Memory expansion mode				Memory expansion mode
Multiplexed bus space select bit		"01" Either CS1 or CS2 is for multiplexed bus and others are for separate bus		"00" (separate bus)		"11"(Note 1) Multiplexed bus for the entire space
Data bus width BYTE pin level		8 bits "H"	16 bits "L"	8 bits "H"	16 bits "L"	8 bits "H"
$P0_0$ to $P0_7$	I/O port	Data bus	Data bus	Data bus	Data bus	I/O port
$P1_0$ to $P1_7$	I/O port	I/O port	Data bus	I/O port	Data bus	I/O port
$P2_0$	I/O port	Address bus /data bus (Note)	Address bus	Address bus	Address bus	Address bus /data bus
$P2_1$ to $P2_7$	I/O port /data bus (Note)	Address bus /data bus (Note)	Address bus	Address bus	Address bus /data bus	Address bus
$P3_0$	I/O port /data bus (Note)	Address bus	Address bus	Address bus	Address bus	A_8/D_7
$P3_1$ to $P3_7$	I/O port	Address bus	Address bus	Address bus	Address bus	I/O port
$P4_0$ to $P4_3$ Port $P4_0$ to $P4_3$ function select bit = 1	I/O port	I/O port	I/O port	I/O port	I/O port	I/O port
$P4_0$ to $P4_3$ Port $P4_0$ to $P4_3$ function select bit = 0	I/O port	Address bus	Address bus	Address bus	Address bus	I/O port
$P4_4$ to $P4_7$	I/O port	$\overline{CS}$ (chip select) or programmable I/O port (For details, refer to "Bus control")				
$P5_0$ to $P5_3$	I/O port	Outputs $\overline{RD}$, $\overline{WRL}$, $\overline{WRH}$, and BCLK or $\overline{RD}$, $\overline{BHE}$, $\overline{WR}$, and BCLK (For details, refer to "Bus control")				
$P5_4$	I/O port	$\overline{HLDA}$	$\overline{HLDA}$	$\overline{HLDA}$	$\overline{HLDA}$	$\overline{HLDA}$
$P5_5$	I/O port	$\overline{HOLD}$	$\overline{HOLD}$	$\overline{HOLD}$	$\overline{HOLD}$	$\overline{HOLD}$
$P5_6$	I/O port	ALE	ALE	ALE	ALE	ALE
$P5_7$	I/O port	$\overline{RDY}$	$\overline{RDY}$	$\overline{RDY}$	$\overline{RDY}$	$\overline{RDY}$

Note 1: If the entire space is of multiplexed bus in memory expansion mode, chose an 8-bit width.
The higher-order address becomes a port if the entire space multiplexed bus is chosen, so only 256 bytes can be used in each chip select.
2: Address bus when in separate bus mode.

2.4.2 Bus Control

The following explains the signals required for accessing external devices and software waits.

The signals required for accessing the external devices are valid when the processor mode is set to memory expansion mode and microprocessor mode. The software waits are valid in all processor modes.

(1) Address bus/data bus

The address bus consists of the 20 pins A_0 to A_{19} for accessing the 1M bytes of address space.

The data bus consists of the pins for data I/O. When the BYTE pin is "H", the 8 ports D_0 to D_7 function as the data bus. When BYTE is "L", the 16 ports D_0 to D_{15} function as the data bus.

When a change is made from single-chip mode to memory expansion mode, the value of the address bus is undefined until external memory is accessed.

(2) Chip select signal

The chip select signal is output using the same pins as $P4_4$ to $P4_7$. Bits 0 to 3 of the chip select control register (address 0008_{16}) set each pin to function as a port or to output the chip select signal.

The chip select control register is valid in memory expansion mode. IN single-chip mode, $P4_4$ to $P4_7$ function as programmable I/O ports regardless of the value in the chip select control register.

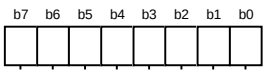
Figure 2.4.3 shows the chip select control register.

The chip select signal can be used to split the external area. Tables 2.4.3 show the external memory areas specified using the chip select signal.

Table 2.4.3 External areas specified by the chip select signals

Processor mode	Chip select signal			
	$\overline{CS0}$	$\overline{CS1}$	$\overline{CS2}$	$\overline{CS3}$
Memory expansion mode	30000_{16} to $CFFFF_{16}$ (640K bytes)	28000_{16} to $2FFFF_{16}$ (32K bytes)	08000_{16} to $27FFF_{16}$ (128K bytes)	04000_{16} to $07FFF_{16}$ (16K bytes)

Chip select control register



Symbol CSR | Address 0008_{16} | When reset 01_{16}

Bit symbol	Bit name	Function	R	W
CS0	$\overline{CS0}$ output enable bit	0 : Chip select output disabled (Normal port pin) 1 : Chip select output enabled	O	O
CS1	$\overline{CS1}$ output enable bit		O	O
CS2	$\overline{CS2}$ output enable bit		O	O
CS3	$\overline{CS3}$ output enable bit		O	O
CS0W	$\overline{CS0}$ wait bit	0 : Wait state inserted 1 : No wait state	O	O
CS2W	$\overline{CS1}$ wait bit		O	O
CS2W	$\overline{CS2}$ wait bit		O	O
CS3W	$\overline{CS3}$ wait bit		O	O

Figure 2.4.3 Chip select control register

(3) Read/write signals

With a 16-bit data bus (BYTE pin ="L"), bit 2 of the processor mode register 0 (address 0004_{16}) select the combinations of $\overline{RD}$, $\overline{BHE}$, and $\overline{WR}$ signals or $\overline{RD}$, $\overline{WRL}$, and $\overline{WRH}$ signals. With an 8-bit data bus (BYTE pin = "H"), use the combination of $\overline{RD}$, $\overline{WR}$, and $\overline{BHE}$ signals. (Set bit 2 of the processor mode register 0 (address 0004_{16}) to "0".) Tables 2.4.4 and 2.4.5 show the operation of these signals.
After a reset has been cancelled, the combination of $\overline{RD}$, $\overline{WR}$, and $\overline{BHE}$ signals is automatically selected. When switching to the $\overline{RD}$, $\overline{WRL}$, and $\overline{WRH}$ combination, do not write to external memory until bit 2 of the processor mode register 0 (address 0004_{16}) has been set (Note).

Note: Before attempting to change the contents of the processor mode register 0, set bit 1 of the protect register (address $000A_{16}$) to "1".

Table 2.4.4 Operation of $\overline{RD}$, $\overline{WRL}$, and $\overline{WRH}$ signals

Data bus width	$\overline{RD}$	$\overline{WRL}$	$\overline{WRH}$	Status of external data bus
16-bit (BYTE = "L")	L	H	H	Read data
	H	L	H	Write 1 byte of data to even address
	H	H	L	Write 1 byte of data to odd address
	H	L	L	Write data to both even and odd addresses

Table 2.4.5 Operation of $\overline{RD}$, $\overline{WR}$, and $\overline{BHE}$ signals

Data bus width	$\overline{RD}$	$\overline{WR}$	$\overline{BHE}$	A0	Status of external data bus
16-bit (BYTE = "L")	H	L	L	H	Write 1 byte of data to odd address
	L	H	L	H	Read 1 byte of data from odd address
	H	L	H	L	Write 1 byte of data to even address
	L	H	H	L	Read 1 byte of data from even address
	H	L	L	L	Write data to both even and odd addresses
	L	H	L	L	Read data from both even and odd addresses
8-bit (BYTE = "H")	H	L	Not used	H / L	Write 1 byte of data
	L	H	Not used	H / L	Read 1 byte of data

(4) ALE signal

The ALE signal latches the address when accessing the multiplex bus space. Latch the address when the ALE signal falls.

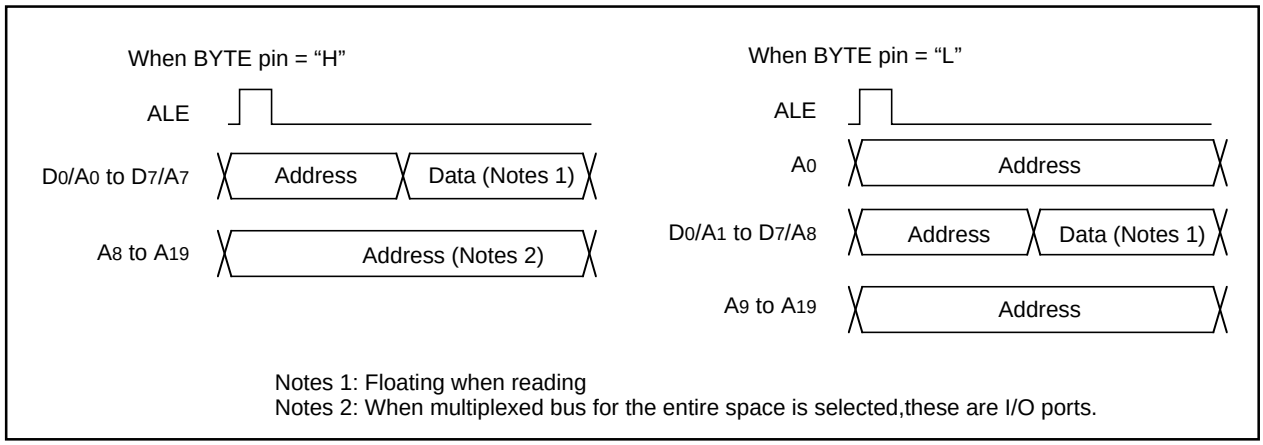


Figure 2.4.4 ALE signal and address/data bus

(5) The $\overline{RDY}$ signal

$\overline{RDY}$ is a signal that facilitates access to an external device that requires long access time. As shown in Figure 2.4.5, if an “L” is being input to the $\overline{RDY}$ at the BCLK falling edge, the bus turns to the wait state. If an “H” is being input to the $\overline{RDY}$ pin at the BCLK falling edge, the bus cancels the wait state. Table 2.4.6 shows the state of the microcomputer with the bus in the wait state, and Figure 2.4.5 shows an example in which the $\overline{RD}$ signal is prolonged by the $\overline{RDY}$ signal.

The $\overline{RDY}$ signal is valid when accessing the external area during the bus cycle in which bits 4 to 7 of the chip select control register (address 0008_{16}) are set to “0”. The $\overline{RDY}$ signal is invalid when setting “1” to all bits 4 to 7 of the chip select control register (address 0008_{16}), but the $\overline{RDY}$ pin should be treated as properly as in non-using.

Table 2.4.6 Microcomputer status in ready state (Note)

Item	Status
Oscillation	On
R/$\overline{W}$ signal, address bus, data bus, $\overline{CS}$ ALE signal, $\overline{HLDA}$, programmable I/O ports	Maintain status when $\overline{RDY}$ signal received
Internal peripheral circuits	On

Note: The $\overline{RDY}$ signal cannot be received immediately prior to a software wait.

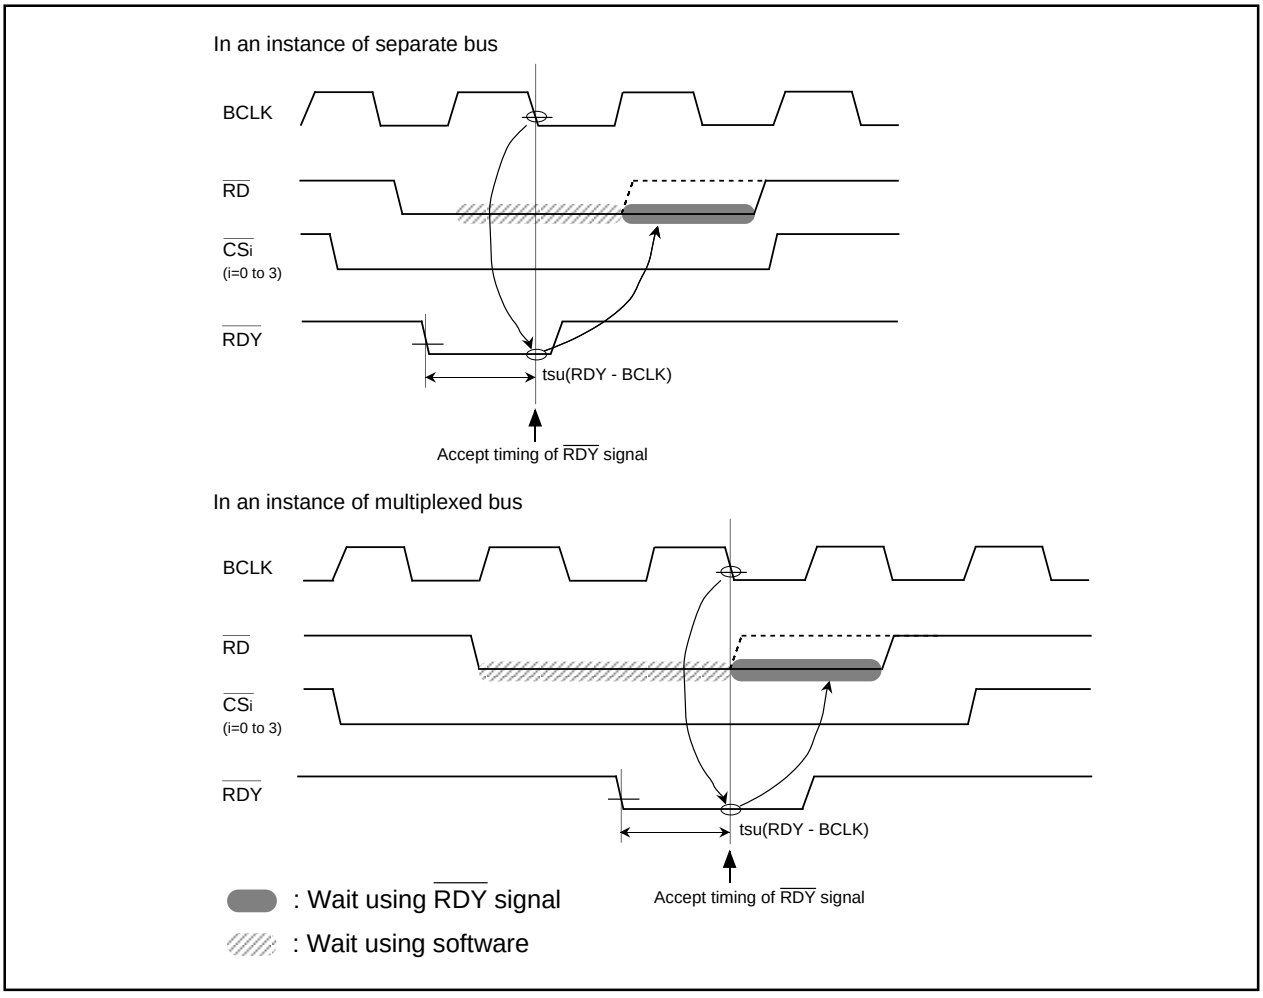

Figure 2.4.5 Example of $\overline{RD}$ signal extended by $\overline{RDY}$ signal

(6) Hold signal

The hold signal is used to transfer the bus privileges from the CPU to the external circuits. Inputting "L" to the $\overline{HOLD}$ pin places the microcomputer in the hold state at the end of the current bus access. This status is maintained and "L" is output from the $\overline{HLDA}$ pin as long as "L" is input to the $\overline{HOLD}$ pin. Table 2.4.7 shows the microcomputer status in the hold state.

Bus-using priorities are given to $\overline{HOLD}$, DMAC, and CPU in order of decreasing precedence.

$\overline{HOLD}$ > DMAC > CPU

Figure 2.4.6 Bus-using priorities

Table 2.4.7 Microcomputer status in hold state

Item		Status
Oscillation		ON
R/$\overline{W}$ signal, address bus, data bus, $\overline{CS}$, $\overline{BHE}$		Floating
Programmable I/O ports	P0, P1, P2, P3, P4, P5	Floating
	P6, P7, P8, P9, P10	Maintains status when hold signal is received
$\overline{HLDA}$		Output "L"
Internal peripheral circuits		ON (but watchdog timer stops)
ALE signal		Undefined

(7) External bus status when the internal area is accessed

Table 2.4.8 shows the external bus status when the internal area is accessed.

Table 2.4.8 External bus status when the internal area is accessed

Item		SFR accessed	Internal RAM accessed
Address bus		Address output	Maintain status before accessed address of external area
Data bus	When read	Floating	Floating
	When write	Output data	Undefined
$\overline{RD}$, $\overline{WR}$, $\overline{WRL}$, $\overline{WRH}$		$\overline{RD}$, $\overline{WR}$, $\overline{WRL}$, $\overline{WRH}$ output	Output "H"
$\overline{BHE}$		$\overline{BHE}$ output	Maintain status before accessed status of external area
$\overline{CS}$		Output "H"	Output "H"
ALE		Output "L"	Output "L"

(8) BCLK output

The user can choose the BCLK output by use of bit 7 of processor mode register 0 (0004_{16}) (Note). When set to “1”, the output floating.

Note: Before attempting to change the contents of the processor mode register 0, set bit 1 of the protectregister (address $000A_{16}$) to “1”.

(9) Software wait

A software wait can be inserted by setting the wait bit (bit 7) of the processor mode register 1 (address 0005_{16}) (Note) and bits 4 to 7 of the chip select control register (address 0008_{16}).

A software wait is inserted in the internal ROM/RAM area and in the external memory area by setting the wait bit of the processor mode register 1. When set to “0”, each bus cycle is executed in one BCLK cycle. When set to “1”, each bus cycle is executed in two or three BCLK cycles. After the microcomputer has been reset, this bit defaults to “0”. When set to “1”, a wait is applied to all memory areas (two or three BCLK cycles), regardless of the contents of bits 4 to 7 of the chip select control register. Set this bit after referring to the recommended operating conditions (main clock input oscillation frequency) of the electric characteristics. However, when the user is using the $\overline{RDY}$ signal, the relevant bit in the chip select control register’s bits 4 to 7 must be set to “0”.

When the wait bit of the processor mode register 1 is “0”, software waits can be set independently for each areas selected using the chip select signal. Bits 4 to 7 of the chip select control register correspond to chip selects $\overline{CS0}$ to $\overline{CS3}$. When one of these bits is set to “1”, the bus cycle is executed in one BCLK cycle. When set to “0”, the bus cycle is executed in two or three BCLK cycles. These bits default to “0” after the microcomputer has been reset.

The SFR area is always accessed in two BCLK cycles regardless of the setting of these control bits. Also, insert a software wait if using the multiplex bus to access the external memory area.

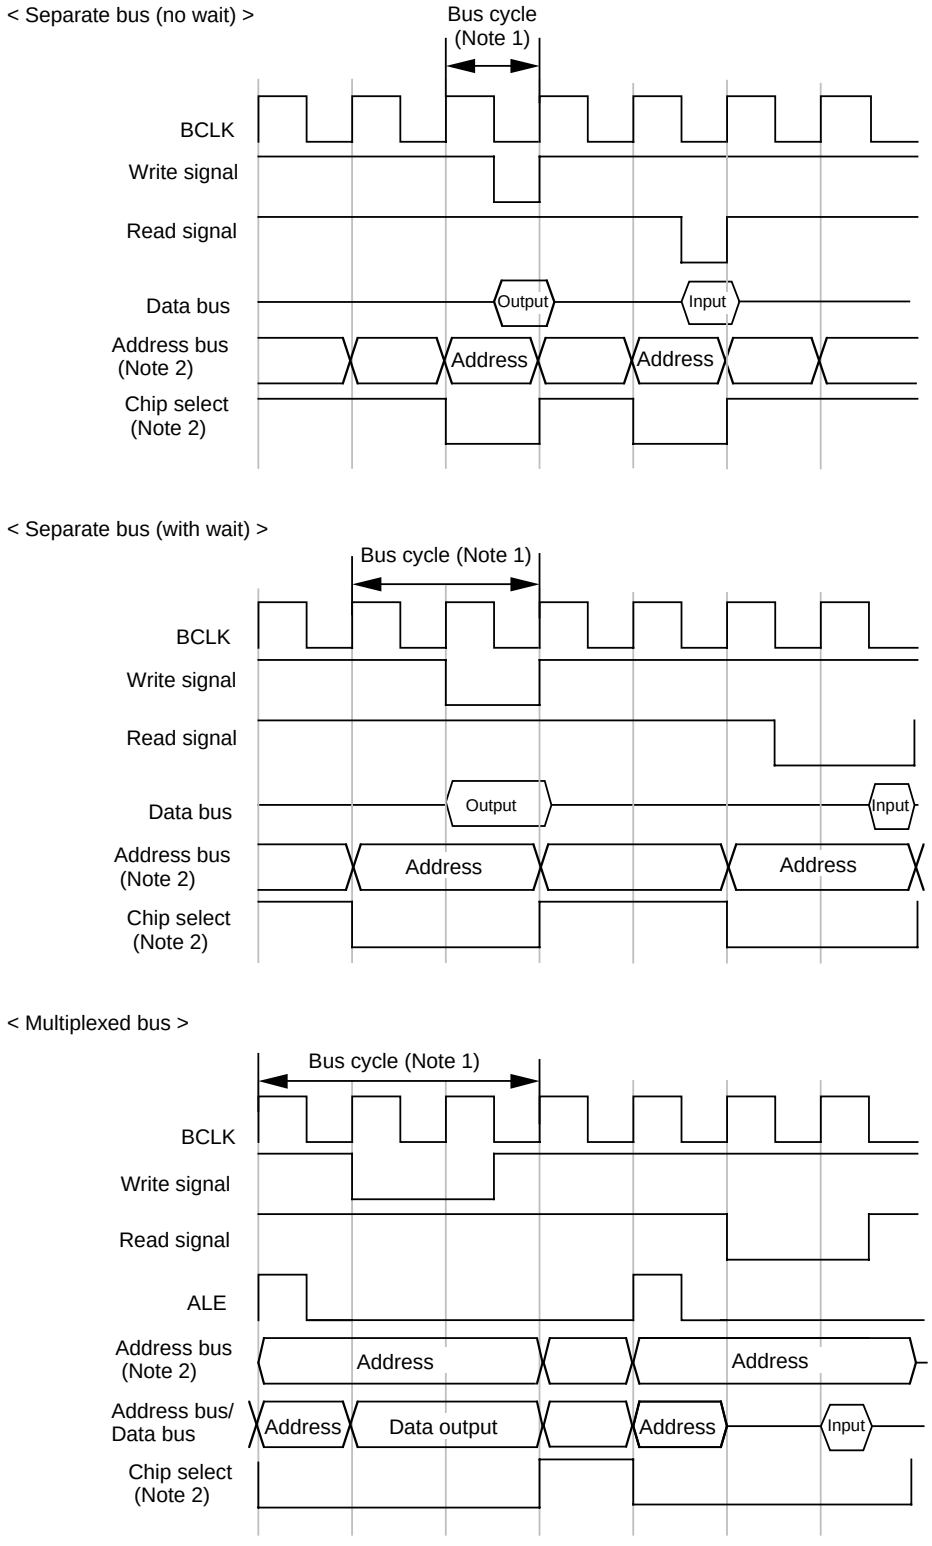
Table 2.4.9 shows the software wait and bus cycles. Figure 2.4.7 shows example bus timing when using software waits.

Note: Before attempting to change the contents of the processor mode register 1, set bit 1 of the protect register (address $000A_{16}$) to “1”.

Table 2.4.9 Software waits and bus cycles

Area	Bus status	Wait bit	Bits 4 to 7 of chip select control register	Bus cycle
SFR	———	Invalid	Invalid	2 BCLK cycles
Internal ROM/RAM	———	0	Invalid	1 BCLK cycle
	———	1	Invalid	2 BCLK cycles
External memory area	Separate bus	0	1	1 BCLK cycle
	Separate bus	0	0	2 BCLK cycles
	Separate bus	1	0 (Note)	2 BCLK cycles
	Multiplex bus	0	0	3 BCLK cycles
	Multiplex bus	1	0 (Note)	3 BCLK cycles

Note: When using the $\overline{RDY}$ signal, always set to “0”.



Note 1: These example timing charts indicate bus cycle length.
After this bus cycle sometimes come read and write cycles in succession.
Note 2: The address bus and chip select may be extended depending on the CPU status such as that of the instruction queue buffer.

Figure 2.4.7 Typical bus timings using software wait

2.5 Clock Generating Circuit

The clock generating circuit contains two oscillator circuits that supply the operating clock sources to the CPU and internal peripheral units.

Table 2.5.1 Main clock and sub clock generating circuits

	Main clock generating circuit	Sub clock generating circuit
Use of clock	• CPU's operating clock source • Internal peripheral units' operating clock source	• CPU's operating clock source • Timer A/B's count clock source
Usable oscillator	Ceramic or crystal oscillator	Crystal oscillator
Pins to connect oscillator	XIN, XOUT	XCIN, XCOUT
Oscillation stop/restart function	Available	Available
Oscillator status immediately after reset	Oscillating	Stopped
Other	Externally derived clock can be input	

2.5.1 Example of oscillator circuit

Figure 2.5.1 shows some examples of the main clock circuit, one using an oscillator connected to the circuit, and the other one using an externally derived clock for input. Figure 2.5.2 shows some examples of sub clock circuits, one using an oscillator connected to the circuit, and the other one using an externally derived clock for input. Circuit constants in Figures 2.5.1 and 2.5.2 vary with each oscillator used. Use the values recommended by the manufacturer of your oscillator.

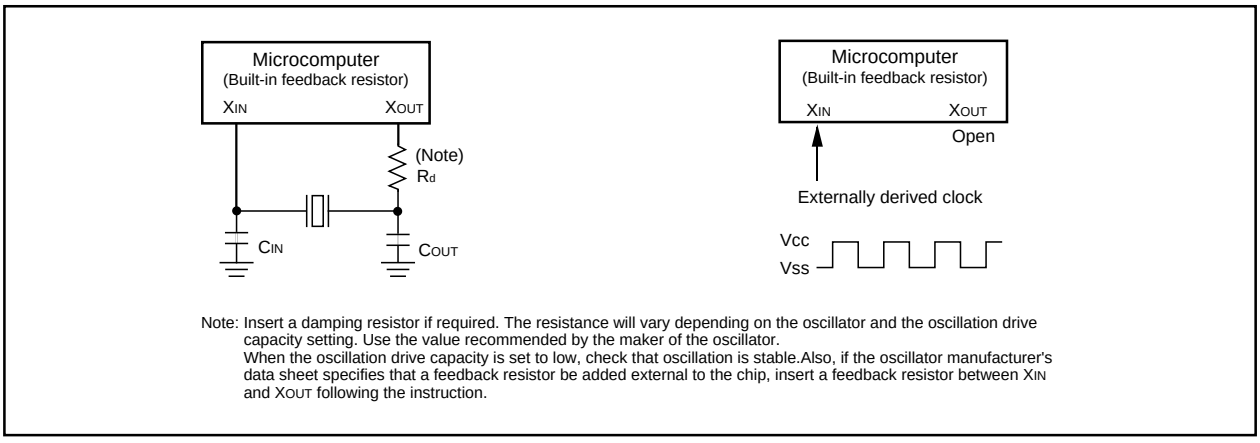


Figure 2.5.1 Examples of main clock

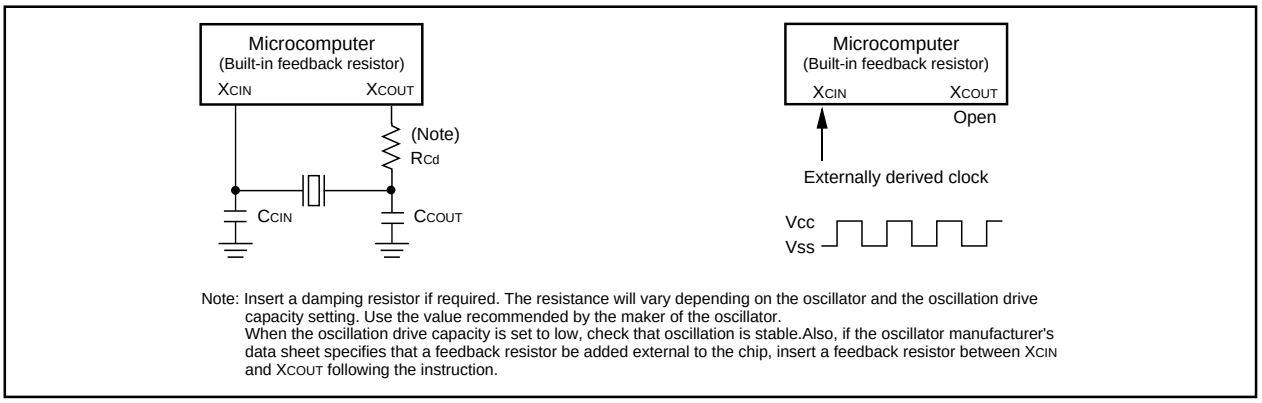

Figure 2.5.2 Examples of sub clock

2.5.2 Clock Control

Figure 2.5.3 shows the block diagram of the clock generating circuit.

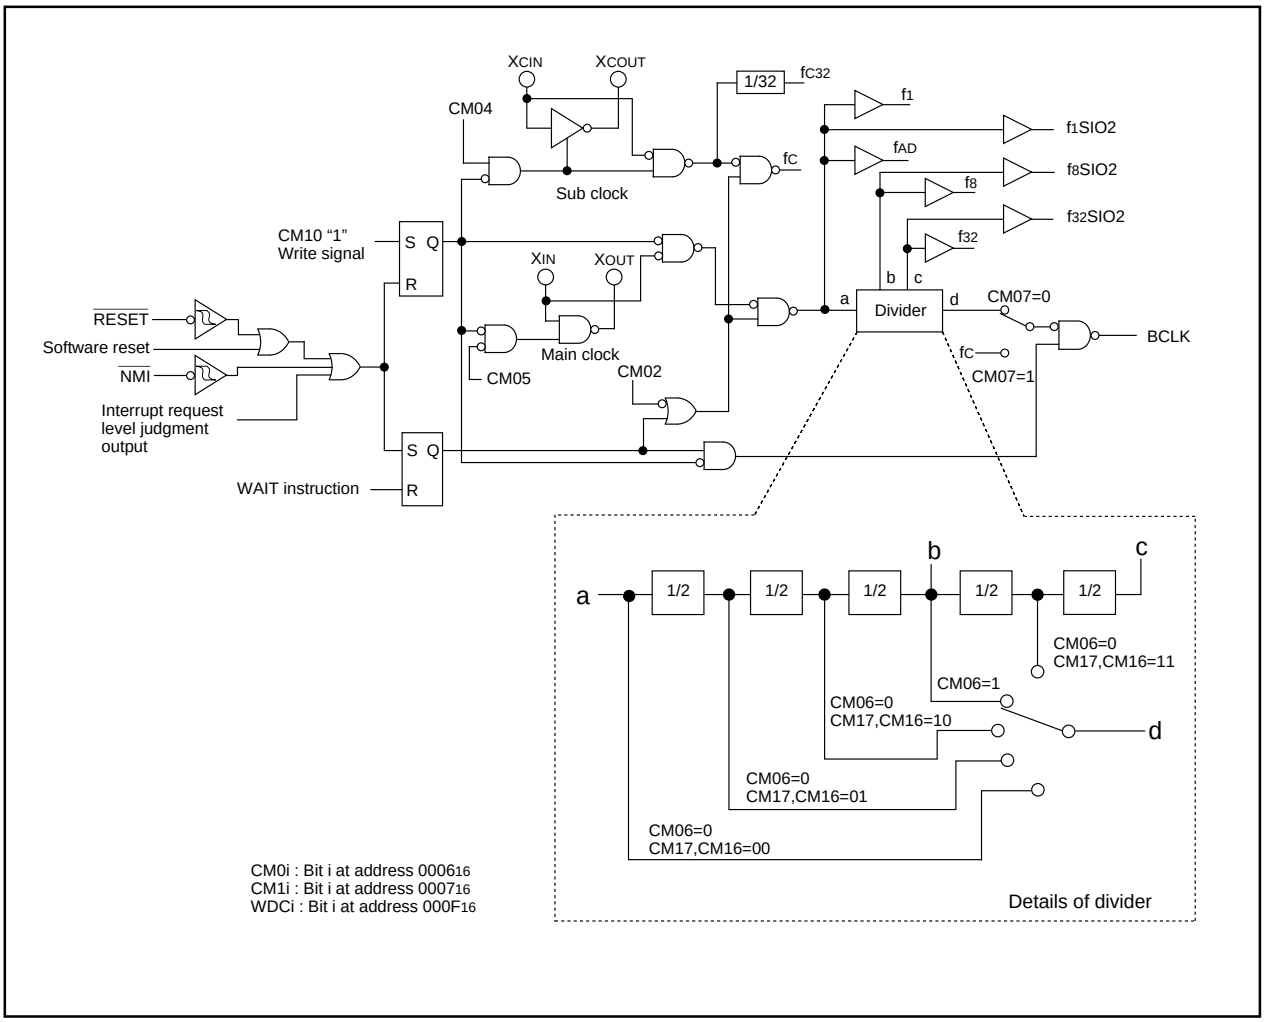

Figure 2.5.3 Clock generating circuit

The following paragraphs describes the clocks generated by the clock generating circuit.

(1) Main clock

The main clock is generated by the main clock oscillation circuit. After a reset, the clock is divided by 8 to the BCLK. The clock can be stopped using the main clock stop bit (bit 5 at address 0006_{16}). Stopping the clock, after switching the operating clock source of CPU to the sub-clock, reduces the power dissipation.After the oscillation of the main clock oscillation circuit has stabilized, the drive capacity of the main clock oscillation circuit can be reduced using the XIN-XOUT drive capacity select bit (bit 5 at address 0007_{16}). Reducing the drive capacity of the main clock oscillation circuit reduces the power dissipation. This bit changes to “1” when shifting from high-speed/medium-speed mode to stop mode and at a reset. When shifting from low-speed/low power dissipation mode to stop mode, the value before stop mode is retained.

(2) Sub-clock

The sub-clock is generated by the sub-clock oscillation circuit. No sub-clock is generated after a reset. After oscillation is started using the port Xc select bit (bit 4 at address 0006_{16}), the sub-clock can be selected as the BCLK by using the system clock select bit (bit 7 at address 0006_{16}). However, be sure that the sub-clock oscillation has fully stabilized before switching.

After the oscillation of the sub-clock oscillation circuit has stabilized, the drive capacity of the sub-clock oscillation circuit can be reduced using the XCIN-XCOUT drive capacity select bit (bit 3 at address 0006_{16}). Reducing the drive capacity of the sub-clock oscillation circuit reduces the power dissipation. This bit changes to “1” when shifting to stop mode and at a reset.

(3) BCLK

The BCLK is the clock that drives the CPU, and is fc or the clock is derived by dividing the main clock by 1, 2, 4, 8, or 16. The BCLK is derived by dividing the main clock by 8 after a reset. The BCLK signal can be output from BCLK pin by the BCLK output disable bit (bit 7 at address 0004_{16}) in the memory expansion and the microprocessor modes.

The main clock division select bit 0(bit 6 at address 0006_{16}) changes to “1” when shifting from high-speed/medium-speed to stop mode and at reset. When shifting from low-speed/low power dissipation mode to stop mode, the value before stop mode is retained.

(4) Peripheral function clock(f_1, f_8, f_{32}, f_{1SIO2}, f_{8SIO2},f_{32SIO2},f_{AD})

The clock for the peripheral devices is derived from the main clock or by dividing it by 1, 8, or 32. The peripheral function clock is stopped by stopping the main clock or by setting the WAIT peripheral function clock stop bit (bit 2 at 0006_{16}) to “1” and then executing a WAIT instruction.

(5) f_{C32}

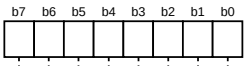
This clock is derived by dividing the sub-clock by 32. It is used for the timer A and timer B counts.

(6) f_C

This clock has the same frequency as the sub-clock. It is used for the BCLK and for the watchdog timer.

Figure 2.5.4 shows the system clock control registers 0 and 1.

System clock control register 0 (Note 1)

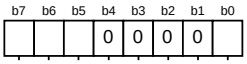


Symbol: CM0 | Address: 000616 | When reset: 4816

Bit symbol	Bit name	Function	R	W
CM00	Clock output function select bit (Valid in single-chip mode only)	b1 b0 0 0 : I/O port P57 0 1 : Output fC 1 0 : Output f8 1 1 : Output f32	O	O
CM01			O	O
CM02	WAIT peripheral function clock stop bit	0 : Do not stop peripheral function clock in wait mode 1 : Stop peripheral function clock in wait mode (Note 8)	O	O
CM03	XCIN-XCOUT drive capacity select bit (Note 2)	0 : LOW 1 : HIGH	O	O
CM04	Port XC select bit	0 : I/O port 1 : XCIN-XCOUT generation	O	O
CM05	Main clock (XIN-XOUT) stop bit (Notes 3,4,5)	0 : On 1 : Off	O	O
CM06	Main clock division select bit 0 (Note 7)	0 : CM16 and CM17 valid 1 : Division by 8 mode	O	O
CM07	System clock select bit (Note 6)	0 : XIN, XOUT 1 : XCIN, XCOUT	O	O

Note 1: Set bit 0 of the protect register (address 000A16) to "1" before writing to this register.
Note 2: Changes to "1" when shifting to stop mode and at a reset.
Note 3: When entering power saving mode, main clock stops using this bit. When returning from stop mode and operating with XIN, set this bit to "0". When main clock oscillation is operating by itself, set system clock select bit (CM07) to "1" before setting this bit to "1".
Note 4: When inputting external clock, only clock oscillation buffer is stopped and clock input is acceptable.
Note 5: If this bit is set to "1", XOUT turns "H". The built-in feedback resistor remains being connected, so XIN turns pulled up to XOUT ("H") via the feedback resistor.
Note 6: Set port Xc select bit (CM04) to "1" and stabilize the sub-clock oscillating before setting to this bit from "0" to "1". Do not write to both bits at the same time. And also, set the main clock stop bit (CM05) to "0" and stabilize the main clock oscillating before setting this bit from "1" to "0".
Note 7: This bit changes to "1" when shifting from high-speed/medium-speed mode to stop mode and at a reset. When shifting from low-speed/low power dissipation mode to stop mode, the value before stop mode is retained.
Note 8: fC32 is not included. Do not set this bit to "1" in the low-speed/ low-power dissipation mode.
Note 9: When the XCIN/XCOUT is used, set ports P86 and P87 as the input ports without pull-up.

System clock control register 1 (Note 1)



Symbol: CM1 | Address: 000716 | When reset: 2016

Bit symbol	Bit name	Function	R	W
CM10	All clock stop control bit (Note4)	0 : Clock on 1 : All clocks off (stop mode)	O	O
Reserved bit		Always set to "0"	O	O
CM15	XIN-XOUT drive capacity select bit (Note 2)	0 : LOW 1 : HIGH	O	O
CM16	Main clock division select bit 1 (Note 3)	b7 b6 0 0 : No division mode 0 1 : Division by 2 mode 1 0 : Division by 4 mode 1 1 : Division by 16 mode	O	O
CM17				

Note 1: Set bit 0 of the protect register (address 000A 16) to "1" before writing to this register.
Note 2: This bit changes to "1" when shifting from high-speed/medium-speed mode to stop mode and at a reset. When shifting from low-speed/low power dissipation mode to stop mode, the value before stop mode is retained.
Note 3: Can be selected when bit 6 of the system clock control register 0 (address 0006 16) is "0". If "1", division mode is fixed at 8.
Note 4: If this bit is set to "1", XOUT turns "H", and the built-in feedback resistor is cut off. XCIN and XCOUT turn high-impedance state.

Figure 2.5.4 Clock control registers 0 and 1

2.5.3 Clock output

In single-chip mode, the clock output function select bits (bits 0 and 1 at address 0006_{16}) enable f_8, f_{32}, or fc to be output from the P57/CLKOUT pin. When the WAIT peripheral function clock stop bit (bit 2 at address 0006_{16}) is set to “1”, the output of f_8 and f_{32} stops when a WAIT instruction is executed.

2.5.4 Stop Mode

Writing “1” to the main clock and sub-clock stop control bit (bit 0 at address 0007_{16}) stops oscillation and the microcomputer enters stop mode. In stop mode, the content of the internal RAM is retained provided that VCC remains above 2V.

The internal oscillator circuit of expansion function (Data acquisition / humming function) stops oscillation when expansion register XTAL_VCO, PDC_VCO_ON, VPS_VCO_ON = "L".

Because the oscillation , BCLK, f_1 to f_{32}, f_{1SIO2} to f_{32SIO2}, fC, f_{C32}, and f_{AD} stops in stop mode, peripheral functions such as the A-D converter and watchdog timer do not function. However, timer A and timer B operate provided that the event counter mode is set to an external pulse, and UARTi(i = 0 to 2) SI/O3,4 functions provided an external clock is selected. Table 2.5.2 shows the status of the ports in stop mode.Stop mode is cancelled by a hardware reset or interrupt. If an interrupt is to be used to cancel stop mode, that interrupt must first have been enabled. If returning by an interrupt, that interrupt routine is executed.When shifting from high-speed/medium-speed mode to stop mode and at a reset, the main clock division select bit 0 (bit 6 at address 0006_{16}) is set to “1”. When shifting from low-speed/ low power dissipation mode to stop mode, the value before stop mode is retained.

Table 2.5.2 Port status during stop mode

Pin		Memory expansion mode	Single-chip mode
Address bus,data bus,$\overline{CS0}$ to $\overline{CS3}$, $\overline{BHE}$		Retains status before wait mode	
$\overline{RD}$,$\overline{WR}$,$\overline{WRL}$,$\overline{WRH}$		“H ”	
$\overline{HLDA}$,BCLK		“H ”	
ALE		“H ”	
Port		Retains status before wait mode	Retains status before wait mode
CLKOUT	When fC selected	Valid only in single-chip mode	“H ”
	When f8,f32 selected	Valid only in single-chip mode	Retains status before wait mode

2.5.5 Wait Mode

When a WAIT instruction is executed, the BCLK stops and the microcomputer enters the wait mode. In this mode, oscillation continues but the BCLK and watchdog timer stop. Writing "1" to the WAIT peripheral function clock stop bit and executing a WAIT instruction stops the clock being supplied to the internal peripheral functions, allowing power dissipation to be reduced. However,peripheral function clock fC32 does not stop so that the peripherals using fC32 do not contribute to the power saving. When the MCU running in low-speed or low power dissipation mode,do not enter WAIT mode with this bit set to "1". Table 2.5.3 shows the status of the ports in wait mode.

Wait mode is cancelled by a hardware reset or an interrupt. When using an interrupt to exit wait mode, make sure the interrupt used for that purpose is enabled and those not used for that purpose have their priority levels set to "0" before entering wait mode. When restored from wait mode by an interrupt, the microcomputer restarts operation from the interrupt routine using as BCLK the clock with which it was operating when the WAIT instruction was executed. When using a hardware reset or $\overline{NMI}$ interrupt only, be sure to set the priority levels of all other interrupts to 0 before entering wait mode.

Table 2.5.3 Port status during wait mode

Pin		Memory expansion mode	Single-chip mode
Address bus, data bus, $\overline{CS0}$ to $\overline{CS3}$ $\overline{BHE}$		Retains status before stop mode	
$\overline{RD}$, $\overline{WR}$, $\overline{WRL}$, $\overline{WRH}$		"H"	
$\overline{HLDA}$, BCLK		"H"	
ALE		"H"	
Port		Retains status before wait mode	Retains status before wait mode
CLK_{OUT}	When fc selected	Valid only in single-chip mode	Does not stop
	When f_8, f_{32} selected	Valid only in single-chip mode	Does not stop when the WAIT peripheral function clock stop bit is "0". When the WAIT peripheral function clock stop bit is "1". the status immediately prior to entering wait mode is maintained.

2.5.6 Status Transition Of BCLK

Power dissipation can be reduced and low-voltage operation achieved by changing the count source for BCLK. Table 2.5.4 shows the operating modes corresponding to the settings of system clock control registers 0 and 1.

When reset, the device starts in division by 8 mode. The main clock division select bit 0 (bit 6 at address 0006_{16}) changes to "1" when shifting from high-speed/medium-speed to stop mode and at a reset. When shifting from low-speed/low power dissipation mode to stop mode, the value before stop mode is retained. The following shows the operational modes of BCLK.

(1) Division by 2 mode

The main clock is divided by 2 to obtain the BCLK.

(2) Division by 4 mode

The main clock is divided by 4 to obtain the BCLK.

(3) Division by 8 mode

The main clock is divided by 8 to obtain the BCLK. When reset, the device starts operating from this mode. Before the user can go from this mode to no division mode, division by 2 mode, or division by 4 mode, the main clock must be oscillating stably. When going to low-speed or lower power dissipation mode, make sure the sub-clock is oscillating stably.

(4) Division by 16 mode

The main clock is divided by 16 to obtain the BCLK.

(5) No-division mode

The main clock is divided by 1 to obtain the BCLK.

(6) Low-speed mode

f_C is used as the BCLK. Note that oscillation of both the main and sub clocks must have stabilized before transferring from this mode to another or vice versa. At least 2 to 3 seconds are required after the sub clock starts. Therefore, the program must be written to wait until this clock has stabilized immediately after powering up and after stop mode is cancelled.

(7) Low power dissipation mode

f_C is the BCLK and the main clock is stopped.

Note :

Before the count source for BCLK can be changed from X_{IN} to X_{CIN} or vice versa, the clock to which the count source is going to be switched must be oscillating stably. Allow a wait time in software for the oscillation to stabilize before switching over the clock.

Table 2.5.4 Operating modes dictated by settings of system clock control registers 0 and 1

CM17	CM16	CM07	CM06	CM05	CM04	Operating mode of BCLK
0	1	0	0	0	Invalid	Division by 2 mode
1	0	0	0	0	Invalid	Division by 4 mode
Invalid	Invalid	0	1	0	Invalid	Division by 8 mode
1	1	0	0	0	Invalid	Division by 16 mode
0	0	0	0	0	Invalid	No-division mode
Invalid	Invalid	1	Invalid	0	1	Low-speed mode
Invalid	Invalid	1	Invalid	1	1	Low power dissipation mode

CM1i: bit i of address 0007_{16}
CM0i: bit i of address 0006_{16}

2.5.7 Power control

The following is a description of the three available power control modes:

Modes

Power control is available in three modes.

(a) Normal operation mode

- **High-speed mode**

  Divide-by-1 frequency of the main clock becomes the BCLK. The CPU operates with the internal clock selected. Each peripheral function operates according to its assigned clock.

- **Medium-speed mode**

  Divide-by-2, divide-by-4, divide-by-8, or divide-by-16 frequency of the main clock becomes the BCLK. The CPU operates according to the internal clock selected. Each peripheral function operates according to its assigned clock.

- **Low-speed mode**

  fC becomes the BCLK. The CPU operates according to the fc clock. The fc clock is supplied by the secondary clock. Each peripheral function operates according to its assigned clock.

- **Low power dissipation mode**

  The main clock operating in low-speed mode is stopped. The CPU operates according to the fC clock. The fc clock is supplied by the secondary clock. The only peripheral functions that operate are those with the sub-clock selected as the count source.

  When in single-chip mode, the device can be operated with a low supply voltage (V_{CC} = 3.0 V) only during low power dissipation mode. Before entering or exiting low power dissipation mode, always make sure the supply voltage V_{CC} is 5 V.

  Note**:** When operating with a low supply voltage, be aware that only the CPU, ROM, RAM, input/output ports, timers (timers A and B), and the interrupt control circuit can be used. All other internal resources (e.g., data slicer, DMAC, A/D, and D/A) cannot be used.

(b) Wait mode

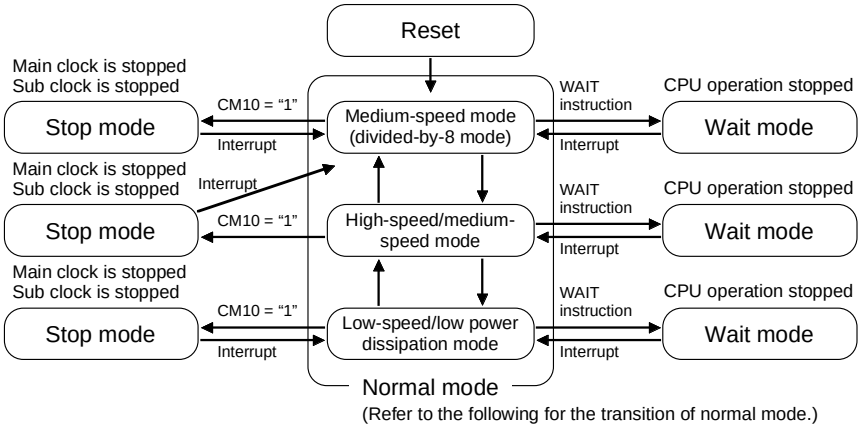
The CPU operation is stopped. The oscillators do not stop.

(c) Stop mode

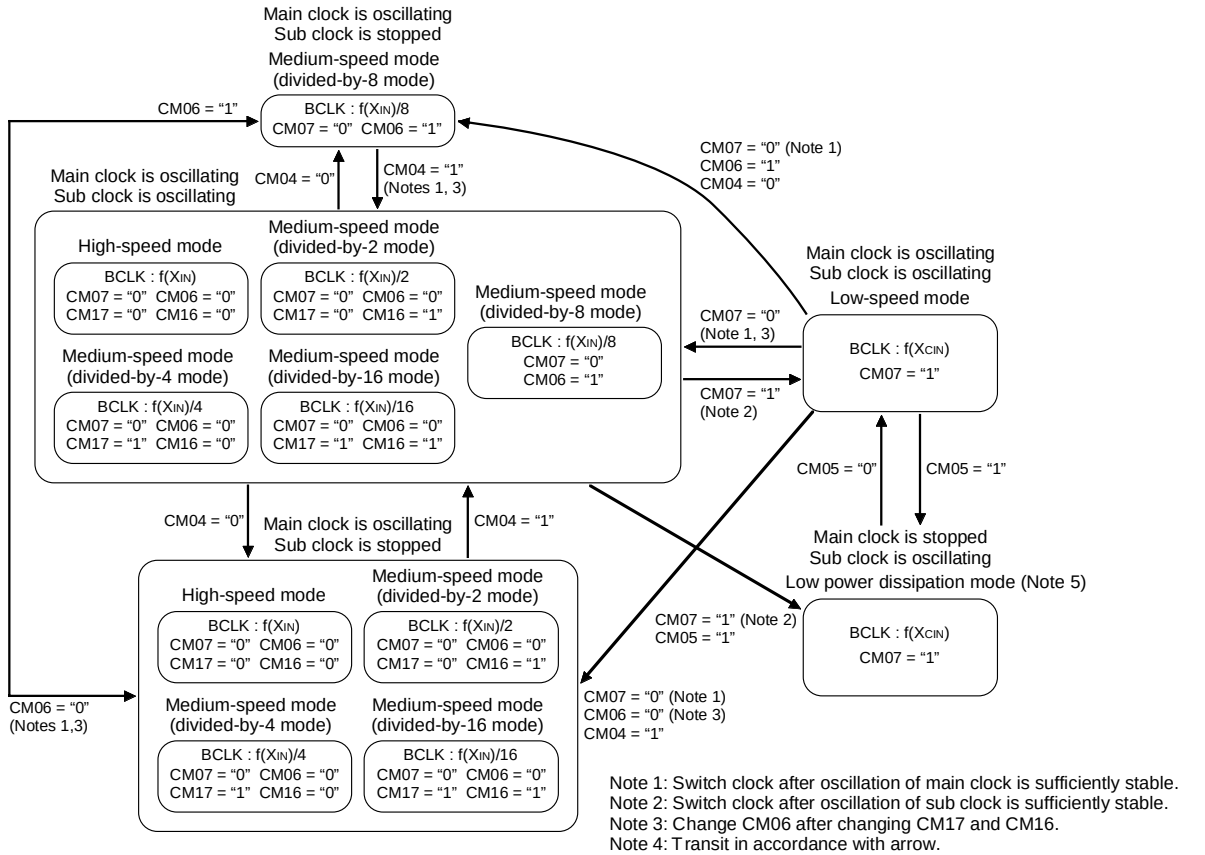
The main clock and the sub-clock oscillators stop. The CPU and all built-in peripheral functions stop. This mode, among the three modes listed here, is the most effective in decreasing power consumption.

Figure 2.5.5 is the state transition diagram of the above modes.

Transition of stop mode, wait mode



Transition of normal mode



Note 1: Switch clock after oscillation of main clock is sufficiently stable.
Note 2: Switch clock after oscillation of sub clock is sufficiently stable.
Note 3: Change CM06 after changing CM17 and CM16.
Note 4: Transit in accordance with arrow.
Note 5: The device can be operated with a low supply voltage (V_{CC} = 3.0 V) in only low power dissipation mode. Always make sure the power supply voltage V_{CC} is switched between 5.0 V and 3.0 V in this mode

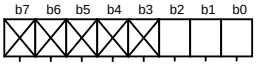
Figure 2.5.5 State transition diagram of Power control mode

2.6 Protection

The protection function is provided so that the values in important registers cannot be changed in the event that the program runs out of control. Figure 2.6.1 shows the protect register. The values in the processor mode register 0 (address 0004_{16}), processor mode register 1 (address 0005_{16}), system clock control register 0 (address 0006_{16}), system clock control register 1 (address 0007_{16}), port P9 direction register (address $03F3_{16}$) , SI/O3 control register (address 0362_{16}) and SI/O4 control register (address 0366_{16}) can only be changed when the respective bit in the protect register is set to “1”. Therefore, important outputs can be allocated to port P9.

If, after “1” (write-enabled) has been written to the port P9 direction register and SI/Oi control register (i=3,4) write-enable bit (bit 2 at address $000A_{16}$), a value is written to any address, the bit automatically reverts to “0” (write-inhibited). However, the system clock control registers 0 and 1 write-enable bit (bit 0 at $000A_{16}$) and processor mode register 0 and 1 write-enable bit (bit 1 at $000A_{16}$) do not automatically return to “0” after a value has been written to an address. The program must therefore be written to return these bits to “0”.

Protect register



Symbol: PRCR — Address: $000A_{16}$ — When reset: $XXXXX000_2$

Bit symbol	Bit name	Function	R	W
PRC0	Enables writing to system clock control registers 0 and 1 (addresses 0006_{16} and 0007_{16})	0 : Write-inhibited 1 : Write-enabled	○	○
PRC1	Enables writing to processor mode registers 0 and 1 (addresses 0004_{16} and 0005_{16})	0 : Write-inhibited 1 : Write-enabled	○	○
PRC2	Enables writing to port P9 direction register (address $03F3_{16}$) and to SI/Oi control register (i=3,4) (addresses 0362_{16} and 0366_{16})(Note)	0 : Write-inhibited 1 : Write-enabled	○	○
Nothing is assigned. In an attempt to write to these bits, write “0”. The value, if read, turns out to be indeterminate.			—	—

Note: Writing a value to an address after “1” is written to this bit returns the bit to “0” . Other bits do not automatically return to “0” and they must therefore be reset by the program.

Figure 2.6.1 Protect register

2.7 Interrupt

2.7.1 Interrupt

Figure 2.7.1 lists the types of interrupts.

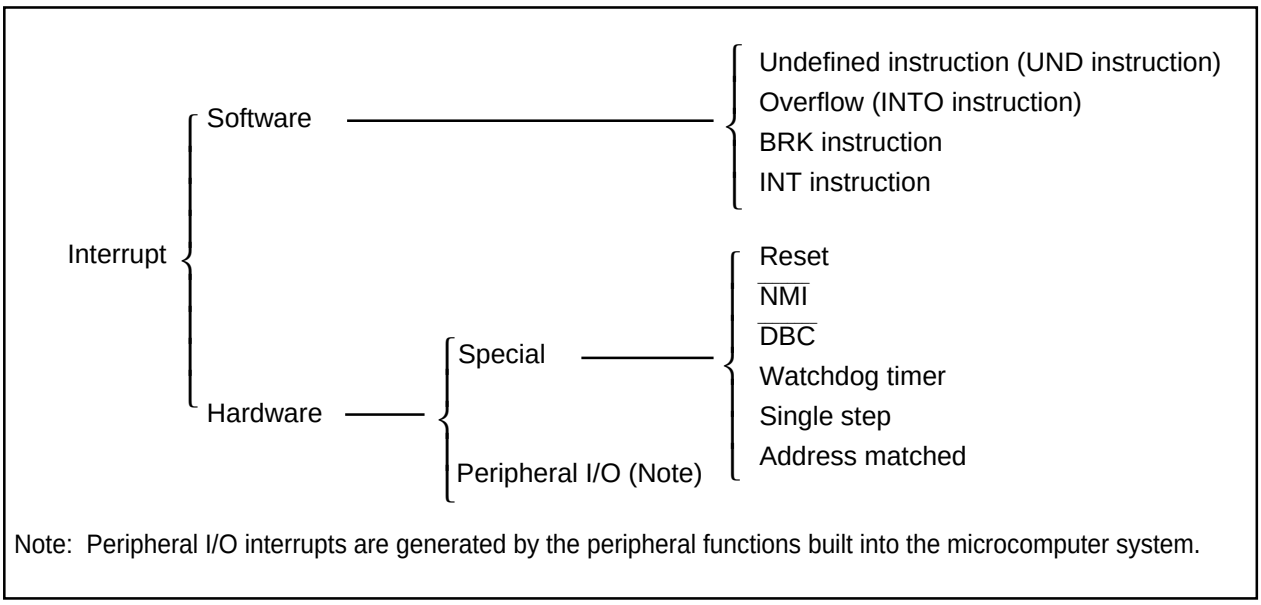


Figure 2.7.1 Classification of interrupts

- Maskable interrupt : An interrupt which can be enabled (disabled) by the interrupt enable flag (I flag) or whose interrupt priority **can be changed** by priority level.
- Non-maskable interrupt : An interrupt which cannot be enabled (disabled) by the interrupt enable flag (I flag) or whose interrupt priority **cannot be changed** by priority level.

2.7.2 Software Interrupts

A software interrupt occurs when executing certain instructions. Software interrupts are non-maskable interrupts.

- **Undefined instruction interrupt**

  An undefined instruction interrupt occurs when executing the UND instruction.
- **Overflow interrupt**

  An overflow interrupt occurs when executing the INTO instruction with the overflow flag (O flag) set to "1". The following are instructions whose O flag changes by arithmetic:

  ABS, ADC, ADCF, ADD, CMP, DIV, DIVU, DIVX, NEG, RMPA, SBB, SHA, SUB
- **BRK interrupt**

  A BRK interrupt occurs when executing the BRK instruction.
- **INT interrupt**

  An INT interrupt occurs when assiging one of software interrupt numbers 0 through 63 and executing the INT instruction. Software interrupt numbers 0 through 31 are assigned to peripheral I/O interrupts, so executing the INT instruction allows executing the same interrupt routine that a peripheral I/O interrupt does.

  The stack pointer (SP) used for the INT interrupt is dependent on which software interrupt number is involved.

  So far as software interrupt numbers 0 through 31 are concerned, the microcomputer saves the stack pointer assignment flag (U flag) when it accepts an interrupt request. If change the U flag to "0" and select the interrupt stack pointer (ISP), and then execute an interrupt sequence. When returning from the interrupt routine, the U flag is returned to the state it was before the acceptance of interrupt request. So far as software numbers 32 through 63 are concerned, the stack pointer does not make a shift.

2.7.3 Hardware Interrupts

Hardware interrupts are classified into two types — special interrupts and peripheral I/O interrupts.

(1) Special interrupts

Special interrupts are non-maskable interrupts.

- **Reset**

  Reset occurs if an “L” is input to the $\overline{\text{RESET}}$ pin.

- **$\overline{\text{NMI}}$ interrupt**

  An $\overline{\text{NMI}}$ interrupt occurs if an “L” is input to the $\overline{\text{NMI}}$ pin.

- **$\overline{\text{DBC}}$ interrupt**

  This interrupt is exclusively for the debugger, do not use it in other circumstances.

- **Watchdog timer interrupt**

  Generated by the watchdog timer.

- **Single-step interrupt**

  This interrupt is exclusively for the debugger, do not use it in other circumstances. With the debug flag (D flag) set to “1”, a single-step interrupt occurs after one instruction is executed.

- **Address match interrupt**

  An address match interrupt occurs immediately before the instruction held in the address indicated by the address match interrupt register is executed with the address match interrupt enable bit set to “1”.

  If an address other than the first address of the instruction in the address match interrupt register is set, no address match interrupt occurs. For address match interrupt, see 2.7.10 Address match Interrupt.

(2) Peripheral I/O interrupts

A peripheral I/O interrupt is generated by one of built-in peripheral functions. Built-in peripheral functions are dependent on classes of products, so the interrupt factors too are dependent on classes of products. The interrupt vector table is the same as the one for software interrupt numbers 0 through 31 the INT instruction uses. Peripheral I/O interrupts are maskable interrupts.

- **Bus collision detection interrupt**

  This is an interrupt that the serial I/O bus collision detection generates.

- **DMA0 interrupt, DMA1 interrupt**

  These are interrupts that DMA generates.

- **Key-input interrupt**

  A key-input interrupt occurs if an “L” is input to the $\overline{\text{KI}}$ pin.

- **A-D conversion interrupt**

  This is an interrupt that the A-D converter generates.

- **UART0, UART1, UART2/NACK, SI/O3 and SI/O4 transmission interrupt**

  These are interrupts that the serial I/O transmission generates.

- **UART0, UART1, UART2/ACK, SI/O3 and SI/O4 reception interrupt**

  These are interrupts that the serial I/O reception generates.

- **Timer A0 interrupt through timer A4 interrupt**

  These are interrupts that timer A generates

- **Timer B0 interrupt through timer B5 interrupt**

  These are interrupts that timer B generates.

- **$\overline{\text{INT0}}$ interrupt through $\overline{\text{INT5}}$ interrupt**

  An $\overline{\text{INT}}$ interrupt occurs if either a rising edge or a falling edge or a both edge is input to the $\overline{\text{INT}}$ pin.

2.7.4 Interrupts and Interrupt Vector Tables

If an interrupt request is accepted, a program branches to the interrupt routine set in the interrupt vector table. Set the first address of the interrupt routine in each vector table. Figure 2.7.2 shows the format for specifying the address.

Two types of interrupt vector tables are available — fixed vector table in which addresses are fixed and variable vector table in which addresses can be varied by the setting.

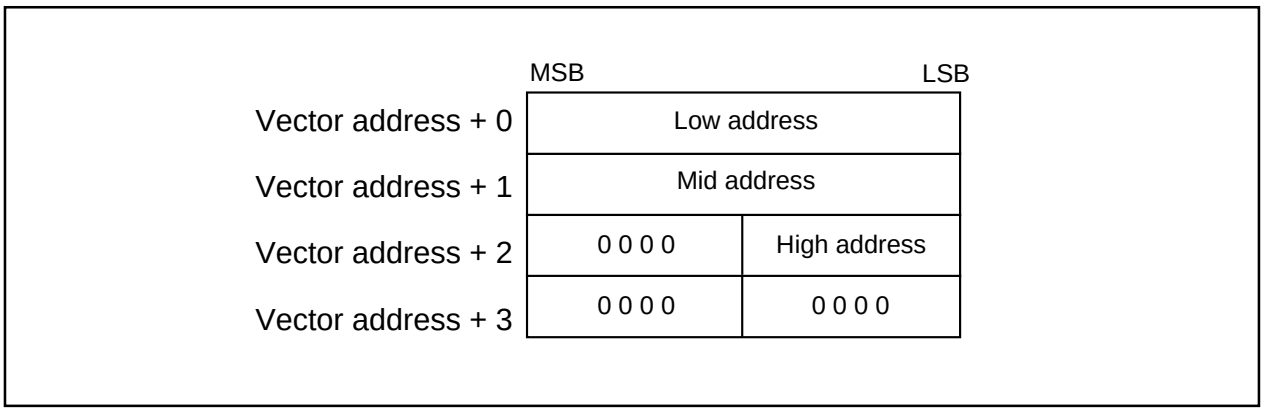

Figure 2.7.2 Format for specifying interrupt vector addresses

• Fixed vector tables

The fixed vector table is a table in which addresses are fixed. The vector tables are located in an area extending from FFFDC16 to FFFFF16. One vector table comprises four bytes. Set the first address of interrupt routine in each vector table. Table 2.7.1 shows the interrupts assigned to the fixed vector tables and addresses of vector tables.

Table 2.7.1 Interrupts assigned to the fixed vector tables and addresses of vector tables

Interrupt source	Vector table addresses Address (L) to address (H)	Remarks
Undefined instruction	FFFDC16 to FFFDF16	Interrupt on UND instruction
Overflow	FFFE016 to FFFE316	Interrupt on INTO instruction
BRK instruction	FFFE416 to FFFE716	If the vector contains FF16, program execution starts from the address shown by the vector in the variable vector table
Address match	FFFE816 to FFFEB16	There is an address-matching interrupt enable bit
Single step (Note)	FFFEC16 to FFFEF16	Do not use
Watchdog timer	FFFF016 to FFFF316	
$\overline{\text{DBC}}$ (Note)	FFFF416 to FFFF716	Do not use
$\overline{\text{NMI}}$	FFFF816 to FFFFB16	External interrupt by input to $\overline{\text{NMI}}$ pin
Reset	FFFFC16 to FFFFF16	

Note: Interrupts used for debugging purposes only.

• Variable vector tables

The addresses in the variable vector table can be modified, according to the user's settings. Indicate the first address using the interrupt table register (INTB). The 256-byte area subsequent to the address the INTB indicates becomes the area for the variable vector tables. One vector table comprises four bytes. Set the first address of the interrupt routine in each vector table. Table 2.7.2 shows the interrupts assigned to the variable vector tables and addresses of vector tables.

Table 2.7.2 Interrupts assigned to the variable vector tables and addresses of vector tables

Software interrupt number	Vector table address Address (L) to address (H)	Interrupt source	Remarks
Software interrupt number 0	+0 to +3 (Note 1)	BRK instruction	Cannot be masked I flag
Software interrupt number 4	+16 to +19 (Note 1)	$\overline{\text{INT3}}$	
Software interrupt number 5	+20 to +23 (Note 1)	Timer B5	
Software interrupt number 6	+24 to +27 (Note 1)	Timer B4	
Software interrupt number 7	+28 to +31 (Note 1)	Timer B3	
Software interrupt number 8	+32 to +35 (Note 1)	SI/O4/$\overline{\text{INT5}}$ (Note 2)	
Software interrupt number 9	+36 to +39 (Note 1)	SI/O3/$\overline{\text{INT4}}$ (Note 2)	
Software interrupt number 10	+40 to +43 (Note 1)	Bus collision detection	
Software interrupt number 11	+44 to +47 (Note 1)	DMA0	
Software interrupt number 12	+48 to +51 (Note 1)	DMA1	
Software interrupt number 13	+52 to +55 (Note 1)	Key input interrupt	
Software interrupt number 14	+56 to +59 (Note 1)	A-D	
Software interrupt number 15	+60 to +63 (Note 1)	UART2 transmit/NACK (Note 3)	
Software interrupt number 16	+64 to +67 (Note 1)	UART2 receive/ACK (Note 3)	
Software interrupt number 17	+68 to +71 (Note 1)	UART0 transmit	
Software interrupt number 18	+72 to +75 (Note 1)	UART0 receive	
Software interrupt number 19	+76 to +79 (Note 1)	UART1 transmit	
Software interrupt number 20	+80 to +83 (Note 1)	UART1 receive	
Software interrupt number 21	+84 to +87 (Note 1)	Timer A0	
Software interrupt number 22	+88 to +91 (Note 1)	Timer A1	
Software interrupt number 23	+92 to +95 (Note 1)	Timer A2	
Software interrupt number 24	+96 to +99 (Note 1)	Timer A3	
Software interrupt number 25	+100 to +103 (Note 1)	Timer A4	
Software interrupt number 26	+104 to +107 (Note 1)	Timer B0	
Software interrupt number 27	+108 to +111 (Note 1)	Timer B1	
Software interrupt number 28	+112 to +115 (Note 1)	Timer B2	
Software interrupt number 29	+116 to +119 (Note 1)	$\overline{\text{INT0}}$	
Software interrupt number 30	+120 to +123 (Note 1)	$\overline{\text{INT1}}$	
Software interrupt number 31	+124 to +127 (Note 1)	$\overline{\text{INT2}}$	
Software interrupt number 32 to Software interrupt number 63	+128 to +131 (Note 1) to +252 to +255 (Note 1)	Software interrupt	Cannot be masked I flag

Note 1: Address relative to address in interrupt table register (INTB).
Note 2: It is selected by interrupt request cause bit (bit 6, 7 in address 035F$_{16}$).
Note 3: When IIC mode is selected, NACK and ACK interrupts are selected.

2.7.5 Interrupt Control

Descriptions are given here regarding how to enable or disable maskable interrupts and how to set the priority to be accepted. What is described here does not apply to non-maskable interrupts.

Enable or disable a maskable interrupt using the interrupt enable flag (I flag), interrupt priority level selection bit, or processor interrupt priority level (IPL). Whether an interrupt request is present or absent is indicated by the interrupt request bit. The interrupt request bit and the interrupt priority level selection bit are located in the interrupt control register of each interrupt. Also, the interrupt enable flag (I flag) and the IPL are located in the flag register (FLG).

Figure 2.7.3 shows the memory map of the interrupt control registers.

Interrupt control register

Symbol	Address	When reset
TBiIC(i=3 to 5)	0045_{16} to 0047_{16}	$XXXXX000_2$
BCNIC	$004A_{16}$	$XXXXX000_2$
DMiIC(i=0, 1)	$004B_{16}$, $004C_{16}$	$XXXXX000_2$

Reserved bit		Always set to “0”	○	○
Nothing is assigned. In an attempt to write to these bits, write “0”. The value, if read, turns out to be “0”.			–	–

Note 1: This bit can only be accessed for reset (= 0), but cannot be accessed for set (= 1).
Note 2: To rewrite the interrupt control register, do so at a point that dose not generate the interrupt request for that register. For details, see the precautions for interrupts.

Figure 2.7.3 Interrupt control registers

(1) Interrupt Enable Flag (I flag)

The interrupt enable flag (I flag) controls the enabling and disabling of maskable interrupts. Setting this flag to “1” enables all maskable interrupts; setting it to “0” disables all maskable interrupts. This flag is set to “0” after reset.

(2) Interrupt Request Bit

The interrupt request bit is set to "1" by hardware when an interrupt is requested. After the interrupt is accepted and jumps to the corresponding interrupt vector, the request bit is set to "0" by hardware. The interrupt request bit can also be set to "0" by software. (Do not set this bit to "1").

(3) Interrupt Priority Level Select Bit and Processor Interrupt Priority Level (IPL)

Set the interrupt priority level using the interrupt priority level select bit, which is one of the component bits of the interrupt control register. When an interrupt request occurs, the interrupt priority level is compared with the IPL. The interrupt is enabled only when the priority level of the interrupt is higher than the IPL. Therefore, setting the interrupt priority level to “0” disables the interrupt.
Table 2.7.3 shows the settings of interrupt priority levels and Table 2.7.4 shows the interrupt levels enabled, according to the consist of the IPL.

The following are conditions under which an interrupt is accepted:
· interrupt enable flag (I flag) = 1
· interrupt request bit = 1
· interrupt priority level > IPL

The interrupt enable flag (I flag), the interrupt request bit, the interrupt priority select bit, and the IPL are independent, and they are not affected by one another.

Table 2.7.3 Settings of interrupt priority levels

Interrupt priority level select bit (b2 b1 b0)	Interrupt priority level	Priority order
0 0 0	Level 0 (interrupt disabled)	———
0 0 1	Level 1	Low ↓
0 1 0	Level 2	
0 1 1	Level 3	
1 0 0	Level 4	
1 0 1	Level 5	
1 1 0	Level 6	
1 1 1	Level 7	High

Table 2.7.4 Interrupt levels enabled according to the contents of the IPL

IPL (IPL_2 IPL_1 IPL_0)	Enabled interrupt priority levels
0 0 0	Interrupt levels 1 and above are enabled
0 0 1	Interrupt levels 2 and above are enabled
0 1 0	Interrupt levels 3 and above are enabled
0 1 1	Interrupt levels 4 and above are enabled
1 0 0	Interrupt levels 5 and above are enabled
1 0 1	Interrupt levels 6 and above are enabled
1 1 0	Interrupt levels 7 and above are enabled
1 1 1	All maskable interrupts are disabled

(4) Rewrite the interrupt control register

To rewrite the interrupt control register, do so at a point that does not generate the interrupt request for that register. If there is possibility of the interrupt request occur, rewrite the interrupt control register after the interrupt is disabled. The program examples are described as follow:

Example 1:

```
INT_SWITCH1:
    FCLR    I              ; Disable interrupts.
    AND.B   #00h, 0055h    ; Clear TA0IC int. priority level and int. request bit.
    NOP                    ; Four NOP instructions are required when using HOLD function.
    NOP
    FSET    I              ; Enable interrupts.
```

Example 2:

```
INT_SWITCH2:
    FCLR    I              ; Disable interrupts.
    AND.B   #00h, 0055h    ; Clear TA0IC int. priority level and int. request bit.
    MOV.W   MEM, R0        ; Dummy read.
    FSET    I              ; Enable interrupts.
```

Example 3:

```
INT_SWITCH3:
    PUSHC   FLG            ; Push Flag register onto stack
    FCLR    I              ; Disable interrupts.
    AND.B   #00h, 0055h    ; Clear TA0IC int. priority level and int. request bit.
    POPC    FLG            ; Enable interrupts.
```

The reason why two NOP instructions (four when using the HOLD function) or dummy read are inserted before FSET I in Examples 1 and 2 is to prevent the interrupt enable flag I from being set before the interrupt control register is rewritten due to effects of the instruction queue.

When a instruction to rewrite the interrupt control register is executed but the interrupt is disabled, the interrupt request bit is not set sometimes even if the interrupt request for that register has been generated. This will depend on the instruction. If this creates problems, use the below instructions to change the register.

Instructions : AND, OR, BCLR, BSET

2.7.6 Interrupt Sequence

An interrupt sequence — what are performed over a period from the instant an interrupt is accepted to the instant the interrupt routine is executed — is described here.

If an interrupt occurs during execution of an instruction, the processor determines its priority when the execution of the instruction is completed, and transfers control to the interrupt sequence from the next cycle. If an interrupt occurs during execution of either the SMOVB, SMOVF, SSTR or RMPA instruction, the processor temporarily suspends the instruction being executed, and transfers control to the interrupt sequence.

In the interrupt sequence, the processor carries out the following in sequence given:

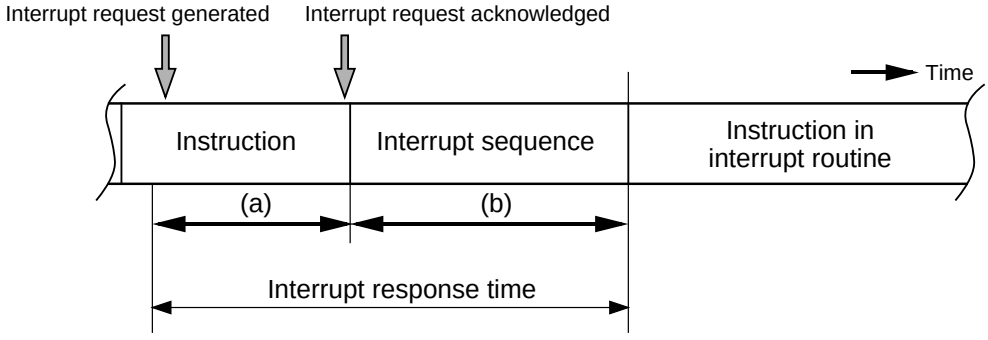
(a) CPU gets the interrupt information (the interrupt number and interrupt request level) by reading address 0000_{16}.
(b) Saves the content of the flag register (FLG) as it was immediately before the start of interrupt sequence in the temporary register (Note) within the CPU.
(c) Sets the interrupt enable flag (I flag), the debug flag (D flag), and the stack pointer select flag (U flag) to “0” (the U flag, however does not change if the INT instruction, in software interrupt numbers 32 through 63, is executed)
(d) Saves the content of the temporary register (Note) within the CPU in the stack area.
(e) Saves the content of the program counter (PC) in the stack area.
(f) Sets the interrupt priority level of the accepted instruction in the IPL.

After the interrupt sequence is completed, the processor resumes executing instructions from the first address of the interrupt routine.

Note: This register cannot be utilized by the user.

(1) Interrupt Response Time

'Interrupt response time' is the period between the instant an interrupt occurs and the instant the first instruction within the interrupt routine has been executed. This time comprises the period from the occurrence of an interrupt to the completion of the instruction under execution at that moment (a) and the time required for executing the interrupt sequence (b). Figure 2.7.4 shows the interrupt response time.



(a) Time from interrupt request is generated to when the instruction then under execution is completed.
(b) Time in which the instruction sequence is executed.

Figure 2.7.4 Interrupt response time

Time (a) is dependent on the instruction under execution. Thirty cycles is the maximum required for the DIVX instruction (without wait).
Time (b) is as shown in Table 2.7.5

Table 2.7.5 Time required for executing the interrupt sequence

Interrupt vector address	Stack pointer (SP) value	16-Bit bus, without wait	8-Bit bus, without wait
Even	Even	18 cycles (Note 1)	20 cycles (Note 1)
Even	Odd	19 cycles (Note 1)	20 cycles (Note 1)
Odd (Note 2)	Even	19 cycles (Note 1)	20 cycles (Note 1)
Odd (Note 2)	Odd	20 cycles (Note 1)	20 cycles (Note 1)

Notes 1: Add 2 cycles in the case of a $\overline{DBC}$ interrupt; add 1 cycle in the case either of an address coincidence interrupt or of a single-step interrupt.
Notes 2: Locate an interrupt vector address in an even address, if possible.

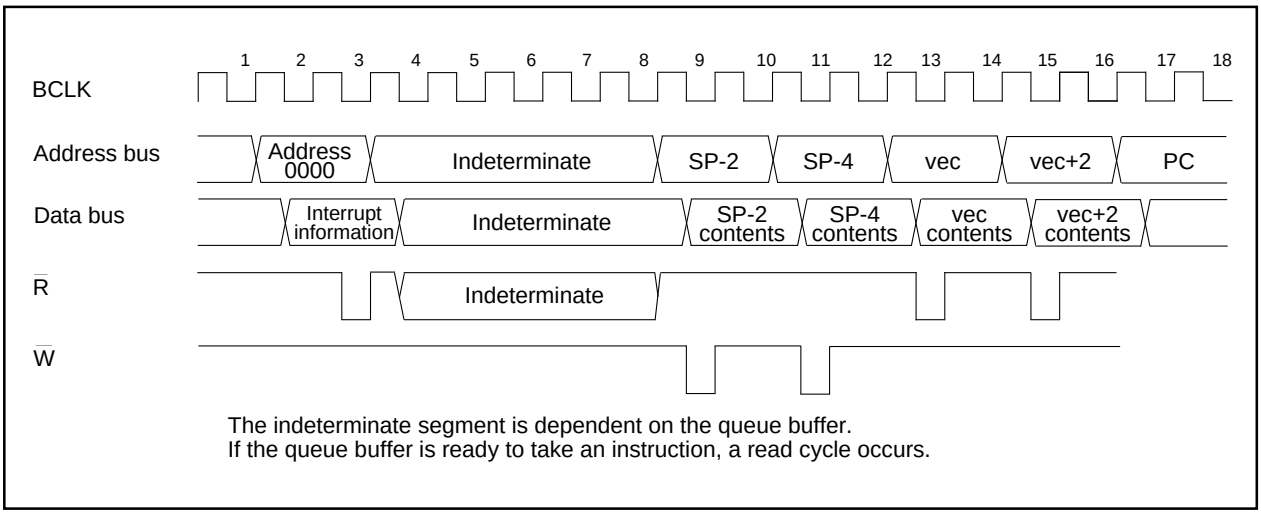


Figure 2.7.5 Time required for executing the interrupt sequence

(2) Variation of IPL when Interrupt Request is Accepted

If an interrupt request is accepted, the interrupt priority level of the accepted interrupt is set in the IPL. If an interrupt request, that does not have an interrupt priority level, is accepted, one of the values shown in Table 2.7.6 is set in the IPL.

Table 2.7.6 Relationship between interrupts without interrupt priority levels and IPL

Interrupt sources without priority levels	Value set in the IPL
Watchdog timer, $\overline{NMI}$	7
Reset	0
Other	Not changed

(3) Saving Registers

In the interrupt sequence, only the contents of the flag register (FLG) and that of the program counter (PC) are saved in the stack area.

First, the processor saves the four higher-order bits of the program counter, and 4 upper-order bits and 8 lower-order bits of the FLG register, 16 bits in total, in the stack area, then saves 16 lower-order bits of the program counter. Figure 2.7.6 shows the state of the stack as it was before the acceptance of the interrupt request, and the state the stack after the acceptance of the interrupt request.

Save other necessary registers at the beginning of the interrupt routine using software. Using the PUSHM instruction alone can save all the registers except the stack pointer (SP).

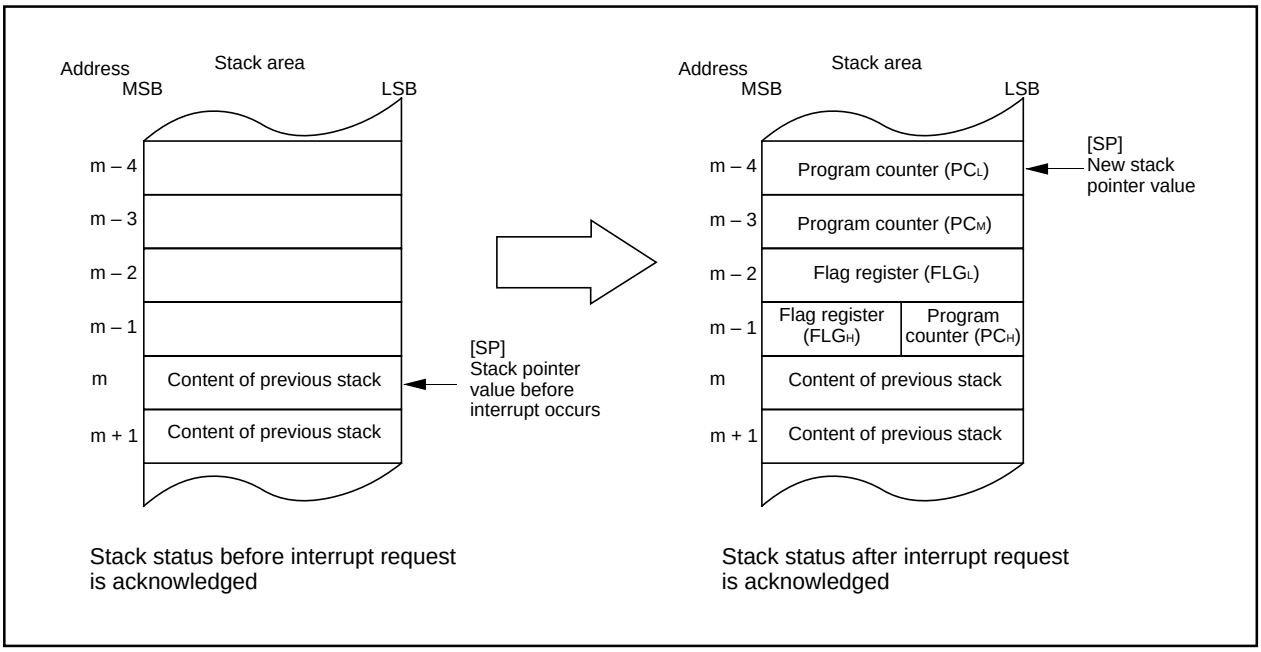

Figure 2.7.6 State of stack before and after acceptance of interrupt request

The operation of saving registers carried out in the interrupt sequence is dependent on whether the content of the stack pointer, at the time of acceptance of an interrupt request, is even or odd. If the content of the stack pointer (Note) is even, the content of the flag register (FLG) and the content of the program counter (PC) are saved, 16 bits at a time. If odd, their contents are saved in two steps, 8 bits at a time. Figure 2.7.7 shows the operation of the saving registers.

Note: When any INT instruction in software numbers 32 to 63 has been executed, this is the stack pointer indicated by the U flag. Otherwise, it is the interrupt stack pointer (ISP).

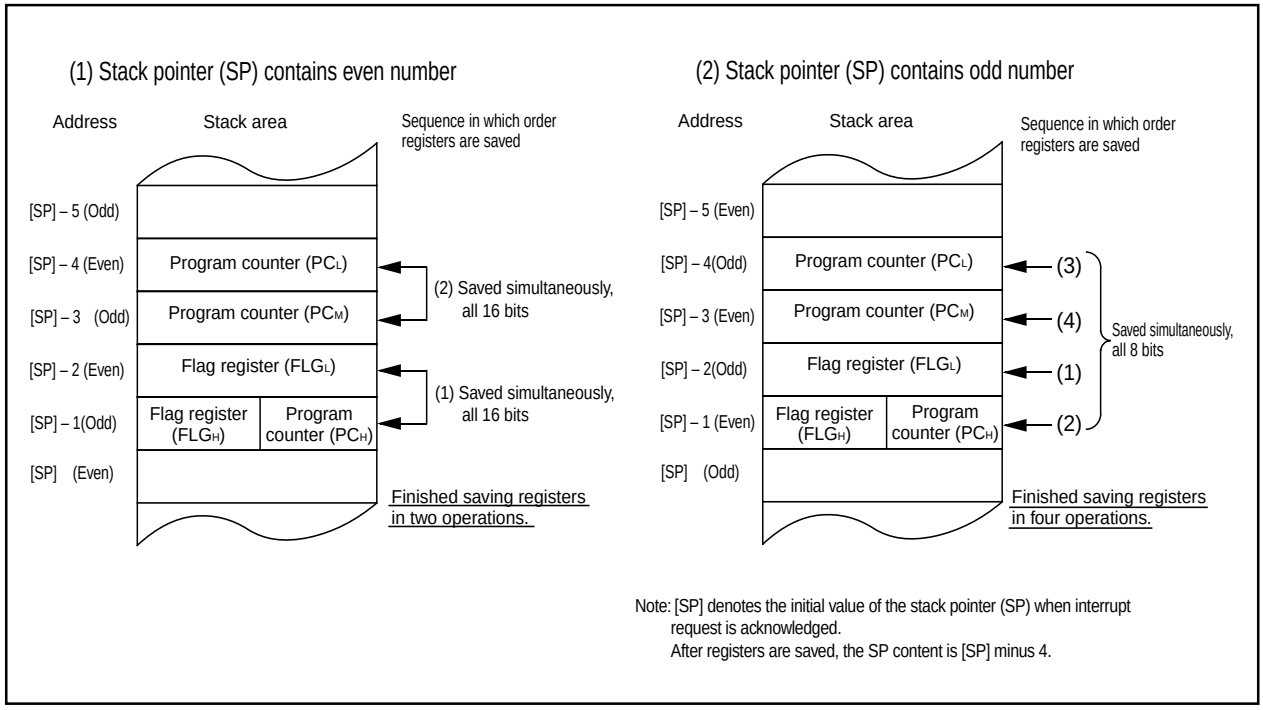

Figure 2.7.7 Operation of saving registers

(4) Returning from an Interrupt Routine

Executing the REIT instruction at the end of an interrupt routine returns the contents of the flag register (FLG) as it was immediately before the start of interrupt sequence and the contents of the program counter (PC), both of which have been saved in the stack area. Then control returns to the program that was being executed before the acceptance of the interrupt request, so that the suspended process resumes.

Return the other registers saved by software within the interrupt routine using the POPM or similar instruction before executing the REIT instruction.

(5) Interrupt Priority

If there are two or more interrupt requests occurring at a point in time within a single sampling (checking whether interrupt requests are made), the interrupt assigned a higher priority is accepted.

Assign an arbitrary priority to maskable interrupts (peripheral I/O interrupts) using the interrupt priority level select bit. If the same interrupt priority level is assigned, however, the interrupt assigned a higher hardware priority is accepted.

Priorities of the special interrupts, such as Reset (dealt with as an interrupt assigned the highest priority), watchdog timer interrupt, etc. are regulated by hardware.

Figure 2.7.8 shows the priorities of hardware interrupts.

Software interrupts are not affected by the interrupt priority. If an instruction is executed, control branches invariably to the interrupt routine.

Reset > $\overline{\text{NMI}}$ > $\overline{\text{DBC}}$ > Watchdog timer > Peripheral I/O > Single step > Address match

Figure 2.7.8 Hardware interrupts priorities

(6) Interrupt resolution circuit

When two or more interrupts are generated simultaneously, this circuit selects the interrupt with the highest priority level. Figure 2.7.9 shows the circuit that judges the interrupt priority level.

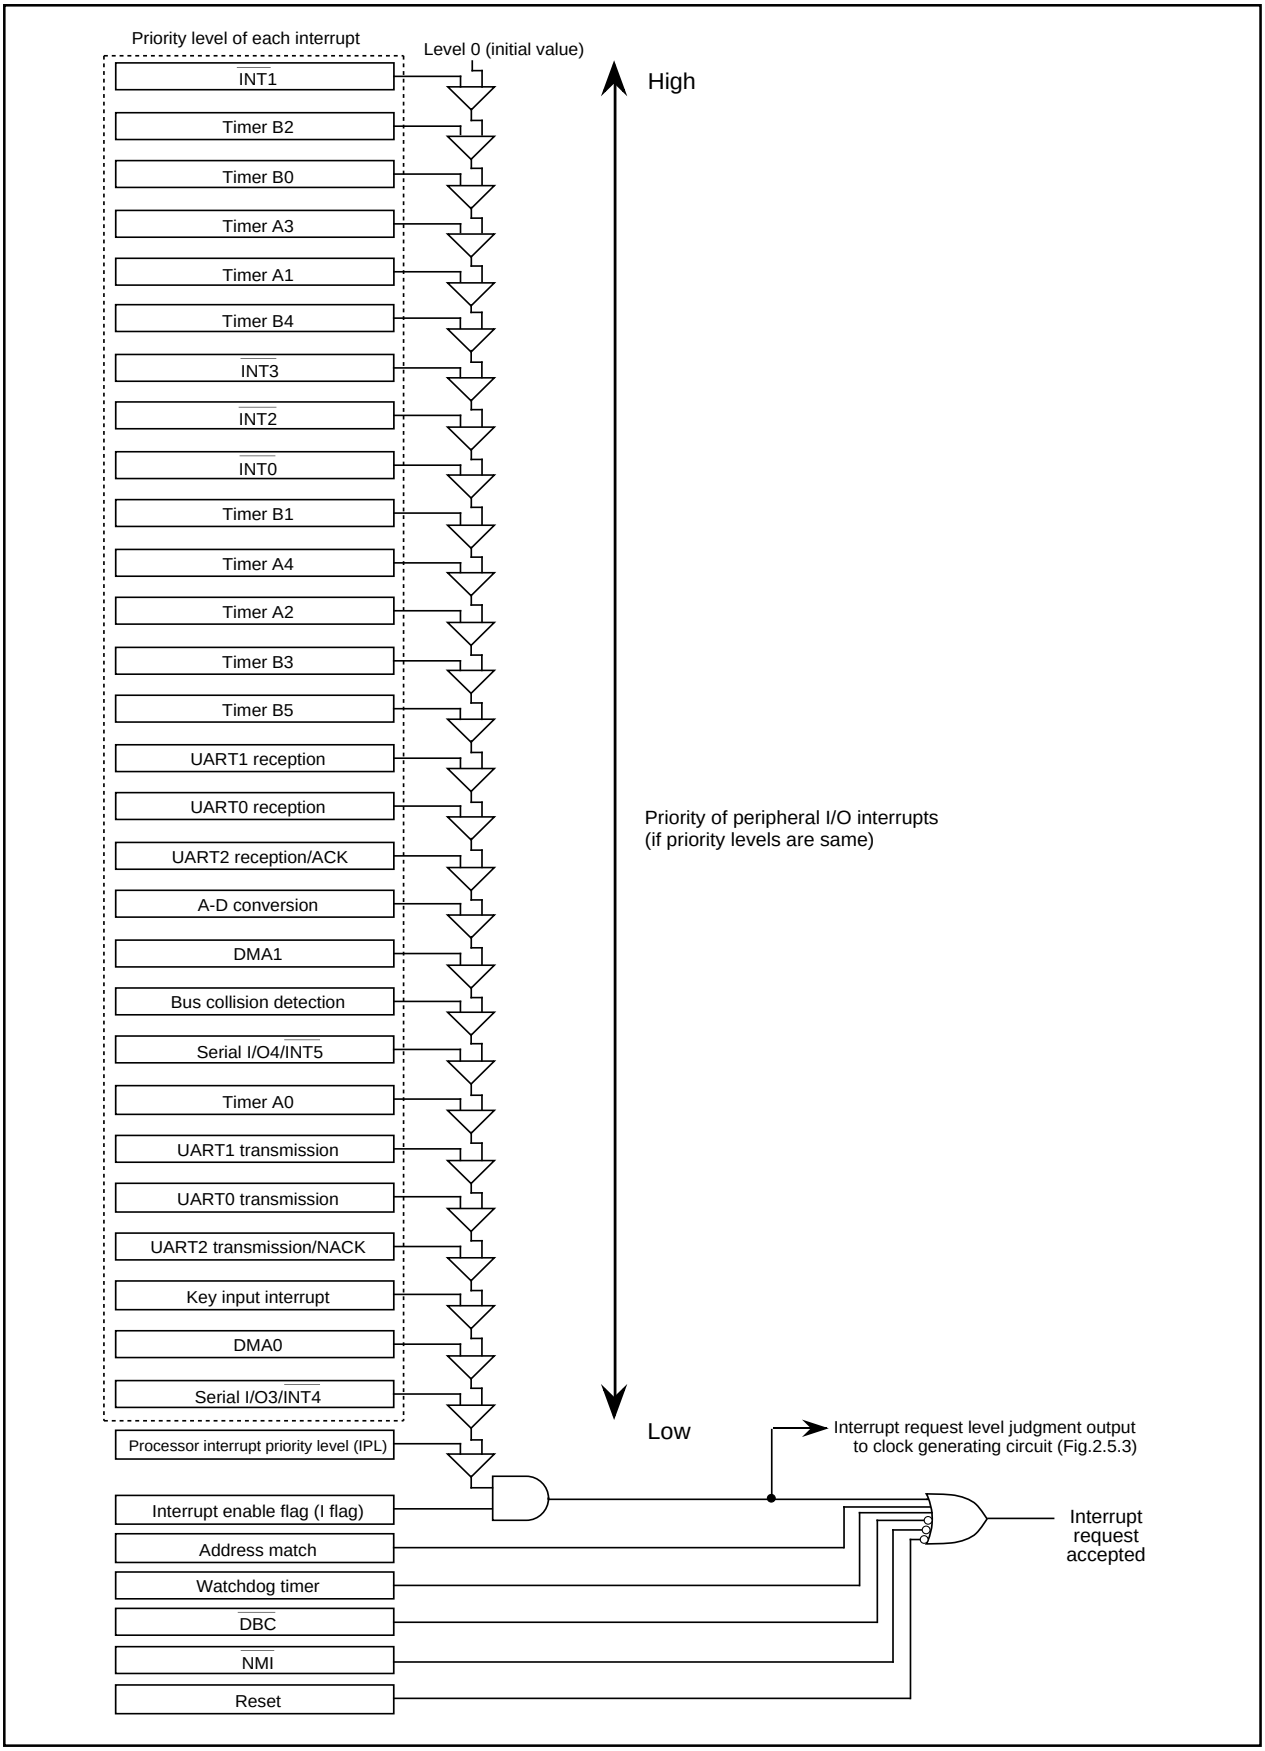

Figure 2.7.9 Maskable interrupts priorities (peripheral I/O interrupts)

2.7.7 $\overline{\text{INT}}$ Interrupt

$\overline{\text{INT0}}$ to $\overline{\text{INT5}}$ are triggered by the edges of external inputs. The edge polarity is selected using the polarity select bit.

Of interrupt control registers, 0048_{16} is used both as serial I/O4 and external interrupt $\overline{\text{INT5}}$ input control register, and 0049_{16} is used both as serial I/O3 and as external interrupt $\overline{\text{INT4}}$ input control register. Use the interrupt request cause select bits - bits 6 and 7 of the interrupt request cause select register ($035F_{16}$) - to specify which interrupt request cause to select. After having set an interrupt request cause, be sure to clear the corresponding interrupt request bit before enabling an interrupt.

Either of the interrupt control registers - 0048_{16}, 0049_{16} - has the polarity-switching bit. Be sure to set this bit to “0” to select an serial I/O as the interrupt request cause.

As for external interrupt input, an interrupt can be generated both at the rising edge and at the falling edge by setting “1” in the INTi interrupt polarity switching bit of the interrupt request cause select register ($035F_{16}$). To select both edges, set the polarity switching bit of the corresponding interrupt control register to ‘falling edge’ (“0”).

Figure 2.7.10 shows the Interrupt request cause select register.

Interrupt request cause select register

Symbol: IFSR | Address: $035F_{16}$ | When reset: 00_{16}

Bit symbol	Bit name	Fumction	R	W
IFSR0	INT0 interrupt polarity swiching bit	0 : One edge 1 : Two edges	○	○
IFSR1	INT1 interrupt polarity swiching bit	0 : One edge 1 : Two edges	○	○
IFSR2	INT2 interrupt polarity swiching bit	0 : One edge 1 : Two edges	○	○
IFSR3	INT3 interrupt polarity swiching bit	0 : One edge 1 : Two edges	○	○
IFSR4	INT4 interrupt polarity swiching bit	0 : One edge 1 : Two edges	○	○
IFSR5	INT5 interrupt polarity swiching bit	0 : One edge 1 : Two edges	○	○
IFSR6	Interrupt request cause select bit	0 : SIO3 1 : INT4	○	○
IFSR7	Interrupt request cause select bit	0 : SIO4 1 : INT5	○	○

Figure 2.7.10 Interrupt request cause select register

2.7.8 $\overline{\text{NMI}}$ Interrupt

An $\overline{\text{NMI}}$ interrupt is generated when the input to the P8$_5$/$\overline{\text{NMI}}$ pin changes from “H” to “L”. The $\overline{\text{NMI}}$ interrupt is a non-maskable external interrupt. The pin level can be checked in the port P8$_5$ register (bit 5 at address 03F0$_{16}$).

This pin cannot be used as a normal port input.

2.7.9 Key Input Interrupt

If the direction register of any of P10$_4$ to P10$_7$ is set for input and a falling edge is input to that port, a key input interrupt is generated. A key input interrupt can also be used as a key-on wakeup function for cancelling the wait mode or stop mode. However, if you intend to use the key input interrupt, do not use P10$_4$ to P10$_7$ as A-D input ports. Figure 2.7.11 shows the block diagram of the key input interrupt. Note that if an “L” level is input to any pin that has not been disabled for input, inputs to the other pins are not detected as an interrupt.

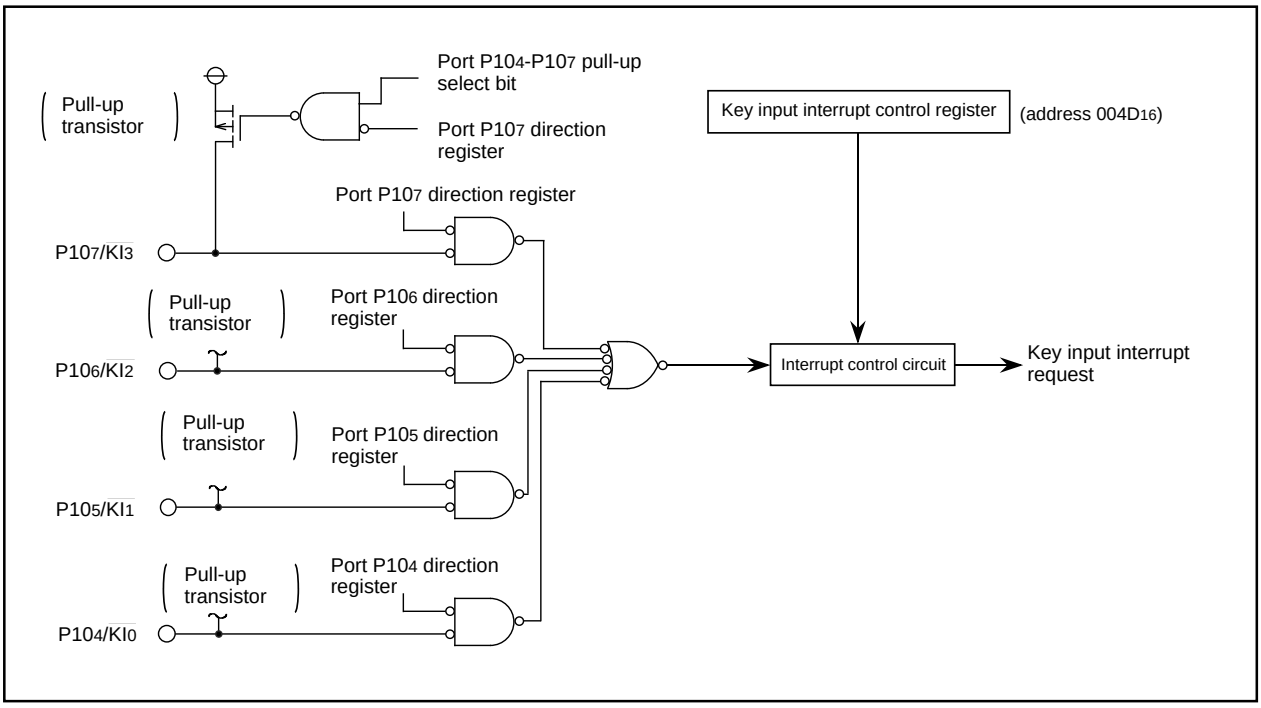

Figure 2.7.11 Block diagram of key input interrupt

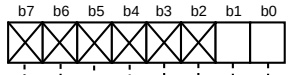
2.7.10 Address Match Interrupt

An address match interrupt is generated when the address match interrupt address register contents match the program counter value. Two address match interrupts can be set, each of which can be enabled and disabled by an address match interrupt enable bit. Address match interrupts are not affected by the interrupt enable flag (I flag) and processor interrupt priority level (IPL). The value of the program counter (PC) for an address match interrupt varies depending on the instruction being executed. Note that when using the external data bus in width of 8 bits, the address match interrupt cannot be used for external area.

Figure 2.7.12 shows the address match interrupt-related registers.

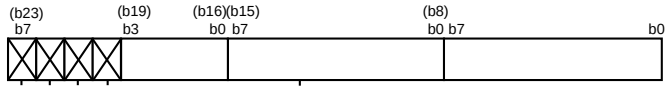
Address match interrupt enable register



Symbol	Address	When reset
AIER	0009_{16}	$XXXXXX00_2$

Bit symbol	Bit name	Function	R	W
AIER0	Address match interrupt 0 enable bit	0 : Interrupt disabled 1 : Interrupt enabled	○	○
AIER1	Address match interrupt 1 enable bit	0 : Interrupt disabled 1 : Interrupt enabled	○	○
Nothing is assigned. In an attempt to write to these bits, write “0”. The value, if read, turns out to be indeterminated.			—	—

Address match interrupt register i (i = 0, 1)



Symbol	Address	When reset
RMAD0	0012_{16} to 0010_{16}	$X00000_{16}$
RMAD1	0016_{16} to 0014_{16}	$X00000_{16}$

Function	Values that can be set	R	W
Address setting register for address match interrupt	00000_{16} to $FFFFF_{16}$	○	○
Nothing is assigned. In an attempt to write to these bits, write “0”. The value, if read, turns out to be indeterminated.		—	—

Figure 2.7.12 Address match interrupt-related registers

2.7.11 Precautions for Interrupts

(1) Reading address 00000_{16}

• When maskable interrupt is occurred, CPU read the interrupt information (the interrupt number and interrupt request level) in the interrupt sequence. The interrupt request bit of the certain interrupt written in address 00000_{16} will then be set to “0”. Reading address 00000_{16} by software sets enabled highest priority interrupt source request bit to “0”.
Though the interrupt is generated, the interrupt routine may not be executed.
Do not read address 00000_{16} by software.

(2) Setting the stack pointer

• The value of the stack pointer immediately after reset is initialized to 0000_{16}. Accepting an interrupt before setting a value in the stack pointer may become a factor of runaway. Be sure to set a value in the stack pointer before accepting an interrupt. When using the $\overline{\text{NMI}}$ interrupt, initialize the stack point at the beginning of a program. Concerning the first instruction immediately after reset, generating any interrupts including the $\overline{\text{NMI}}$ interrupt is prohibited.

(3) The $\overline{\text{NMI}}$ interrupt

• As for the $\overline{\text{NMI}}$ interrupt pin, an interrupt cannot be disabled. Connect it to the Vcc pin via a resistor (pull-up) if unused. Be sure to work on it.

• The $\overline{\text{NMI}}$ pin also serves as $P8_5$, which is exclusively input. Reading the contents of the P8 register allows reading the pin value. Use the reading of this pin only for establishing the pin level at the time when the $\overline{\text{NMI}}$ interrupt is input.

• Do not reset the CPU with the input to the $\overline{\text{NMI}}$ pin being in the “L” state.

• Do not attempt to go into stop mode with the input to the $\overline{\text{NMI}}$ pin being in the “L” state. With the input to the $\overline{\text{NMI}}$ being in the “L” state, the CM10 is fixed to “0”, so attempting to go into stop mode is turned down.

• Do not attempt to go into wait mode with the input to the $\overline{\text{NMI}}$ pin being in the “L” state. With the input to the $\overline{\text{NMI}}$ pin being in the “L” state, the CPU stops but the oscillation does not stop, so no power is saved. In this instance, the CPU is returned to the normal state by a later interrupt.

• Signals input to the $\overline{\text{NMI}}$ pin require an "L" level of 1 clock or more, from the operation clock of the CPU.

(4) External interrupt

• Either an “L” level or an “H” level of at least 250 ns width is necessary for the signal input to pins $\overline{\text{INT}_0}$ through $\overline{\text{INT}_5}$ regardless of the CPU operation clock.

• When the polarity of the $\overline{\text{INT}_0}$ to $\overline{\text{INT}_5}$ pins is changed, the interrupt request bit is sometimes set to "1". After changing the polarity, set the interrupt request bit to "0". Figure 2.7.13 shows the procedure for changing the $\overline{\text{INT}}$ interrupt generate factor.

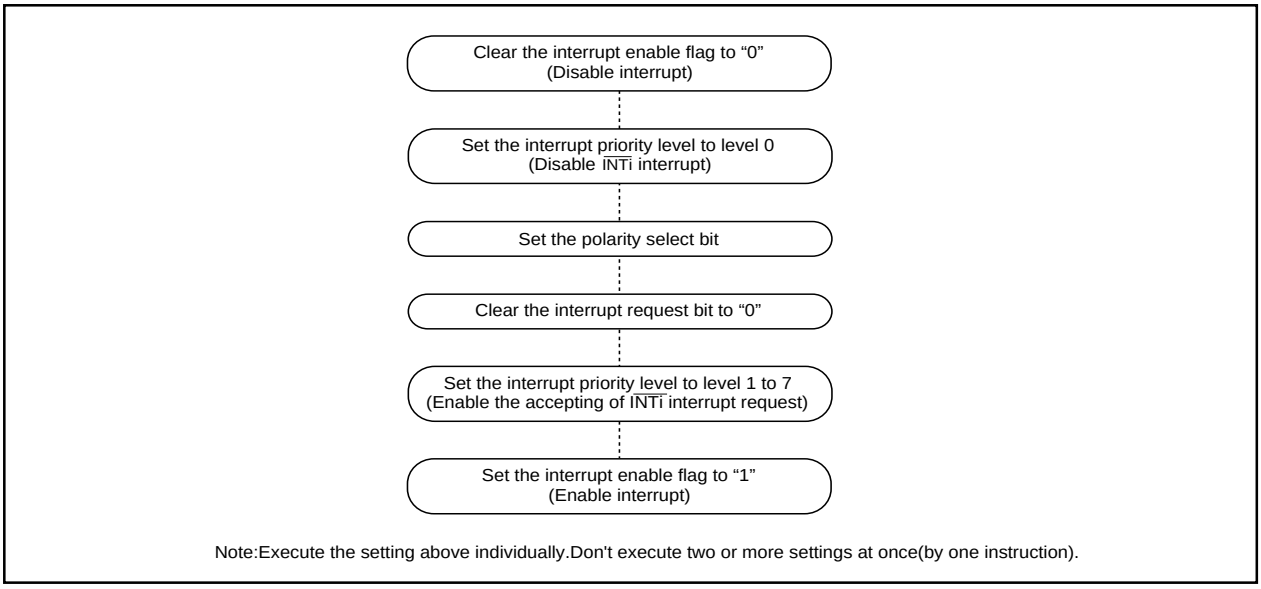


Figure 2.7.13 Switching condition of INT interrupt request

(5) Rewrite the interrupt control register

• To rewrite the interrupt control register, do so at a point that does not generate the interrupt request for that register. If there is possibility of the interrupt request occur, rewrite the interrupt control register after the interrupt is disabled. The program examples are described as follow:

Example 1:

```
INT_SWITCH1:
    FCLR    I              ; Disable interrupts.
    AND.B   #00h, 0055h    ; Clear TA0IC int. priority level and int. request bit.
    NOP                    ; Four NOP instructions are required when using HOLD function.
    NOP
    FSET    I              ; Enable interrupts.
```

Example 2:

```
INT_SWITCH2:
    FCLR    I              ; Disable interrupts.
    AND.B   #00h, 0055h    ; Clear TA0IC int. priority level and int. request bit.
    MOV.W   MEM, R0        ; Dummy read.
    FSET    I              ; Enable interrupts.
```

Example 3:

```
INT_SWITCH3:
    PUSHC   FLG            ; Push Flag register onto stack
    FCLR    I              ; Disable interrupts.
    AND.B   #00h, 0055h    ; Clear TA0IC int. priority level and int. request bit.
    POPC    FLG            ; Enable interrupts.
```

The reason why two NOP instructions (four when using the HOLD function) or dummy read are inserted before FSET I in Examples 1 and 2 is to prevent the interrupt enable flag I from being set before the interrupt control register is rewritten due to effects of the instruction queue.

• When a instruction to rewrite the interrupt control register is executed but the interrupt is disabled, the interrupt request bit is not set sometimes even if the interrupt request for that register has been generated. This will depend on the instruction. If this creates problems, use the below instructions to change the register.

Instructions : AND, OR, BCLR, BSET

2.8 Watchdog Timer

The watchdog timer has the function of detecting when the program is out of control. The watchdog timer is a 15-bit counter which down-counts the clock derived by dividing the BCLK using the prescaler. A watchdog timer interrupt is generated when an underflow occurs in the watchdog timer. When XIN is selected for the BCLK, bit 7 of the watchdog timer control register (address 000F16) selects the prescaler division ratio (by 16 or by 128). When XCIN is selected as the BCLK, the prescaler is set for division by 2 regardless of bit 7 of the watchdog timer control register (address 000F16). Thus the watchdog timer's period can be calculated as given below. The watchdog timer's period is, however, subject to an error due to the pre-scaler.

With XIN chosen for BCLK

$$\text{Watchdog timer period} = \frac{\text{pre-scaler dividing ratio (16 or 128) X watchdog timer count (32768)}}{\text{BCLK}}$$

With XCIN chosen for BCLK

$$\text{Watchdog timer period} = \frac{\text{pre-scaler dividing ratio (2) X watchdog timer count (32768)}}{\text{BCLK}}$$

For example, suppose that BCLK runs at 10 MHz and that 16 has been chosen for the dividing ratio of the pre-scaler, then the watchdog timer's period becomes approximately 52.4 ms.

The watchdog timer is initialized by writing to the watchdog timer start register (address 000E16) and when a watchdog timer interrupt request is generated. The prescaler is initialized only when the microcomputer is reset. After a reset is cancelled, the watchdog timer and prescaler are both stopped. The count is started by writing to the watchdog timer start register (address 000E16).
Figure 2.8.1 shows the block diagram of the watchdog timer. Figure 2.8.2 shows the watchdog timer-related registers.

2.9 DMAC

This microcomputer has two DMAC (direct memory access controller) channels that allow data to be sent to memory without using the CPU. DMAC shares the same data bus with the CPU. The DMAC is given a higher right of using the bus than the CPU, which leads to working the cycle stealing method. On this account, the operation from the occurrence of DMA transfer request signal to the completion of 1-word (16-bit) or 1-byte (8-bit) data transfer can be performed at high speed. Figure 2.9.1 shows the block diagram of the DMAC. Table 2.9.1 shows the DMAC specifications. Figures 2.9.2 to 2.9.4 show the registers used by the DMAC.

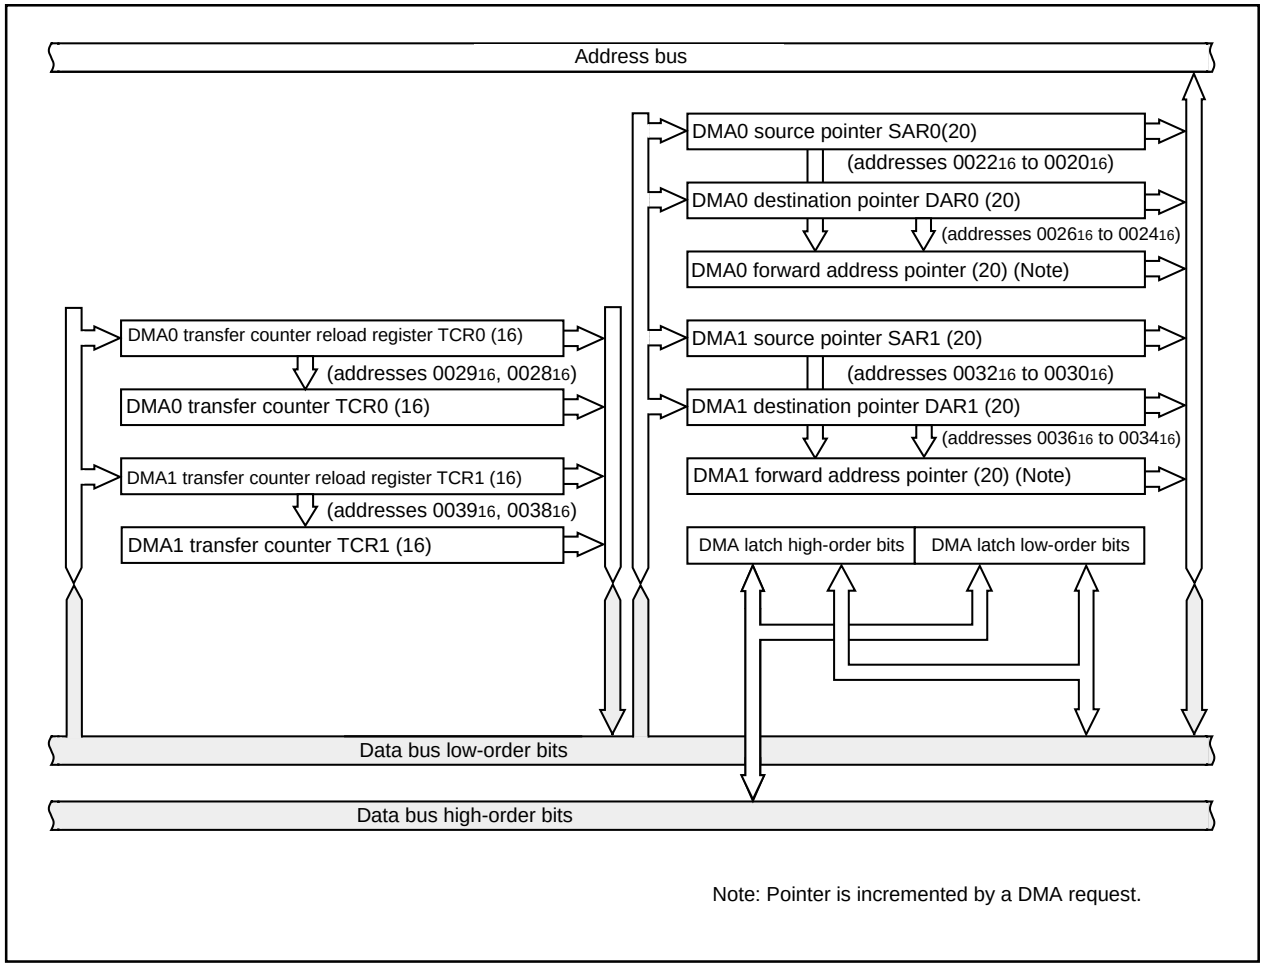

Figure 2.9.1 Block diagram of DMAC

Either a write signal to the software DMA request bit or an interrupt request signal is used as a DMA transfer request signal. But the DMA transfer is affected neither by the interrupt enable flag (I flag) nor by the interrupt priority level. The DMA transfer doesn't affect any interrupts either.

If the DMAC is active (the DMA enable bit is set to 1), data transfer starts every time a DMA transfer request signal occurs. If the cycle of the occurrences of DMA transfer request signals is higher than the DMA transfer cycle, there can be instances in which the number of transfer requests doesn't agree with the number of transfers. For details, see the description of the DMA request bit.

Table 2.9.1 DMAC specifications

Item	Specification
No. of channels	2 (cycle steal method)
Transfer memory space	• From any address in the 1M bytes space to a fixed address • From a fixed address to any address in the 1M bytes space • From a fixed address to a fixed address (Note that DMA-related registers [0020$_{16}$ to 003F$_{16}$] cannot be accessed)
Maximum No. of bytes transferred	128K bytes (with 16-bit transfers) or 64K bytes (with 8-bit transfers)
DMA request factors (Note)	Falling edge of $\overline{INT0}$ or $\overline{INT1}$ ($\overline{INT0}$ can be selected by DMA0, $\overline{INT1}$ by DMA1) or both edge Timer A0 to timer A4 interrupt requests Timer B0 to timer B5 interrupt requests UART0 transfer and reception interrupt requests UART1 transfer and reception interrupt requests UART2 transfer and reception interrupt requests Serial I/O3, 4 interrpt requests A-D conversion interrupt requests Software triggers
Channel priority	DMA0 takes precedence if DMA0 and DMA1 requests are generated simultaneously
Transfer unit	8 bits or 16 bits
Transfer address direction	forward/fixed (forward direction cannot be specified for both source and destination simultaneously)
Transfer mode	• Single transfer mode After the transfer counter underflows, the DMA enable bit turns to "0", and the DMAC turns inactive • Repeat transfer mode After the transfer counter underflows, the value of the transfer counter reload register is reloaded to the transfer counter. The DMAC remains active unless a "0" is written to the DMA enable bit.
DMA interrupt request generation timing	When an underflow occurs in the transfer counter
Active	When the DMA enable bit is set to "1", the DMAC is active. When the DMAC is active, data transfer starts every time a DMA transfer request signal occurs.
Inactive	• When the DMA enable bit is set to "0", the DMAC is inactive. • After the transfer counter underflows in single transfer mode
Forward address pointer and reload timing for transfer counter	At the time of starting data transfer immediately after turning the DMAC active, the value of one of source pointer and destination pointer - the one specified for the forward direction - is reloaded to the forward direction address pointer,and the value of the transfer counter reload register is reloaded to the transfer counter.
Writing to register	Registers specified for forward direction transfer are always write enabled. Registers specified for fixed address transfer are write-enabled when the DMA enable bit is "0".
Reading the register	Can be read at any time. However, when the DMA enable bit is "1", reading the register set up as the forward register is the same as reading the value of the forward address pointer.

Note: DMA transfer is not effective to any interrupt. DMA transfer is affected neither by the interrupt enable flag (I flag) nor by the interrupt priority level.

Figure 2.9.4 DMAC register (3)

(1) Transfer cycle

The transfer cycle consists of the bus cycle in which data is read from memory or from the SFR area (source read) and the bus cycle in which the data is written to memory or to the SFR area (destination write). The number of read and write bus cycles depends on the source and destination addresses and, the level of the BYTE pin. In memory expansion mode, the number of read and write bus cycles also depends on the level of the BYTE pin. Also, the bus cycle itself is longer when software waits are inserted.

(a) Effect of source and destination addresses

When 16-bit data is transferred on a 16-bit data bus, and the source and destination both start at odd addresses, there are one more source read cycle and destination write cycle than when the source and destination both start at even addresses.

(b) Effect of BYTE pin level

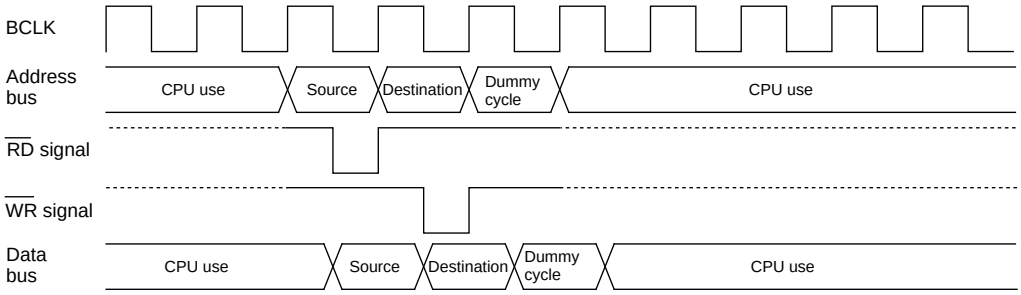
When transferring 16-bit data over an 8-bit data bus (BYTE pin = “H”) in memory expansion mode, the 16 bits of data are sent in two 8-bit blocks. Therefore, two bus cycles are required for reading the data and two are required for writing the data. Also, in contrast to when the CPU accesses internal memory, when the DMAC accesses internal memory (internal RAM, and SFR), these areas are accessed using the data size selected by the BYTE pin.

(c) Effect of software wait

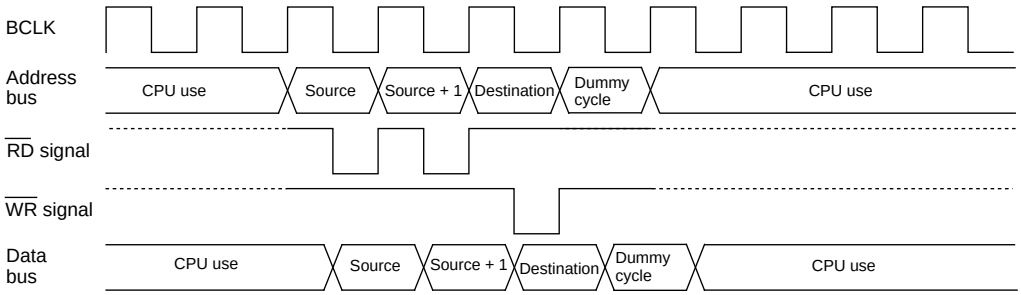
When the SFR area or a memory area with a software wait is accessed, the number of cycles is increased for the wait by 1 bus cycle. The length of the cycle is determined by BCLK.

Figure 2.9.5 shows the example of the transfer cycles for a source read. For convenience, the destination write cycle is shown as one cycle and the source read cycles for the different conditions are shown. In reality, the destination write cycle is subject to the same conditions as the source read cycle, with the transfer cycle changing accordingly. When calculating the transfer cycle, remember to apply the respective conditions to both the destination write cycle and the source read cycle. For example (2) in Figure 2.9.5, if data is being transferred in 16-bit units on an 8-bit bus, two bus cycles are required for both the source read cycle and the destination write cycle.

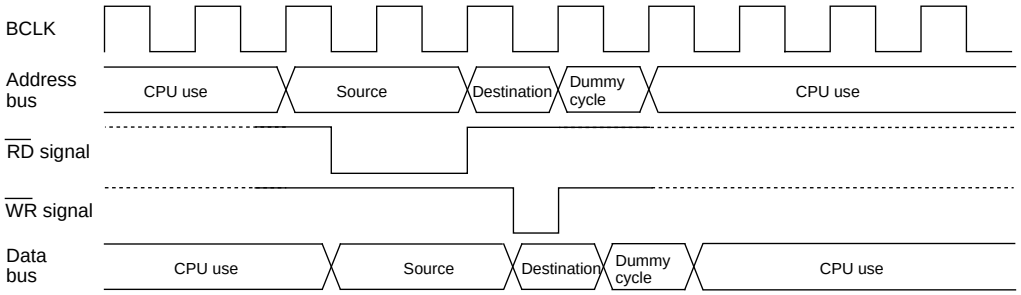
(1) 8-bit transfers
16-bit transfers from even address and the source address is even.



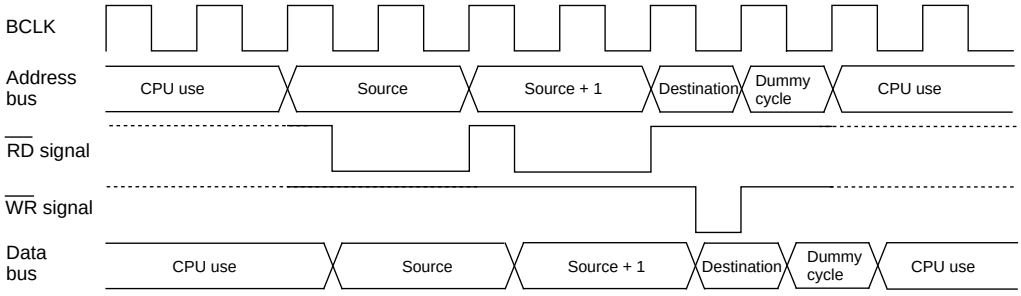
(2) 16-bit transfers and the source address is odd
Transferring 16-bit data on an 8-bit data bus (In this case, there are also two destination write cycles).



(3) One wait is inserted into the source read under the conditions in (1)



(4) One wait is inserted into the source read under the conditions in (2)
(When 16-bit data is transferred on an 8-bit data bus, there are two destination write cycles).



Note: The same timing changes occur with the respective conditions at the destination as at the source.

Figure 2.9.5 Example of the transfer cycles for a source read

(2) DMAC transfer cycles

Any combination of even or odd transfer read and write addresses is possible. Table 2.9.2 shows the number of DMAC transfer cycles.

The number of DMAC transfer cycles can be calculated as follows:

No. of transfer cycles per transfer unit = No. of read cycles x j + No. of write cycles x k

Table 2.9.2 No. of DMAC transfer cycles

Transfer unit	Bus width	Access address	Single-chip mode		Memory expansion mode	
			No. of read cycles	No. of write cycles	No. of read cycles	No. of write cycles
8-bit transfers (DMBIT= “1”)	16-bit (BYTE= “L”)	Even	1	1	1	1
		Odd	1	1	1	1
	8-bit (BYTE = “H”)	Even	–	–	1	1
		Odd	–	–	1	1
16-bit transfers (DMBIT= “0”)	16-bit (BYTE = “L”)	Even	1	1	1	1
		Odd	2	2	2	2
	8-bit (BYTE = “H”)	Even	–	–	2	2
		Odd	–	–	2	2

Coefficient j, k

Internal memory			External memory		
Internal ROM/RAM No wait	Internal ROM/RAM With wait	SFR area	Separate bus No wait	Separate bus With wait	Multiplex bus
1	2	2	1	2	3

2.9.1 DMA enable bit

Setting the DMA enable bit to "1" makes the DMAC active. The DMAC carries out the following operations at the time data transfer starts immediately after DMAC is turned active.

(1) Reloads the value of one of the source pointer and the destination pointer - the one specified for the forward direction - to the forward direction address pointer.

(2) Reloads the value of the transfer counter reload register to the transfer counter.

Thus overwriting "1" to the DMA enable bit with the DMAC being active carries out the operations given above, so the DMAC operates again from the initial state at the instant "1" is overwritten to the DMA enable bit.

2.9.2 DMA request bit

The DMAC can generate a DMA transfer request signal triggered by a factor chosen in advance out of DMA request factors for each channel.

DMA request factors include the following.

* Factors effected by using the interrupt request signals from the built-in peripheral functions and software DMA factors (internal factors) effected by a program.
* External factors effected by utilizing the input from external interrupt signals.

For the selection of DMA request factors, see the descriptions of the DMAi factor selection register.

The DMA request bit turns to "1" if the DMA transfer request signal occurs regardless of the DMAC's state (regardless of whether the DMA enable bit is set "1" or to "0"). It turns to "0" immediately before data transfer starts.

In addition, it can be set to "0" by use of a program, but cannot be set to "1".

There can be instances in which a change in DMA request factor selection bit causes the DMA request bit to turn to "1". So be sure to set the DMA request bit to "0" after the DMA request factor selection bit is changed.

The DMA request bit turns to "1" if a DMA transfer request signal occurs, and turns to "0" immediately before data transfer starts. If the DMAC is active, data transfer starts immediately, so the value of the DMA request bit, if read by use of a program, turns out to be "0" in most cases. To examine whether the DMAC is active, read the DMA enable bit.

Here follows the timing of changes in the DMA request bit.

(1) Internal factors

Except the DMA request factors triggered by software, the timing for the DMA request bit to turn to "1" due to an internal factor is the same as the timing for the interrupt request bit of the interrupt control register to turn to "1" due to several factors.

Turning the DMA request bit to "1" due to an internal factor is timed to be effected immediately before the transfer starts.

(2) External factors

An external factor is a factor caused to occur by the leading edge of input from the INTi pin (i depends on which DMAC channel is used).

Selecting the INTi pins as external factors using the DMA request factor selection bit causes input from these pins to become the DMA transfer request signals.

The timing for the DMA request bit to turn to "1" when an external factor is selected synchronizes with the signal's edge applicable to the function specified by the DMA request factor selection bit (synchronizes with the trailing edge of the input signal to each INTi pin, for example).

With an external factor selected, the DMA request bit is timed to turn to "0" immediately before data transfer starts similarly to the state in which an internal factor is selected.

(3) The priorities of channels and DMA transfer timing

If a DMA transfer request signal falls on a single sampling cycle (a sampling cycle means one period from the leading edge to the trailing edge of BCLK), the DMA request bits of applicable channels concurrently turn to "1". If the channels are active at that moment, DMA0 is given a high priority to start data transfer. When DMA0 finishes data transfer, it gives the bus right to the CPU. When the CPU finishes single bus access, then DMA1 starts data transfer and gives the bus right to the CPU.

An example in which DMA transfer is carried out in minimum cycles at the time when DMA transfer request signals due to external factors concurrently occur.

Figure 2.9.6 An example of DMA transfer effected by external factors.

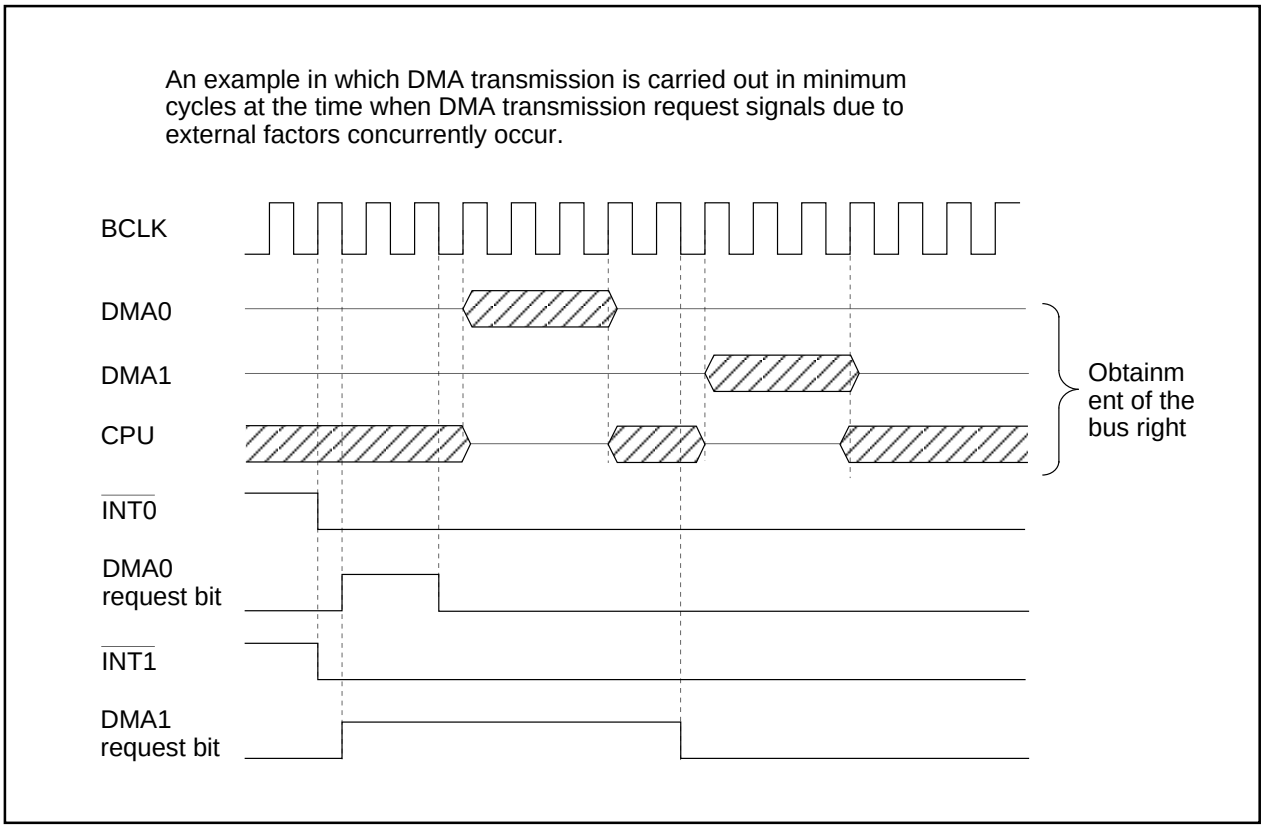


Figure 2.9.6 An example of DMA transfer effected by external factors

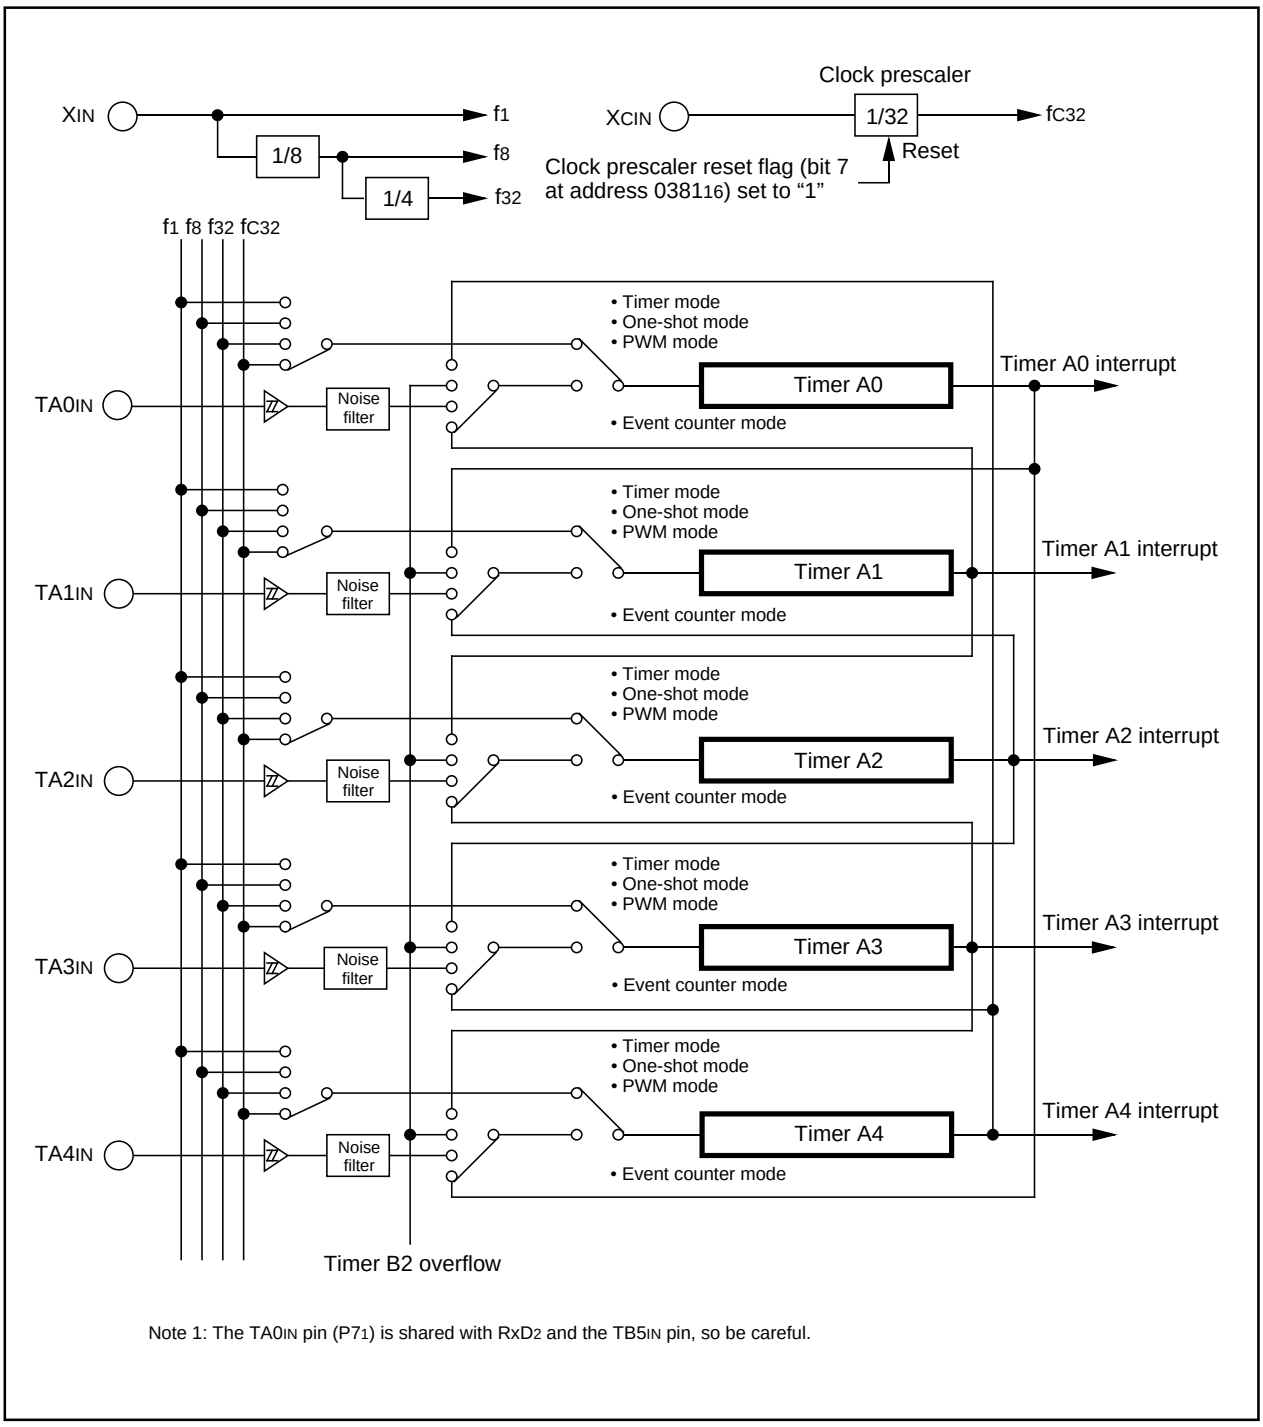
2.10 Timer

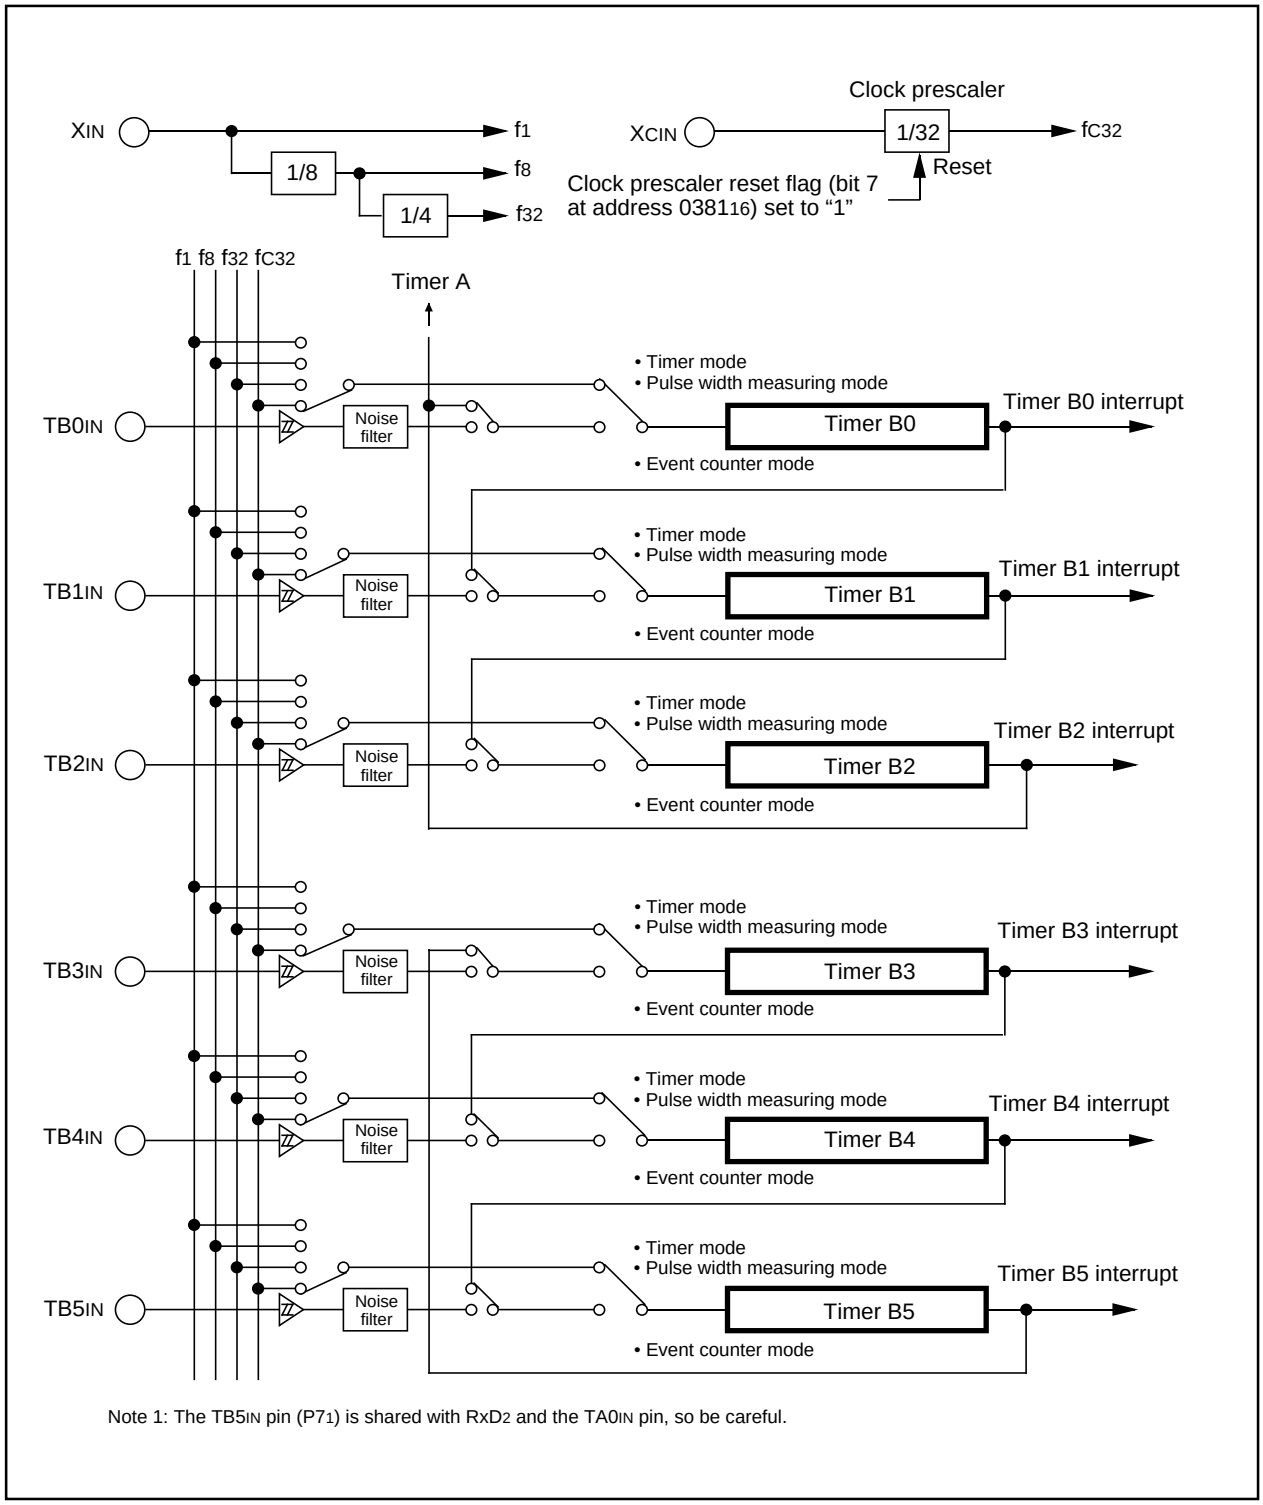
There are eleven 16-bit timers. These timers can be classified by function into timers A (five) and timers B (six). All these timers function independently.

Figures 2.10.1 and 2.10.2 show the block diagram of timers.



Note 1: The TA0IN pin (P71) is shared with RxD2 and the TB5IN pin, so be careful.

Figure 2.10.1 Timer A block diagram



Note 1: The TB5IN pin (P71) is shared with RxD2 and the TA0IN pin, so be careful.

Figure 2.10.2 Timer B block diagram

2.10.1 Timer A

Figure 2.10.3 shows the block diagram of timer A. Figures 2.10.4 to 2.10.6 show the timer A-related registers.

Except in event counter mode, timers A0 through A4 all have the same function. Use the timer Ai mode register (i = 0 to 4) bits 0 and 1 to choose the desired mode.

Timer A has the four operation modes listed as follows:

- Timer mode: The timer counts an internal count source.
- Event counter mode: The timer counts pulses from an external source or a timer over flow.
- One-shot timer mode: The timer stops counting when the count reaches "0000_{16}".
- Pulse width modulation (PWM) mode: The timer outputs pulses of a given width.

Figure 2.10.6 Timer A-related registers (3)

(1) Timer mode

In this mode, the timer counts an internally generated count source. (See Table 2.10.1) Figure 2.10.7 shows the timer Ai mode register in timer mode.

Table 2.10.1 Specifications of timer mode

Item	Specification
Count source	f_1, f_8, f_{32}, f_{C32}
Count operation	• Down count • When the timer underflows, it reloads the reload register contents before continuing counting
Divide ratio	1/(n+1) n : Set value
Count start condition	Count start flag is set (= 1)
Count stop condition	Count start flag is reset (= 0)
Interrupt request generation timing	When the timer underflows
TAiIN pin function	Programmable I/O port or gate input
TAiOUT pin function	Programmable I/O port or pulse output
Read from timer	Count value can be read out by reading timer Ai register
Write to timer	• When counting stopped When a value is written to timer Ai register, it is written to both reload register and counter • When counting in progress When a value is written to timer Ai register, it is written to only reload register (Transferred to counter at next reload time)
Select function	• Gate function Counting can be started and stopped by the TAiIN pin's input signal • Pulse output function Each time the timer underflows, the TAiOUT pin's polarity is reversed

Timer Ai mode register

b7	b6	b5	b4	b3	b2	b1	b0
		0				0	0

Symbol: TAiMR(i=0 to 4) Address: 039_{16} to $039A_{16}$ When reset: 00_{16}

Bit symbol	Bit name	Function	R	W
TMOD0	Operation mode select bit	b1 b0 0 0 : Timer mode	○	○
TMOD1			○	○
MR0	Pulse output function select bit	0 : Pulse is not output (TAiOUT pin is a normal port pin) 1 : Pulse is output (Note 1) (TAiOUT pin is a pulse output pin)	○	○
MR1	Gate function select bit	b4 b3 0 X (Note 2): Gate function not available (TAiIN pin is a normal port pin) 1 0 : Timer counts only when TAiIN pin is held "L" (Note 3) 1 1 : Timer counts only when TAiIN pin is held "H" (Note 3)	○	○
MR2			○	○
MR3	0 (Must always be fixed to "0" in timer mode)		○	○
TCK0	Count source select bit	b7 b6 0 0 : f_1 0 1 : f_8 1 0 : f_{32} 1 1 : f_{C32}	○	○
TCK1			○	○

Note 1: The settings of the corresponding port register and port direction register are invalid.
Note 2: The bit can be "0" or "1".
Note 3: Set the corresponding port direction register to "0".

Figure 2.10.7 Timer Ai mode register in timer mode

(2) Event counter mode

In this mode, the timer counts an external signal or an internal timer's overflow. Timers A0 and A1 can count a single-phase external signal. Timers A2, A3, and A4 can count a single-phase and a two-phase external signal. Table 2.10.2 lists timer specifications when counting a single-phase external signal. Figure 2.10.8 shows the timer Ai mode register in event counter mode.

Table 2.10.3 lists timer specifications when counting a two-phase external signal. Figure 2.10.9 shows the timer Ai mode register in event counter mode.

Table 2.10.2 Timer specifications in event counter mode (when not processing two-phase pulse signal)

Item	Specification
Count source	• External signals input to TAiIN pin (effective edge can be selected by software) • TB2 overflow, TAj overflow
Count operation	• Up count or down count can be selected by external signal or software • When the timer overflows or underflows, it reloads the reload register contents before continuing counting (Note)
Divide ratio	1/ ($FFFF_{16}$ - n + 1) for up count 1/ (n + 1) for down count n : Set value
Count start condition	Count start flag is set (= 1)
Count stop condition	Count start flag is reset (= 0)
Interrupt request generation timing	The timer overflows or underflows
TAiIN pin function	Programmable I/O port or count source input
TAiOUT pin function	Programmable I/O port, pulse output, or up/down count select input
Read from timer	Count value can be read out by reading timer Ai register
Write to timer	• When counting stopped When a value is written to timer Ai register, it is written to both reload register and counter • When counting in progress When a value is written to timer Ai register, it is written to only reload register (Transferred to counter at next reload time)
Select function	• Free-run count function Even when the timer overflows or underflows, the reload register content is not reloaded to it • Pulse output function Each time the timer overflows or underflows, the TAiOUT pin's polarity is reversed

Note: This does not apply when the free-run function is selected.

Timer Ai mode register

b7	b6	b5	b4	b3	b2	b1	b0
		0				0	1

Symbol: TAiMR(i = 0, 1) Address: 0396_{16}, 0397_{16} When reset: 00_{16}

Bit symbol	Bit name	Function	R	W
TMOD0	Operation mode select bit	b1 b0 0 1 : Event counter mode (Note 1)	○	○
TMOD1			○	○
MR0	Pulse output function select bit	0 : Pulse is not output (TAiOUT pin is a normal port pin) 1 : Pulse is output (Note 2) (TAiOUT pin is a pulse output pin)	○	○
MR1	Count polarity select bit (Note 3)	0 : Counts external signal's falling edge 1 : Counts external signal's rising edge	○	○
MR2	Up/down switching cause select bit	0 : Up/down flag's content 1 : TAiOUT pin's input signal (Note 4)	○	○
MR3	0 (Must always be fixed to "0" in event counter mode)		○	○
TCK0	Count operation type select bit	0 : Reload type 1 : Free-run type(Note 5)	○	○
TCK1	Invalid in event counter mode Can be "0" or "1"		○	○

Note 1: In event counter mode, the count source is selected by the event / trigger select bit (addresses 0382_{16} and 0383_{16}).
Note 2: The settings of the corresponding port register and port direction register are invalid.
Note 3: Valid only when counting an external signal.
Note 4: When an "L" signal is input to the TAiOUT pin, the downcount is activated. When "H", the upcount is activated. Set the corresponding port direction register to "0".
Note 5: In the case of using "Event counter mode" as "Free-Run type", the timer register contents may be unkown when counting begins.(Refer 3. Usage Precaution.)

Figure 2.10.8 Timer Ai mode register in event counter mode

Table 2.10.3 Timer specifications in event counter mode (when processing two-phase pulse signal with timers A2, A3, and A4)

Item	Specification
Count source	• Two-phase pulse signals input to TAiIN or TAiOUT pin
Count operation	• Up count or down count can be selected by two-phase pulse signal • When the timer overflows or underflows, the reload register content is reloaded and the timer starts over again (Note1)
Divide ratio	1/ ($FFFF_{16}$ - n + 1) for up count 1/ (n + 1) for down count n : Set value
Count start condition	Count start flag is set (= 1)
Count stop condition	Count start flag is reset (= 0)
Interrupt request generation timing	Timer overflows or underflows
TAiIN pin function	Two-phase pulse input
TAiOUT pin function	Two-phase pulse input
Read from timer	Count value can be read out by reading timer A2, A3, or A4 register
Write to timer	• When counting stopped When a value is written to timer A2, A3, or A4 register, it is written to both reload register and counter • When counting in progress When a value is written to timer A2, A3, or A4 register, it is written to only reload register. (Transferred to counter at next reload time.)
Select function(Note 2)	• Normal processing operation (Timer A2 and Timer A3) The timer counts up rising edges or counts down falling edges on the TAiIN pin when input signal on the TAiOUT pin is “H”  • Multiply-by-4 processing operation (Timer A3 and Timer A4) If the phase relationship is such that the TAiIN pin goes “H” when the input signal on the TAiOUT pin is “H”, the timer counts up rising and falling edges on the TAiOUT and TAiIN pins. If the phase relationship is such that the TAiIN pin goes “L” when the input signal on the TAiOUT pin is “H”, the timer counts down rising and falling edges on the TAiOUT and TAiIN pins. 
Note 1: This does not apply when the free-run function is selected.
Note 2: Timer A3 alone can be selected.Timer A2 is fixed to normal processing operation,and timer A4 is fixed to multiply-by-4 processing operation.

Timer Ai mode register
(When not using two-phase pulse signal processing)

b7	b6	b5	b4	b3	b2	b1	b0
		0				0	1

Symbol: TAiMR(i = 2 to 4) | Address: 0398$_{16}$ to 039A$_{16}$ | When reset: 00$_{16}$

Bit symbol	Bit name	Function	R	W
TMOD0	Operation mode select bit	b1 b0 0 1 : Event counter mode (Note 1)	○	○
TMOD1			○	○
MR0	Pulse output function select bit	0 : Pulse is not output (TA$_{iOUT}$ pin is a normal port pin) 1 : Pulse is output (Note 2) (TA$_{iOUT}$ pin is a pulse output pin)	○	○
MR1	Count polarity select bit (Note 3)	0 : Counts external signal's falling edge 1 : Counts external signal's rising edge	○	○
MR2	Up/down switching cause select bit	0 : Up/down flag's content 1 : TA$_{iOUT}$ pin's input signal (Note 4)	○	○
MR3	0 (Must always be fixed to "0" in event counter mode)		○	○
TCK0	Count operation type select bit	0 : Reload type 1 : Free-run type(Note 5)	○	○
TCK1	Invalid in event counter mode Can be "0" or "1"		○	○

Note 1: In event counter mode, the count source is selected by the event / trigger select bit (addresses 0382$_{16}$ and 0383$_{16}$).
Note 2: The settings of the corresponding port register and port direction register are invalid.
Note 3: Valid only when counting an external signal.
Note 4: When an "L" signal is input to the TAi $_{OUT}$ pin, the downcount is activated. When "H", the upcount is activated. Set the corresponding port direction register to "0".
Note 5: In the case of using "Event counter mode" as "Free-Run type", the timer register contents may be unkown when counting begins.(Refer 3. Usage Precaution.)

Timer Ai mode register
(When using two-phase pulse signal processing)

b7	b6	b5	b4	b3	b2	b1	b0
		0	1	0	0	0	1

Symbol: TAiMR(i = 2 to 4) | Address: 0398$_{16}$ to 039A$_{16}$ | When reset: 00$_{16}$

Bit symbol	Bit name	Function	R	W
TMOD0	Operation mode select bit	b1 b0 0 1 : Event counter mode	○	○
TMOD1			○	○
MR0	0 (Must always be "0" when using two-phase pulse signal processing)		○	○
MR1	0 (Must always be "0" when using two-phase pulse signal processing)		○	○
MR2	1 (Must always be "1" when using two-phase pulse signal processing)		○	○
MR3	0 (Must always be "0" when using two-phase pulse signal processing)		○	○
TCK0	Count operation type select bit	0 : Reload type 1 : Free-run type(Note 3)	○	○
TCK1	Two-phase pulse processing operation select bit (Note 1)(Note 2)	0 : Normal processing operation 1 : Multiply-by-4 processing operation	○	○

Note 1: This bit is valid for timer A3 mode register. Timer A2 is fixed to normal processing operation, and timer A4 is fixed to multiply-by-4 processing operation.
Note 2: When performing two-phase pulse signal processing, make sure the two-phase pulse signal processing operation select bit (address 0384$_{16}$) is set to "1". Also, always be sure to set the event/trigger select bit (address 0383$_{16}$) to "00".
Note 3: In the case of using "Event counter mode" as "Free-Run type", the timer register contents may be unkown when counting begins.(Refer 3. Usage Precaution.)

Figure 2.10.9 Timer Ai mode register in event counter mode

(3) One-shot timer mode

In this mode, the timer operates only once. (See Table 2.10.4) When a trigger occurs, the timer starts up and continues operating for a given period. Figure 2.10.10 shows the timer Ai mode register in one-shot timer mode.

Table 2.10.4 Timer specifications in one-shot timer mode

Item	Specification
Count source	f_1, f_8, f_{32}, f_{C32}
Count operation	• The timer counts down • When the count reaches 0000_{16}, the timer stops counting after reloading a new count • If a trigger occurs when counting, the timer reloads a new count and restarts counting
Divide ratio	1/n n : Set value
Count start condition	• An external trigger is input • The timer overflows • The one-shot start flag is set (= 1)
Count stop condition	• A new count is reloaded after the count has reached 0000_{16} • The count start flag is reset (= 0)
Interrupt request generation timing	The count reaches 0000_{16}
TAiIN pin function	Programmable I/O port or trigger input
TAiOUT pin function	Programmable I/O port or pulse output
Read from timer	When timer Ai register is read, it indicates an indeterminate value
Write to timer	• When counting stopped When a value is written to timer Ai register, it is written to both reload register and counter • When counting in progress When a value is written to timer Ai register, it is written to only reload register (Transferred to counter at next reload time)

Timer Ai mode register

b7	b6	b5	b4	b3	b2	b1	b0
		0				1	0

Symbol: TAiMR(i = 0 to 4) Address: 0396_{16} to $039A_{16}$ When reset: 00_{16}

Bit symbol	Bit name	Function	R	W
TMOD0	Operation mode select bit	b1 b0 1 0 : One-shot timer mode	○	○
TMOD1			○	○
MR0	Pulse output function select bit	0 : Pulse is not output (TAiOUT pin is a normal port pin) 1 : Pulse is output (Note 1) (TAiOUT pin is a pulse output pin)	○	○
MR1	External trigger select bit (Note 2)	0 : Falling edge of TAiIN pin's input signal (Note 3) 1 : Rising edge of TAiIN pin's input signal (Note 3)	○	○
MR2	Trigger select bit	0 : One-shot start flag is valid 1 : Selected by event/trigger select register	○	○
MR3	0 (Must always be "0" in one-shot timer mode)		○	○
TCK0	Count source select bit	b7 b6 0 0 : f_1 0 1 : f_8 1 0 : f_{32} 1 1 : f_{C32}	○	○
TCK1			○	○

Note 1: The settings of the corresponding port register and port direction register are invalid.
Note 2: Valid only when the TAiIN pin is selected by the event/trigger select bit (addresses 0382_{16} and 0383_{16}). If timer overflow is selected, this bit can be "1" or "0".
Note 3: Set the corresponding port direction register to "0".

Figure 2.10.10 Timer Ai mode register in one-shot timer mode

(4) Pulse width modulation (PWM) mode

In this mode, the timer outputs pulses of a given width in succession. (See Table 2.10.5) In this mode, the counter functions as either a 16-bit pulse width modulator or an 8-bit pulse width modulator. Figure 2.10.11 shows the timer Ai mode register in pulse width modulation mode. Figure 2.10.12 shows the example of how a 16-bit pulse width modulator operates. Figure 2.10.13 shows the example of how an 8-bit pulse width modulator operates.

Table 2.10.5 Timer specifications in pulse width modulation mode

Item	Specification
Count source	f_1, f_8, f_{32}, f_{C32}
Count operation	• The timer counts down (operating as an 8-bit or a 16-bit pulse width modulator) • The timer reloads a new count at a rising edge of PWM pulse and continues counting • The timer is not affected by a trigger that occurs when counting
16-bit PWM	• High level width n / fi n : Set value • Cycle time $(2^{16}-1)$ / fi fixed
8-bit PWM	• High level width n×(m+1) / fi n : values set to timer Ai register's high-order address • Cycle time $(2^{8}-1)\times(m+1)$ / fi m : values set to timer Ai register's low-order address
Count start condition	• External trigger is input • The timer overflows • The count start flag is set (= 1)
Count stop condition	• The count start flag is reset (= 0)
Interrupt request generation timing	PWM pulse goes "L"
TAiIN pin function	Programmable I/O port or trigger input
TAiOUT pin function	Pulse output
Read from timer	When timer Ai register is read, it indicates an indeterminate value
Write to timer	• When counting stopped When a value is written to timer Ai register, it is written to both reload register and counter • When counting in progress When a value is written to timer Ai register, it is written to only reload register (Transferred to counter at next reload time)

Timer Ai mode register

b7	b6	b5	b4	b3	b2	b1	b0
					1	1	1

Symbol	Address	When reset
TAiMR(i=0 to 4)	039_{16} to $039A_{16}$	00_{16}

Bit symbol	Bit name	Function	R	W

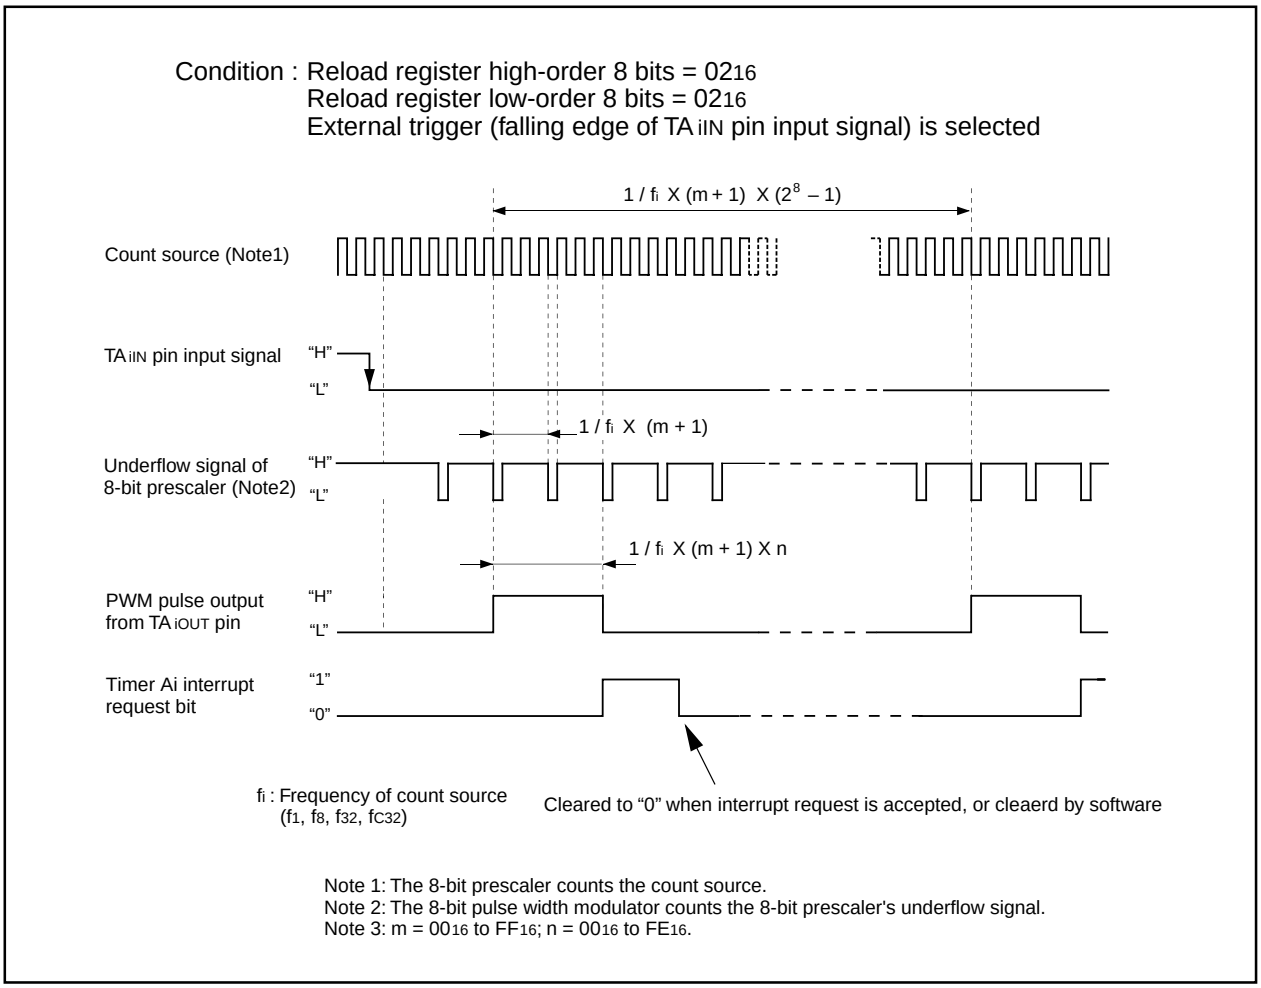

Figure 2.10.13 Example of how an 8-bit pulse width modulator operates

2.10.2 Timer B

Figure 2.10.14 shows the block diagram of timer B. Figures 2.10.15 and 2.10.16 show the timer B-related registers.

Use the timer Bi mode register (i = 0 to 5) bits 0 and 1 to choose the desired mode.

Timer B has three operation modes listed as follows:

- Timer mode: The timer counts an internal count source.
- Event counter mode: The timer counts pulses from an external source or a timer overflow.
- Pulse period/pulse width measuring mode: The timer measures an external signal's pulse period or pulse width.

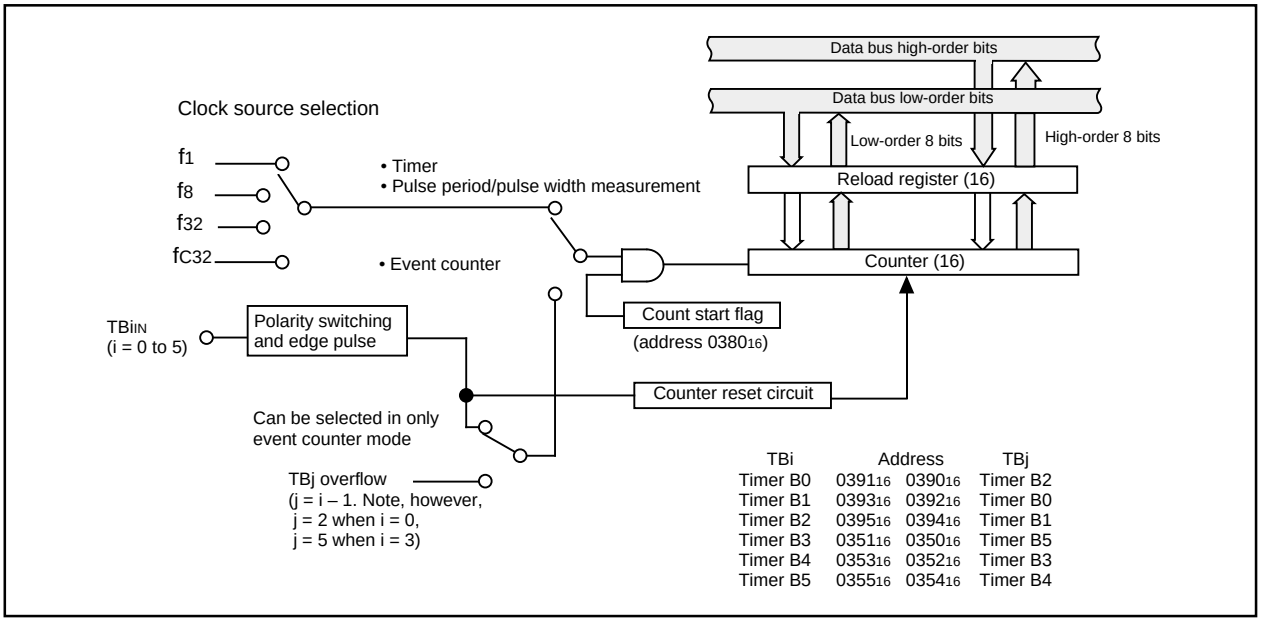

Figure 2.10.14 Block diagram of timer B

Timer Bi mode register

MR3	Invalid in event counter mode. In an attempt to write to this bit, write "0". The value, if read in event counter mode, turns out to be indeterminate.		○	×
TCK0	Invalid in event counter mode. Can be "0" or "1".		○	○
TCK1	Event clock select	0 : Input from TBiIN pin (Note 4) 1 : TBj overflow (j = i – 1; however, j = 2 when i = 0, j = 5 when i = 3)	○	○

Note 1: Valid only when input from the TBiIN pin is selected as the event clock.
If timer's overflow is selected, this bit can be "0" or "1".
Note 2: Timer B0, timer B3.
Note 3: Timer B1, timer B2, timer B4, timer B5.
Note 4: Set the corresponding port direction register to "0".

Figure 2.10.18 Timer Bi mode register in event counter mode

(3) Pulse period/pulse width measurement mode

In this mode, the timer measures the pulse period or pulse width of an external signal. (See Table 2.10.8) Figure 2.10.19 shows the timer Bi mode register in pulse period/pulse width measurement mode. Figure 2.10.20 shows the operation timing when measuring a pulse period. Figure 2.10.21 shows the operation timing when measuring a pulse width.

Table 2.10.8 Timer specifications in pulse period/pulse width measurement mode

Item	Specification
Count source	f_1, f_8, f_{32}, f_{C32}
Count operation	• Up count • Counter value "0000_{16}" is transferred to reload register at measurement pulse's effective edge and the timer continues counting
Count start condition	Count start flag is set (= 1)
Count stop condition	Count start flag is reset (= 0)
Interrupt request generation timing	• When measurement pulse's effective edge is input (Note 1) • When an overflow occurs. (Simultaneously, the timer Bi overflow flag changes to "1". The timer Bi overflow flag changes to "0" when the count start flag is "1" and a value is written to the timer Bi mode register.)
TBi_{IN} pin function	Measurement pulse input
Read from timer	When timer Bi register is read, it indicates the reload register's content (measurement result) (Note 2)
Write to timer	Cannot be written to

Note 1: An interrupt request is not generated when the first effective edge is input after the timer has started counting.
Note 2: The value read out from the timer Bi register is indeterminate until the second effective edge is input after the timer.

Timer Bi mode register

b7	b6	b5	b4	b3	b2	b1	b0
						1	0

Symbol	Address	When reset
TBiMR(i=0 to 5)	$039B_{16}$ to $039D_{16}$	$00XX0000_2$
	$035B_{16}$ to $035D_{16}$	$00XX0000_2$

Bit symbol	Bit name	Function	R	W
TMOD0	Operation mode select bit	b1 b0 1 0 : Pulse period / pulse width measurement mode	○	○
TMOD1			○	○
MR0	Measurement mode select bit	b3 b2 0 0 : Pulse period measurement (Interval between measurement pulse's falling edge to falling edge) 0 1 : Pulse period measurement (Interval between measurement pulse's rising edge to rising edge) 1 0 : Pulse width measurement (Interval between measurement pulse's falling edge to rising edge, and between rising edge to falling edge) 1 1 : Inhibited	○	○
MR1			○	○
MR2	0 (Fixed to "0" in pulse period/pulse width measurement mode; i = 0, 3)		○ (Note 2)	○
	Nothing is assigned (i = 1, 2, 4, 5). In an attempt to write to this bit, write "0". The value, if read, turns out to be indeterminate.		× (Note 3)	×
MR3	Timer Bi overflow flag (Note 1)	0 : Timer did not overflow 1 : Timer has overflowed	○	×
TCK0	Count source select bit	b7 b6 0 0 : f_1 0 1 : f_8 1 0 : f_{32} 1 1 : f_{C32}	○	○
TCK1			○	○

Note 1: It is Indeterminate when reset. The timer Bi overflow flag changes to "0" when the count start flag is "1" and a value is written to the timer Bi mode register. This flag cannot be set to "1" by software.
Note 2: Timer B0, timer B3.
Note 3: Timer B1, timer B2, timer B4, timer B5.

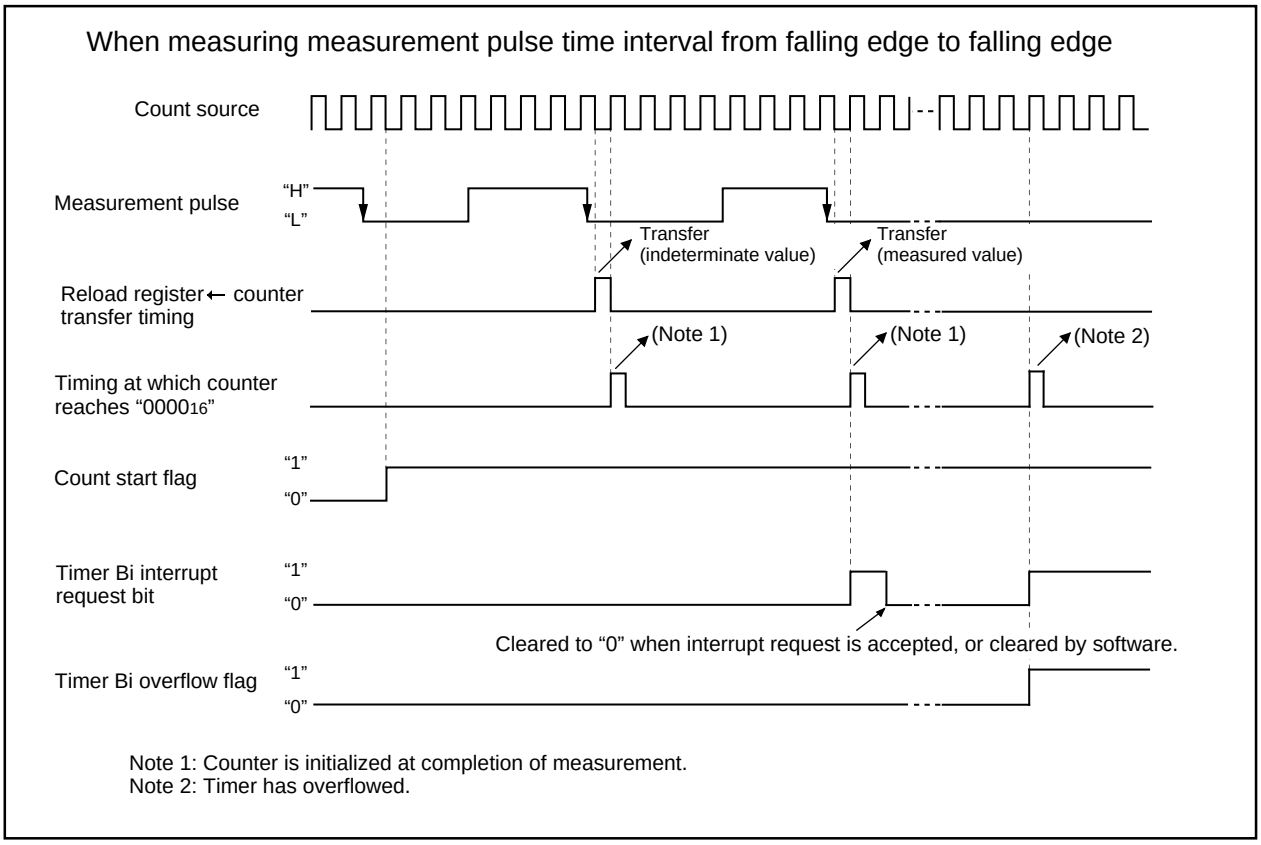

Figure 2.10.20 Operation timing when measuring a pulse period

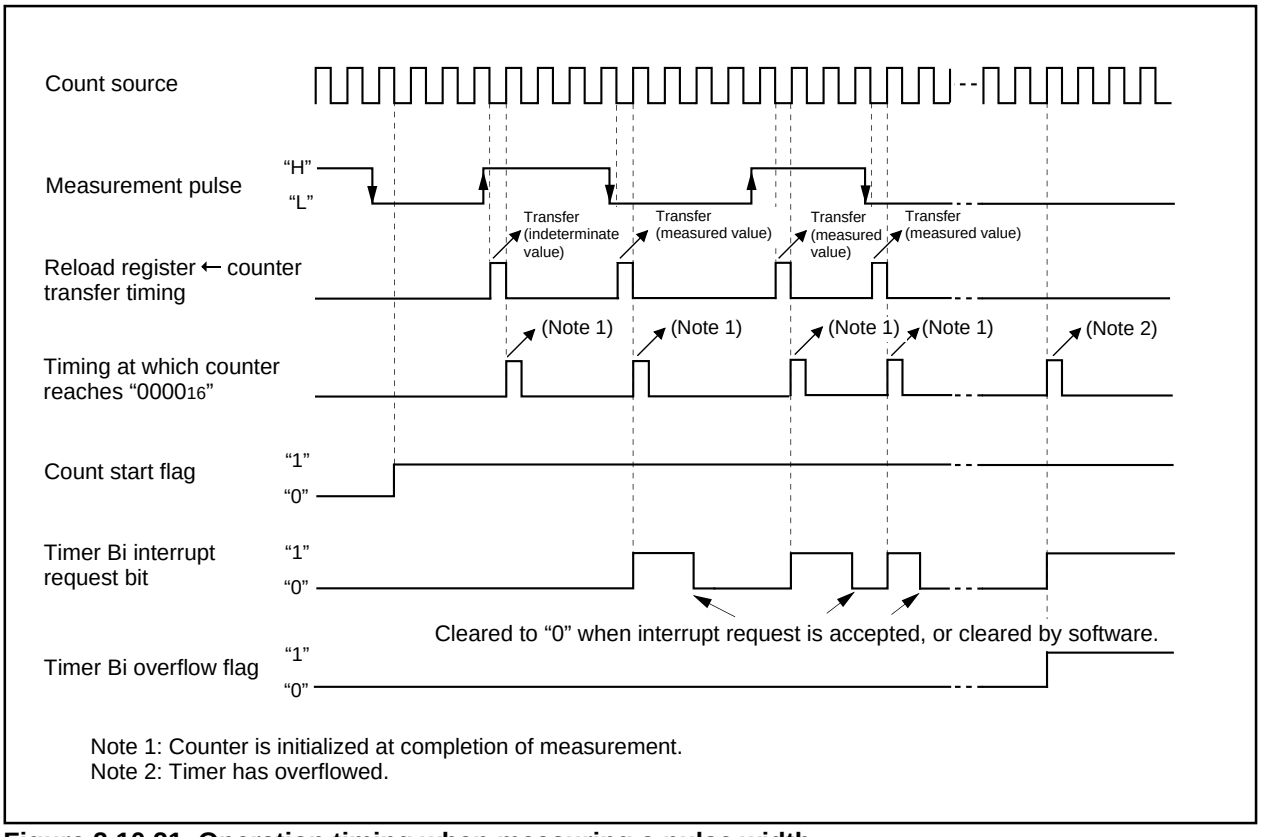

Figure 2.10.21 Operation timing when measuring a pulse width

2.11 Serial I/O

Serial I/O is configured as five channels: UART0, UART1, UART2, S I/O3 and S I/O4.

2.11.1 UART0 to 2

UART0, UART1 and UART2 each have an exclusive timer to generate a transfer clock, so they operate independently of each other.

Figure 2.11.1 shows the block diagram of UART0, UART1 and UART2. Figures 2.11.2 and 2.11.3 show the block diagram of the transmit/receive unit.

UARTi (i = 0 to 2) has two operation modes: a clock synchronous serial I/O mode and a clock asynchronous serial I/O mode (UART mode). The contents of the serial I/O mode select bits (bits 0 to 2 at addresses $03A0_{16}$, $03A8_{16}$ and 0378_{16}) determine whether UARTi is used as a clock synchronous serial I/O or as a UART. Although a few functions are different, UART0, UART1 and UART2 have almost the same functions.

UART0 through UART2 are almost equal in their functions with minor exceptions. UART2, in particular, is compliant with the SIM interface with some extra settings added in clock-asynchronous serial I/O mode (Note). It also has the bus collision detection function that generates an interrupt request if the TxD pin and the RxD pin are different in level.

Table 2.11.1 shows the comparison of functions of UART0 through UART2, and Figures 2.11.4 to 2.11.8 show the registers related to UARTi.

Note: SIM : Subscriber Identity Module

Table 2.11.1 Comparison of functions of UART0 through UART2

Function	UART0	UART1	UART2
CLK polarity selection	Possible (Note 1)	Possible (Note 1)	Possible (Note 1)
LSB first / MSB first selection	Possible (Note 1)	Possible (Note 1)	Possible (Note 2)
Continuous receive mode selection	Possible (Note 1)	Possible (Note 1)	Possible (Note 1)
Transfer clock output from multiple pins selection	Impossible	Possible (Note 1)	Impossible
Serial data logic switch	Impossible	Impossible	Possible (Note 4)
Sleep mode selection	Possible (Note 3)	Possible (Note 3)	Impossible
TxD, RxD I/O polarity switch	Impossible	Impossible	Possible
TxD, RxD port output format	CMOS output	CMOS output	N-channel open-drain output
Parity error signal output	Impossible	Impossible	Possible (Note 4)
Bus collision detection	Impossible	Impossible	Possible

Note 1: Only when clock synchronous serial I/O mode.
Note 2: Only when clock synchronous serial I/O mode and 8-bit UART mode.
Note 3: Only when UART mode.
Note 4: Using for SIM interface.

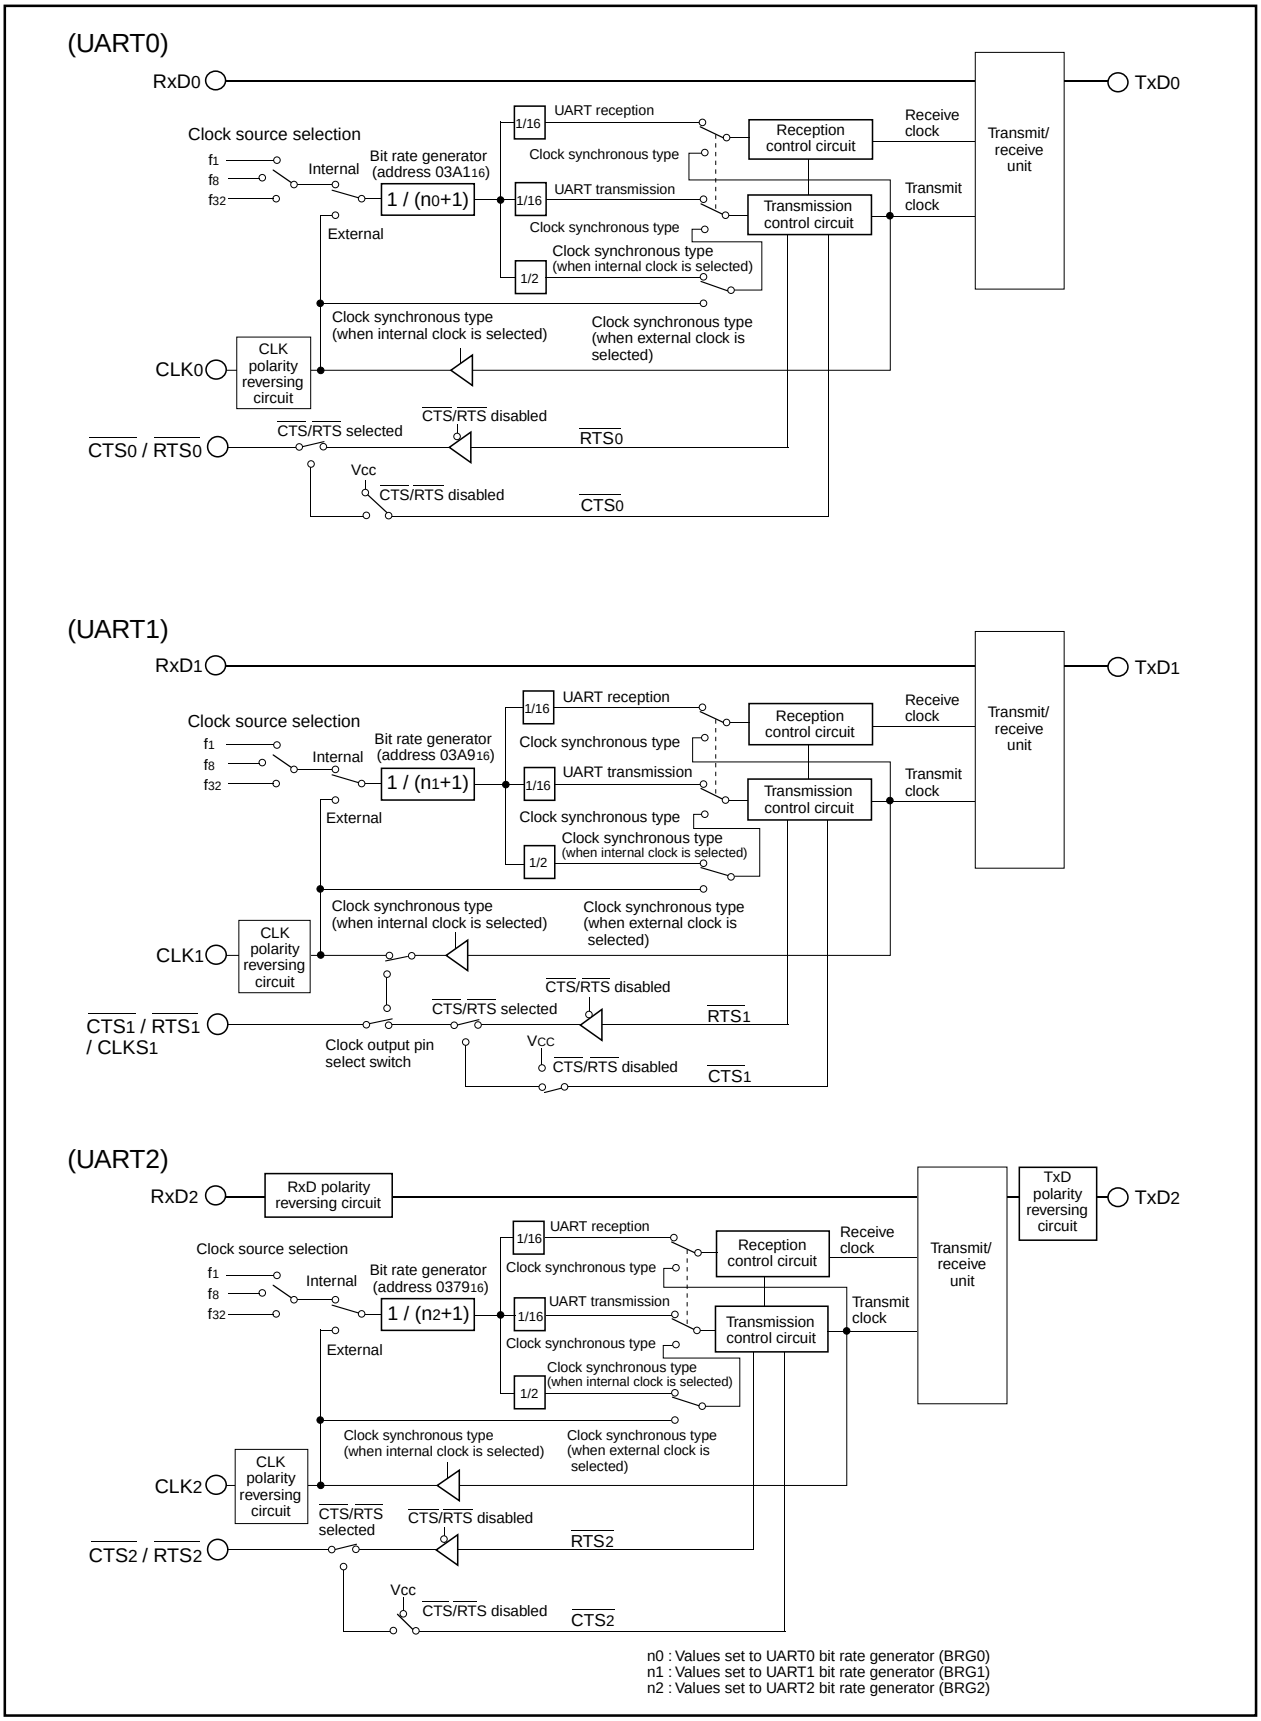

Figure 2.11.1 Block diagram of UARTi (i = 0 to 2)

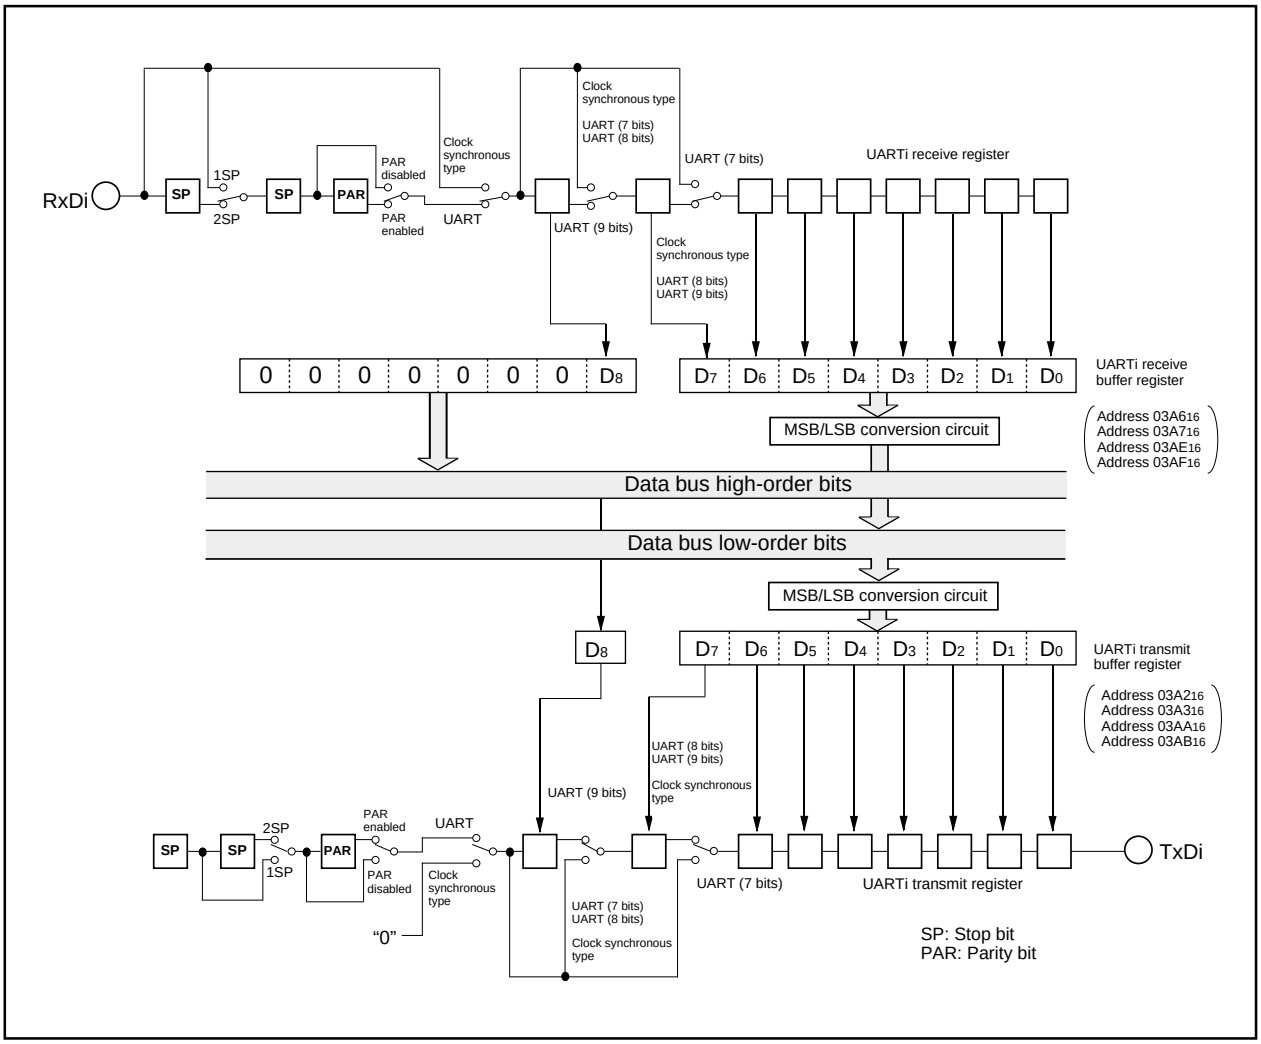

Figure 2.11.2 Block diagram of UARTi (i = 0, 1) transmit/receive unit

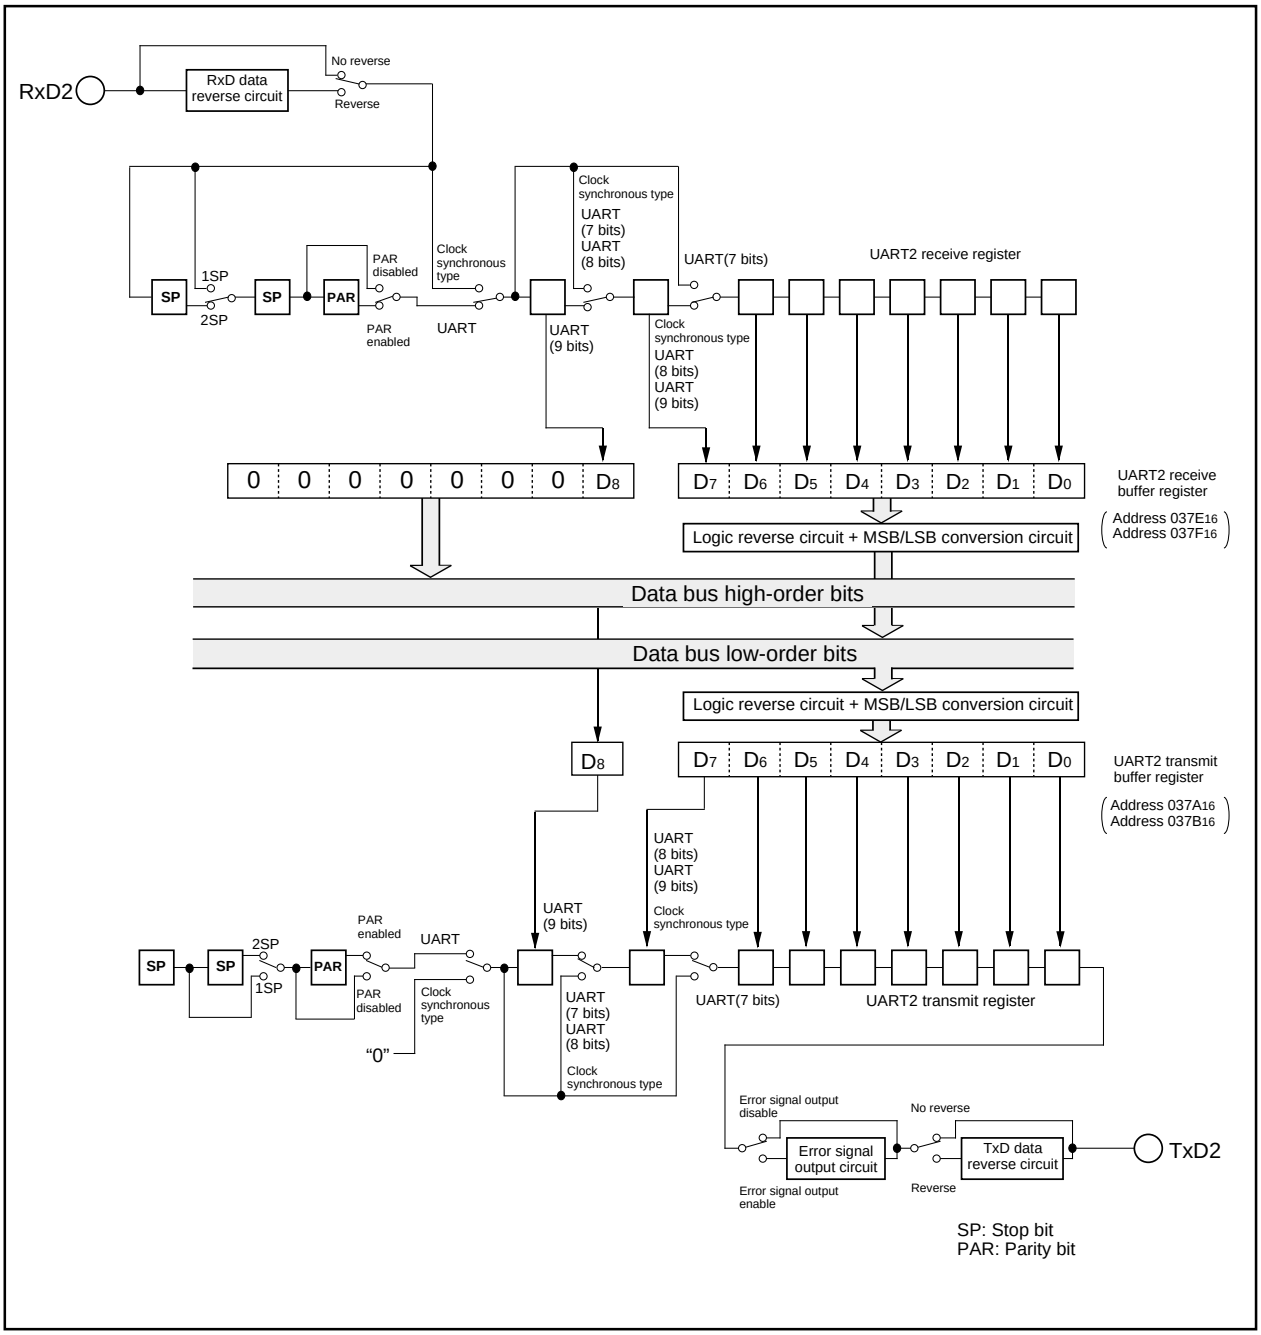

Figure 2.11.3 Block diagram of UART2 transmit/receive unit

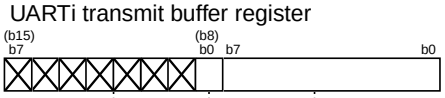
UARTi transmit buffer register

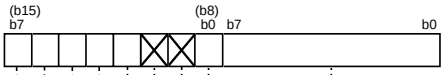


Symbol	Address	When reset
U0TB	$03A3_{16}$, $03A2_{16}$	Indeterminate
U1TB	$03AB_{16}$, $03AA_{16}$	Indeterminate
U2TB	$037B_{16}$, $037A_{16}$	Indeterminate

Function	R	W
Transmit data	×	○
Nothing is assigned. In an attempt to write to these bits, write "0". The value, if read, turn out to be indeterminate.	–	–

Note: Use MOV instruction to write this register.

UARTi receive buffer register



Symbol	Address	When reset
U0RB	$03A7_{16}$, $03A6_{16}$	Indeterminate
U1RB	$03AF_{16}$, $03AE_{16}$	Indeterminate
U2RB	$037F_{16}$, $037E_{16}$	Indeterminate

Bit symbol	Bit name	Function (During clock synchronous serial I/O mode)	Function (During UART mode)	R	W
—	———	Receive data	Receive data	○	×
Nothing is assigned. In an attempt to write to these bits, write "0". The value, if read, turns out to be "0".				–	–
ABT	Arbitration lost detecting flag (Note 2)	0 : Not detected 1 : Detected	Invalid	○	○
OER	Overrun error flag (Note 1)	0 : No overrun error 1 : Overrun error found	0 : No overrun error 1 : Overrun error found	○	×
FER	Framing error flag (Note 1)	Invalid	0 : No framing error 1 : Framing error found	○	×
PER	Parity error flag (Note 1)	Invalid	0 : No parity error 1 : Parity error found	○	×
SUM	Error sum flag (Note 1)	Invalid	0 : No error 1 : Error found	○	×

Note 1: Bits 15 through 12 are set to "0" when the serial I/O mode select bit (bits 2 to 0 at addresses $03A0_{16}$, $03A8_{16}$ and 0378_{16}) are set to "000_2" or the receive enable bit is set to "0".
(Bit 15 is set to "0" when bits 14 to 12 all are set to "0".) Bits 14 and 13 are also set to "0" when the lower byte of the UARTi receive buffer register (addresses $03A6_{16}$, $03AE_{16}$ and $037E_{16}$) is read out.
Note 2: Arbitration lost detecting flag is allocated to U2RB and noting but "0" may be written. Nothing is assigned in bit 11 of U0RB and U1RB. These bits can neither be set or reset. When read, the value of this bit is "0".

UARTi bit rate generator

Symbol	Address	When reset
U0BRG	$03A1_{16}$	Indeterminate
U1BRG	$03A9_{16}$	Indeterminate
U2BRG	0379_{16}	Indeterminate

Function	Values that can be set	R	W
Assuming that set value = n, BRGi divides the count source by n + 1	00_{16} to FF_{16}	×	○

Note 1: Write a value to the register while transmit/receive stop.
Note 2: Use MOV instruction to write to this register.

U2ERE	Error signal output enable bit	Must be fixed to “0”	0 : Output disabled 1 : Output enabled	○	○

Figure 2.11.7 UARTi I/O-related registers (4)

UART transmit/receive control register 2

Symbol: UCON — Address: $03B0_{16}$ — When reset: $X0000000_2$

Bit symbol	Bit name	Function (During clock synchronous serial I/O mode)	Function (During UART mode)	R	W
U0IRS	UART0 transmit interrupt cause select bit	0 : Transmit buffer empty (TI = 1) 1 : Transmission completed (TXEPT = 1)	0 : Transmit buffer empty (TI = 1) 1 : Transmission completed (TXEPT = 1)	O	O
U1IRS	UART1 transmit interrupt cause select bit	0 : Transmit buffer empty (TI = 1) 1 : Transmission completed (TXEPT = 1)	0 : Transmit buffer empty (TI = 1) 1 : Transmission completed (TXEPT = 1)	O	O
U0RRM	UART0 continuous receive mode enable bit	0 : Continuous receive mode disabled 1 : Continuous receive mode enable	Invalid	O	O
U1RRM	UART1 continuous receive mode enable bit	0 : Continuous receive mode disabled 1 : Continuous receive mode enabled	Invalid	O	O
CLKMD0	CLK/CLKS select bit 0	Valid when bit 5 = "1" 0 : Clock output to CLK1 1 : Clock output to CLKS1	Invalid	O	O
CLKMD1	CLK/CLKS select bit 1 (Note)	0 : Normal mode (CLK output is CLK1 only) 1 : Transfer clock output from multiple pins function selected	Must always be "0"	O	O
Reserved bit		Must always be "0"		O	O
Nothing is assigned. In an attempt to write to this bit, write "0". The value, if read, turns out to be indeterminate.				–	–

Note: When using multiple pins to output the transfer clock, the following requirements must be met:
• UART1 internal/external clock select bit (bit 3 at address $03A8_{16}$) = "0".

UART2 special mode register

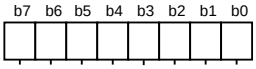
Symbol: U2SMR — Address: 0377_{16} — When reset: 00_{16}

Bit symbol	Bit name	Function (During clock synchronous serial I/O mode)	Function (During UART mode)	R	W
IICM	I^2C mode selection bit	0 : Normal mode 1 : I^2C mode	Must always be "0"	O	O
ABC	Arbitration lost detecting flag control bit	0 : Update per bit 1 : Update per byte	Must always be "0"	O	O
BBS	Bus busy flag	0 : STOP condition detected 1 : START condition detected	Must always be "0"	O	O (Note 1)
LSYN	SCLL sync output enable bit	0 : Disabled 1 : Enabled	Must always be "0"	O	O
ABSCS	Bus collision detect sampling clock select bit	Must always be "0"	0 : Rising edge of transfer clock 1 : Underflow signal of timer A0	O	O
ACSE	Auto clear function select bit of transmit enable bit	Must always be "0"	0 : No auto clear function 1 : Auto clear at occurrence of bus collision	O	O
SSS	Transmit start condition select bit	Must always be "0"	0 : Ordinary 1 : Falling edge of RxD2	O	O
SDDS	SDA digital delay selection bit (Notes 2 and 3)	0 : Analog delay output selection 1 : Digital delay output selection	Must always be "0"	O	O

Notes 1: Nothing but "0" may be written.
2: Do not write "1" except at I^2C mode. Must always be "0" at normal mode.
Bit 7 to bit5 (DL2 to DL0 = SDA digital delay value setting bit) of UART2 special mode register 3 (U2SMR3/address 0375_{16}) are initialized and become "000" when this bit is "0", analog delay circuit is selected. Reading and writing U2SMR3 are enablewhen SDDS = "0".
3: Delaying ; Only analog delay value when analog delay is selected, and only digital delay value when digital delay is selected.

Figure 2.11.8 UARTi I/O-related registers (5)

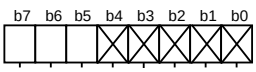
UART2 special mode register 2 (I^2C bus exclusive register)



Symbol U2SMR2 | Address 037616 | When reset 0016

Bit symbol	Bit name	Function	R	W
IICM2	I^2C mode selection bit 2	Refer to Table 2.11.11	○	○
CSC	Clock-synchronous bit	0 : Disabled 1 : Enabled	○	○
SWC	SCL wait output bit	0 : Disabled 1 : Enabled	○	○
ALS	SDA output stop bit	0 : Disabled 1 : Enabled	○	○
STAC	UART2 initialization bit	0 : Disabled 1 : Enabled	○	○
SWC2	SCL wait output bit 2	0: UART2 clock 1: 0 output	○	○
SDHI	SDA output disable bit	0: Enabled 1: Disabled (high impedance)	○	○
SHTC	Start/stop condition control bit	Set this bit to "1" in I^2C mode (refer to Table 2.11.12)	○	○

UART2 special mode register 3 (I^2C bus exclusive register)



Symbol U2SMR3 | Address 037516 | When reset Indeterminate
(initializing value is "0016" at SDDS = "1")

Bit symbol	Bit name	Function (I^2C bus exclusive)	R	W
Nothing is assigned. In an attempt to write to this bit, write "0". The value, if read, turns out to be "0". "0" is read out when SDDS = 1. (Note1)			—	—
DL0	SDA digital delay value setting bit (Note1, Note2, Note3, Note4)	b7 b6 b5 0 0 0 : Analog delay 0 0 1 : 1–2 cycle of 1/f (Xin)(Digital delay) 0 1 0 : 2–3 cycle of 1/f (Xin)(Digital delay) 0 1 1 : 3–4 cycle of 1/f (Xin)(Digital delay) 1 0 0 : 4–5 cycle of 1/f (Xin)(Digital delay) 1 0 1 : 5–6 cycle of 1/f (Xin)(Digital delay) 1 1 0 : 6–7 cycle of 1/f (Xin)(Digital delay) 1 1 1 : 7–8 cycle of 1/f (Xin)(Digital delay)	○	○
DL1			○	○
DL2			○	○

Notes 1: Reading and writing is possible when bit7 (SDDS = SDA digital delay selection bit) of UART2 special mode register (U2SMR/address 037716) is "1". When set SDDS = "1" and read out initialized value of UART2 special mode register 3(U2SMR3), this value is "0016".When set SDDS = "1" and write to UART2 special mode register 3(U2SMR3), set "0" to bit 0 to bit 4. When SDDS = "0", writing is enable. When read out, this value is indeterminate.
2: When SDDS = "0" , this bit is initialized and become "000", selected analog delay circuit. This bit is become "000" after end reset released, and selected analog delay circuit. Reading out is possible when only SDDS = "1". when SDDS = "0", value which was read out is indeterminate.
3: Delaying ; Only analog delay value when analog delay is selected, and only digital delay value when digital delay is selected.
4: Delay level depends on SCL pin and SDA pin. And, when use external clock, delay is increase around 100ns. So test first, and use this.

Figure 2.11.9 UARTi -related registers (6)

2.11.2 Clock synchronous serial I/O mode

The clock synchronous serial I/O mode uses a transfer clock to transmit and receive data. Tables 2.11.2 and 2.11.3 list the specifications of the clock synchronous serial I/O mode. Figur 2.11.10 shows the UARTi transmit/receive mode register.

Table 2.11.2 Specifications of clock synchronous serial I/O mode (1)

Item	Specification
Transfer data format	• Transfer data length: 8 bits
Transfer clock	• When internal clock is selected (bit 3 at addresses 03A0$_{16}$, 03A8$_{16}$, 0378$_{16}$ = “0”) : fi/ 2(n+1) (Note 1) fi = f1, f8, f32 • When external clock is selected (bit 3 at addresses 03A0$_{16}$, 03A8$_{16}$, 0378$_{16}$ = “1”) : Input from CLKi pin
Transmission/reception control	• $\overline{\text{CTS}}$ function/$\overline{\text{RTS}}$ function/$\overline{\text{CTS}}$, $\overline{\text{RTS}}$ function chosen to be invalid
Transmission start condition	• To start transmission, the following requirements must be met: – Transmit enable bit (bit 0 at addresses 03A5$_{16}$, 03AD$_{16}$, 037D$_{16}$) = “1” – Transmit buffer empty flag (bit 1 at addresses 03A5$_{16}$, 03AD$_{16}$, 037D$_{16}$) = “0” – When $\overline{\text{CTS}}$ function selected, $\overline{\text{CTS}}$ input level = “L” • Furthermore, if external clock is selected, the following requirements must also be met: – CLKi polarity select bit (bit 6 at addresses 03A4$_{16}$, 03AC$_{16}$, 037C$_{16}$) = “0”: CLKi input level = “H” – CLKi polarity select bit (bit 6 at addresses 03A4$_{16}$, 03AC$_{16}$, 037C$_{16}$) = “1”: CLKi input level = “L”
Reception start condition	• To start reception, the following requirements must be met: – Receive enable bit (bit 2 at addresses 03A5$_{16}$, 03AD$_{16}$, 037D$_{16}$) = “1” – Transmit enable bit (bit 0 at addresses 03A5$_{16}$, 03AD$_{16}$, 037D$_{16}$) = “1” – Transmit buffer empty flag (bit 1 at addresses 03A5$_{16}$, 03AD$_{16}$, 037D$_{16}$) = “0” • Furthermore, if external clock is selected, the following requirements must also be met: – CLKi polarity select bit (bit 6 at addresses 03A4$_{16}$, 03AC$_{16}$, 037C$_{16}$) = “0”: CLKi input level = “H” – CLKi polarity select bit (bit 6 at addresses 03A4$_{16}$, 03AC$_{16}$, 037C$_{16}$) = “1”: CLKi input level = “L”
Interrupt request generation timing	• When transmitting – Transmit interrupt cause select bit (bits 0, 1 at address 03B0$_{16}$, bit 4 at address 037D$_{16}$) = “0”: Interrupts requested when data transfer from UARTi transfer buffer register to UARTi transmit register is completed – Transmit interrupt cause select bit (bits 0, 1 at address 03B0$_{16}$, bit 4 at address 037D$_{16}$) = “1”: Interrupts requested when data transmission from UARTi transfer register is completed • When receiving – Interrupts requested when data transfer from UARTi receive register to UARTi receive buffer register is completed
Error detection	• Overrun error (Note 2) This error occurs when the next data is ready before contents of UARTi receive buffer register are read out

Note 1: “n” denotes the value 00$_{16}$ to FF$_{16}$ that is set to the UART bit rate generator.
Note 2: If an overrun error occurs, the UARTi receive buffer will have the next data written in. Note also that the UARTi receive interrupt request bit does not change.

Table 2.11.3 Specifications of clock synchronous serial I/O mode (2)

Item	Specification
Select function	• CLK polarity selection Whether transmit data is output/input at the rising edge or falling edge of the transfer clock can be selected • LSB first/MSB first selection Whether transmission/reception begins with bit 0 or bit 7 can be selected • Continuous receive mode selection Reception is enabled simultaneously by a read from the receive buffer register • Transfer clock output from multiple pins selection (UART1) UART1 transfer clock can be chosen by software to be output from one of the two pins set • Switching serial data logic (UART2) Whether to reverse data in writing to the transmission buffer register or reading the reception buffer register can be selected. • TxD, RxD I/O polarity reverse (UART2) This function is reversing TxD port output and RxD port input. All I/O data level is reversed.

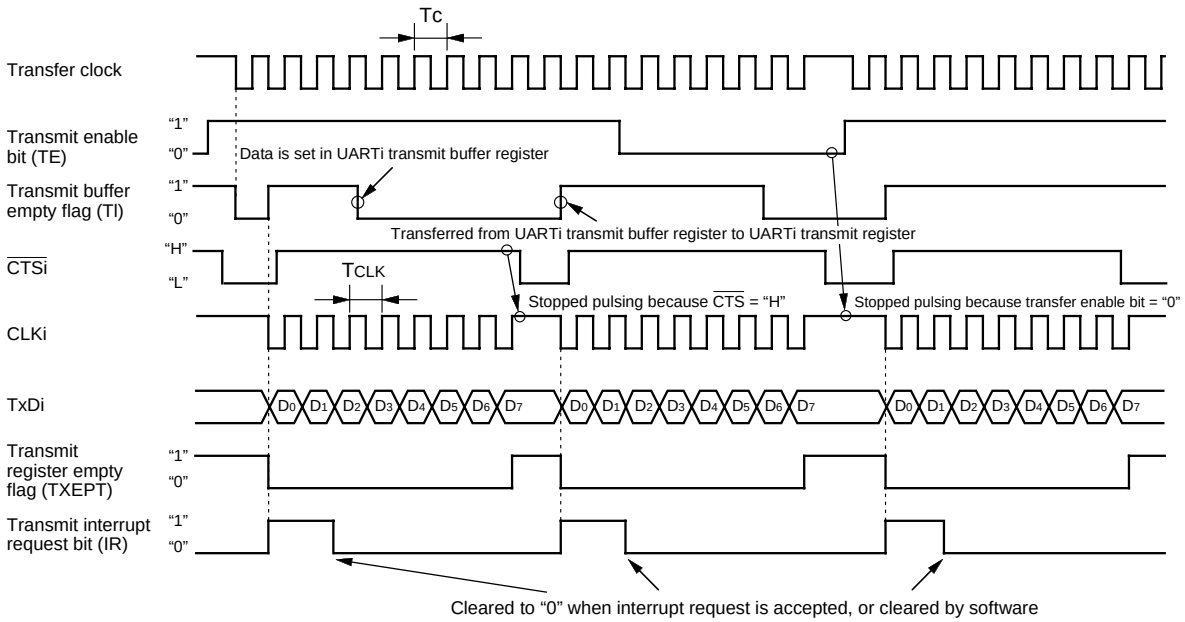
Figure 2.11.10 UARTi transmit/receive mode register in clock synchronous serial I/O mode

Table 2.11.4 lists the functions of the input/output pins during clock synchronous serial I/O mode. Note that for a period from when the UARTi operation mode is selected to when transfer starts, the TxDi pin outputs a “H”. (If the N-channel open-drain is selected, this pin is in floating state.)

Table 2.11.4 Input/output pin functions in clock synchronous serial I/O mode

Pin name	Function	Method of selection
TxDi ($P6_3$, $P6_7$, $P7_0$)	Serial data output	(Outputs dummy data when performing reception only)
RxDi ($P6_2$, $P6_6$, $P7_1$)	Serial data input	Port $P6_2$, $P6_6$ and $P7_1$ direction register (bits 2 and 6 at address $03EE_{16}$, bit 1 at address $03EF_{16}$)= “0” (Can be used as an input port when performing transmission only)
CLKi ($P6_1$, $P6_5$, $P7_2$)	Transfer clock output	Internal/external clock select bit (bit 3 at address $03A0_{16}$, $03A8_{16}$, 0378_{16}) = “0”
	Transfer clock input	Internal/external clock select bit (bit 3 at address $03A0_{16}$, $03A8_{16}$, 0378_{16}) = “1” Port $P6_1$, $P6_5$ and $P7_2$ direction register (bits 1 and 5 at address $03EE_{16}$, bit 2 at address $03EF_{16}$) = “0”
$\overline{CTS}i/\overline{RTS}i$ ($P6_0$, $P6_4$, $P7_3$)	$\overline{CTS}$ input	$\overline{CTS}/\overline{RTS}$ disable bit (bit 4 at address $03A4_{16}$, $03AC_{16}$, $037C_{16}$) =“0” $\overline{CTS}/\overline{RTS}$ function select bit (bit 2 at address $03A4_{16}$, $03AC_{16}$, $037C_{16}$) = “0” Port $P6_0$, $P6_4$ and $P7_3$ direction register (bits 0 and 4 at address $03EE_{16}$, bit 3 at address $03EF_{16}$) = “0”
	$\overline{RTS}$ output	$\overline{CTS}/\overline{RTS}$ disable bit (bit 4 at address $03A4_{16}$, $03AC_{16}$, $037C_{16}$) = “0” $\overline{CTS}/\overline{RTS}$ function select bit (bit 2 at address $03A4_{16}$, $03AC_{16}$, $037C_{16}$) = “1”
	Programmable I/O port	$\overline{CTS}/\overline{RTS}$ disable bit (bit 4 at address $03A4_{16}$, $03AC_{16}$, $037C_{16}$) = “1”

• Example of transmit timing (when internal clock is selected)

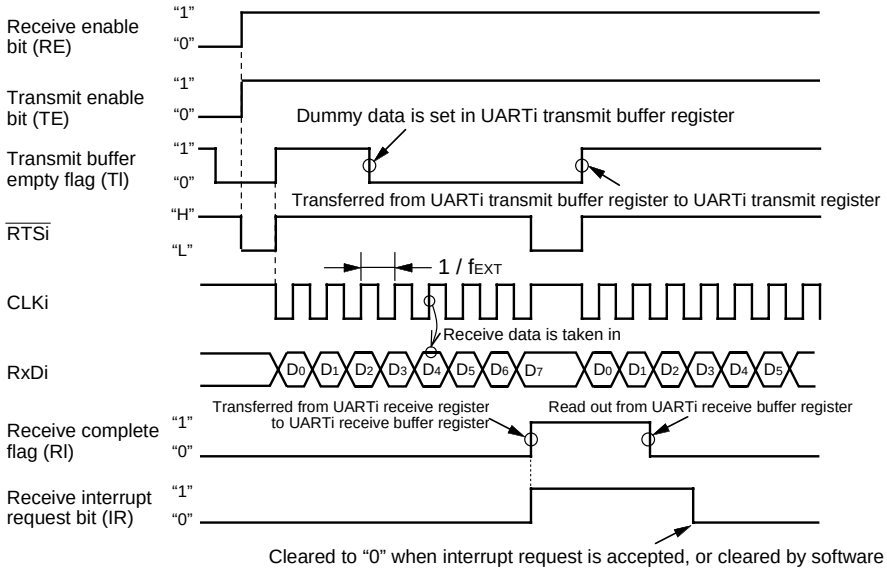


Shown in ( ) are bit symbols.

The above timing applies to the following settings:
- Internal clock is selected.
- CTS function is selected.
- CLK polarity select bit = "0".
- Transmit interrupt cause select bit = "0".

Tc = TCLK = 2(n + 1) / fi
fi: frequency of BRGi count source (f1, f8, f32)
n: value set to BRGi

• Example of receive timing (when external clock is selected)



Shown in ( ) are bit symbols.

The above timing applies to the following settings:

Meet the following conditions are met when the CLK

Figure 2.11.11 Typical transmit/receive timings in clock synchronous serial I/O mode

(1) Polarity select function

As shown in Figure 2.11.12 the CLK polarity select bit (bit 6 at addresses 03A4$_{16}$, 03AC$_{16}$, 037C$_{16}$) allows selection of the polarity of the transfer clock.

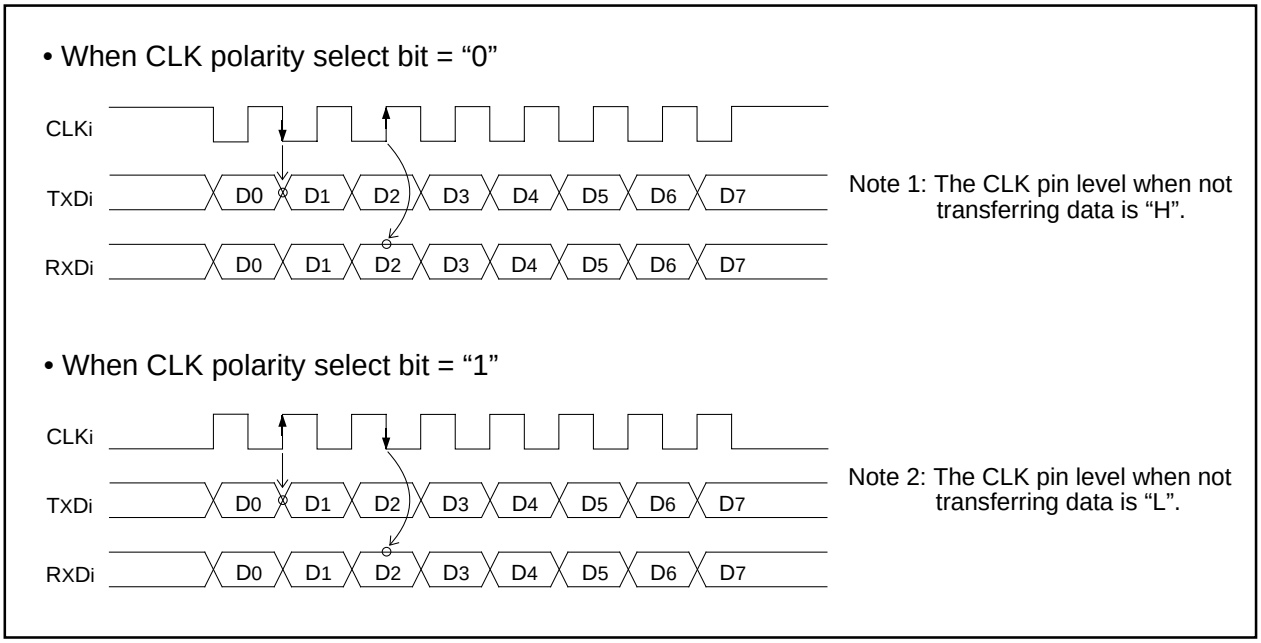


Figure 2.11.12 Polarity of transfer clock

(2) LSB first/MSB first select function

As shown in Figure 2.11.13, when the transfer format select bit (bit 7 at addresses 03A4$_{16}$, 03AC$_{16}$, 037C$_{16}$) = “0”, the transfer format is “LSB first”; when the bit = “1”, the transfer format is “MSB first”.

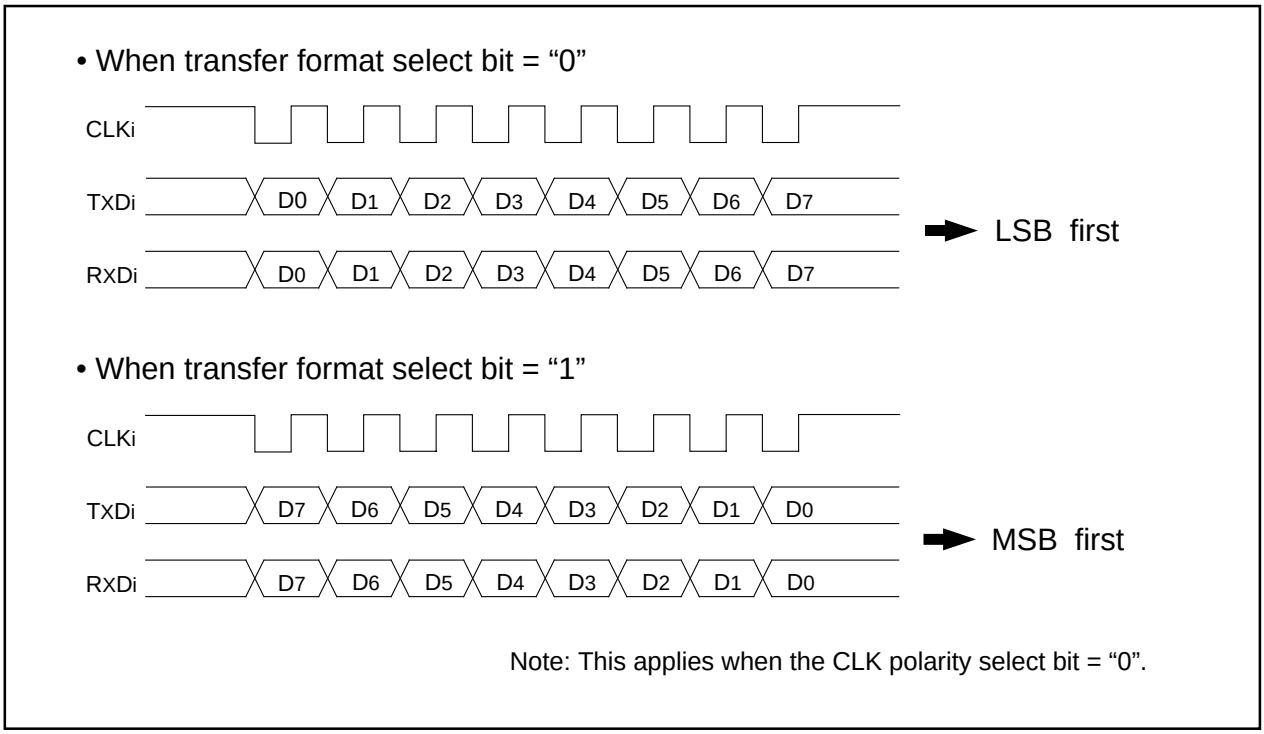

Figure 2.11.13 Transfer format

(3) Transfer clock output from multiple pins function (UART1)

This function allows the setting two transfer clock output pins and choosing one of the two to output a clock by using the CLK and CLKS select bit (bits 4 and 5 at address 03B0$_{16}$). (See Figure 2.11.14) The multiple pins function is valid only when the internal clock is selected for UART1.

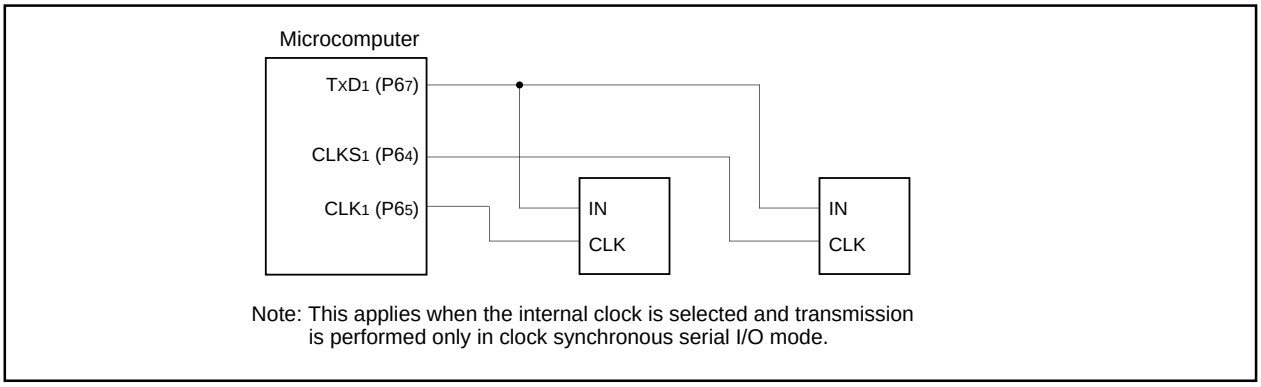

Figure 2.11.14 The transfer clock output from the multiple pins function usage

(4) Continuous receive mode

If the continuous receive mode enable bit (bits 2 and 3 at address 03B0$_{16}$, bit 5 at address 037D$_{16}$) is set to "1", the unit is placed in continuous receive mode. In this mode, when the receive buffer register is read out, the unit simultaneously goes to a receive enable state without having to set dummy data to the transmit buffer register back again.

(5) Serial data logic switch function (UART2)

When the data logic select bit (bit6 at address 037D$_{16}$) = "1", and writing to transmit buffer register or reading from receive buffer register, data is reversed. Figure 2.11.15 shows the example of serial data logic switch timing.

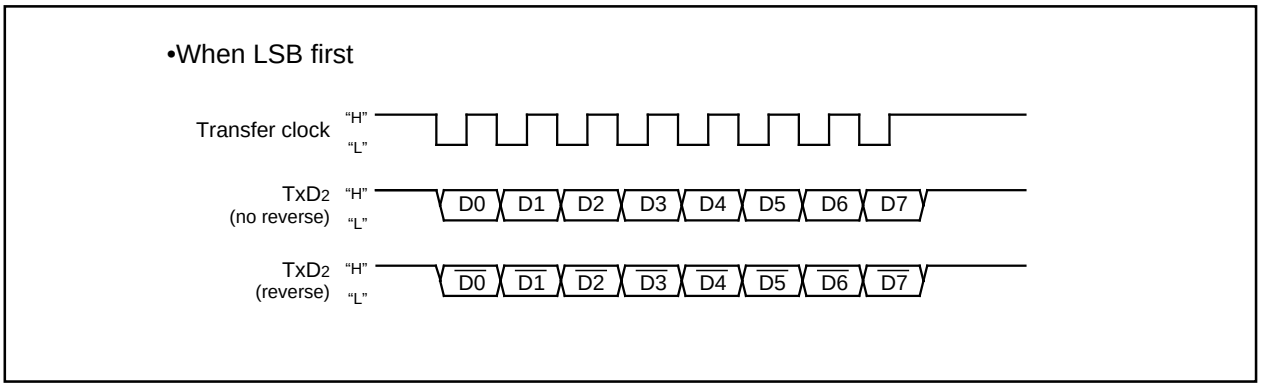

Figure 2.11.15 Serial data logic switch timing

2.11.3 Clock asynchronous serial I/O (UART) mode

The UART mode allows transmitting and receiving data after setting the desired transfer rate and transfer data format. Tables 2.11.5 and 2.11.6 list the specifications of the UART mode. Figure 2.11.16 shows the UARTi transmit/receive mode register.

Table 2.11.5 Specifications of UART Mode (1)

Item	Specification
Transfer data format	• Character bit (transfer data): 7 bits, 8 bits, or 9 bits as selected • Start bit: 1 bit • Parity bit: Odd, even, or nothing as selected • Stop bit: 1 bit or 2 bits as selected
Transfer clock	• When internal clock is selected (bit 3 at addresses $03A0_{16}$,$03A8_{16}$,0378_{16} = "0") : fi/16(n+1) (Note 1) fi = f_1, f_8, f_{32} • When external clock is selected (bit 3 at addresses $03A0_{16}$ and $03A8_{16}$ = "1") : f_{EXT}/16(n+1) (Note 1) (Note 2) (Do not set external clock for UART2)
Transmission/reception control	• $\overline{CTS}$ function/$\overline{RTS}$ function/$\overline{CTS}$, $\overline{RTS}$ function chosen to be invalid
Transmission start condition	• To start transmission, the following requirements must be met: - Transmit enable bit (bit 0 at addresses $03A5_{16}$, $03AD_{16}$, $037D_{16}$) = "1" - Transmit buffer empty flag (bit 1 at addresses $03A5_{16}$, $03AD_{16}$, $037D_{16}$) = "0" - When $\overline{CTS}$ function selected, $\overline{CTS}$ input level = "L"
Reception start condition	• To start reception, the following requirements must be met: - Receive enable bit (bit 2 at addresses $03A5_{16}$, $03AD_{16}$, $037D_{16}$) = "1" - Start bit detection
Interrupt request generation timing	• When transmitting - Transmit interrupt cause select bits (bits 0,1 at address $03B0_{16}$, bit4 at address $037D_{16}$) = "0": Interrupts requested when data transfer from UARTi transfer buffer register to UARTi transmit register is completed - Transmit interrupt cause select bits (bits 0, 1 at address $03B0_{16}$, bit4 at address $037D_{16}$) = "1": Interrupts requested when data transmission from UARTi transfer register is completed • When receiving - Interrupts requested when data transfer from UARTi receive register to UARTi receive buffer register is completed
Error detection	• Overrun error (Note 3) This error occurs when the next data is ready before contents of UARTi receive buffer register are read out • Framing error This error occurs when the number of stop bits set is not detected • Parity error This error occurs when if parity is enabled, the number of 1's in parity and character bits does not match the number of 1's set • Error sum flag This flag is set (= 1) when any of the overrun, framing, and parity errors is encountered

Note 1: 'n' denotes the value 00_{16} to FF_{16} that is set to the UARTi bit rate generator.
Note 2: f_{EXT} is input from the CLKi pin.
Note 3: If an overrun error occurs, the UARTi receive buffer will have the next data written in. Note also that the UARTi receive interrupt request bit does not change.

Table 2.11.6 Specifications of UART Mode (2)

Item	Specification
Select function	• Sleep mode selection (UART0, UART1) This mode is used to transfer data to and from one of multiple slave microcomputers • Serial data logic switch (UART2) This function is reversing logic value of transferring data. Start bit, parity bit and stop bit are not reversed. • TxD, RxD I/O polarity switch (UART2) This function is reversing TxD port output and RxD port input. All I/O data level is reversed.

UARTi transmit / receive mode registers

Note: Usually set to “0”.

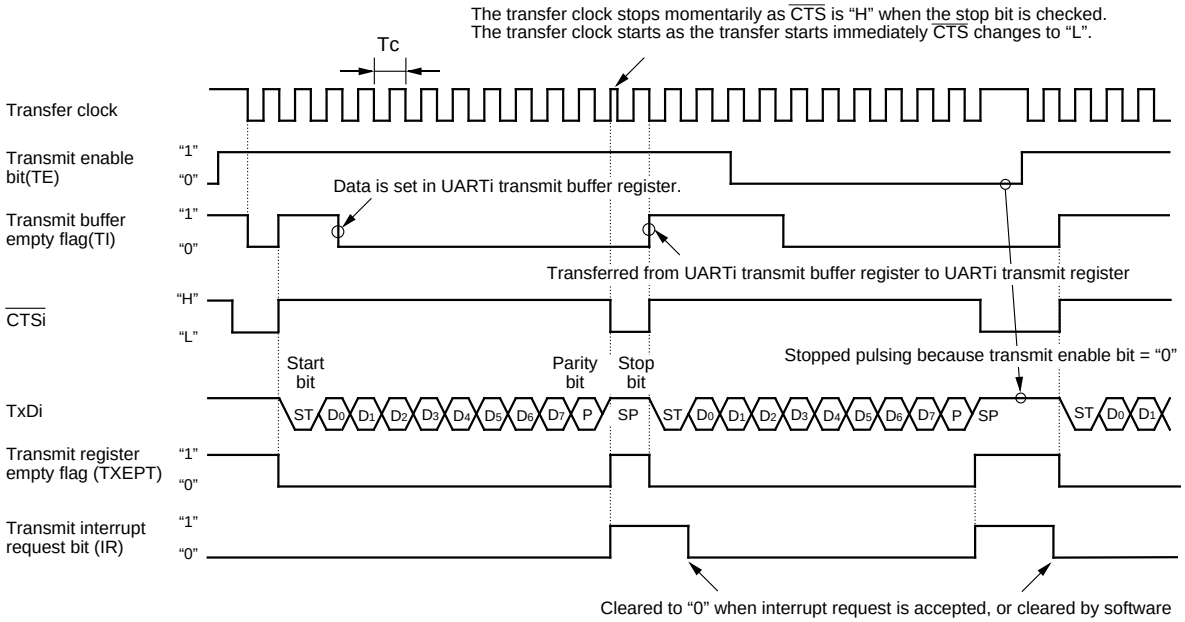
Figure 2.11.16 UARTi transmit/receive mode register in UART mode

Table 2.11.7 lists the functions of the input/output pins during UART mode. Note that for a period from when the UARTi operation mode is selected to when transfer starts, the TxDi pin outputs a “H”. (If the N-channel open-drain is selected, this pin is in floating state.)

Table 2.11.7 Input/output pin functions in UART mode

Pin name	Function	Method of selection
TxDi ($P6_3$, $P6_7$, $P7_0$)	Serial data output	
RxDi ($P6_2$, $P6_6$, $P7_1$)	Serial data input	Port $P6_2$, $P6_6$ and $P7_1$ direction register (bits 2 and 6 at address $03EE_{16}$, bit 1 at address $03EF_{16}$)= “0” (Can be used as an input port when performing transmission only)
CLKi ($P6_1$, $P6_5$, $P7_2$)	Programmable I/O port	Internal/external clock select bit (bit 3 at address $03A0_{16}$, $03A8_{16}$, 0378_{16}) = “0”
	Transfer clock input	Internal/external clock select bit (bit 3 at address $03A0_{16}$, $03A8_{16}$) = “1” Port $P6_1$, $P6_5$ direction register (bits 1 and 5 at address $03EE_{16}$) = “0” (Do not set external clock for UART2)
$\overline{CTS}i/\overline{RTS}i$ ($P6_0$, $P6_4$, $P7_3$)	$\overline{CTS}$ input	$\overline{CTS}/\overline{RTS}$ disable bit (bit 4 at address $03A4_{16}$, $03AC_{16}$, $037C_{16}$) =“0” $\overline{CTS}/\overline{RTS}$ function select bit (bit 2 at address $03A4_{16}$, $03AC_{16}$, $037C_{16}$) = “0” Port $P6_0$, $P6_4$ and $P7_3$ direction register (bits 0 and 4 at address $03EE_{16}$, bit 3 at address $03EF_{16}$) = “0”
	$\overline{RTS}$ output	$\overline{CTS}/\overline{RTS}$ disable bit (bit 4 at address $03A4_{16}$, $03AC_{16}$, $037C_{16}$) = “0” $\overline{CTS}/\overline{RTS}$ function select bit (bit 2 at address $03A4_{16}$, $03AC_{16}$, $037C_{16}$) = “1”
	Programmable I/O port	$\overline{CTS}/\overline{RTS}$ disable bit (bit 4 at address $03A4_{16}$, $03AC_{16}$, $037C_{16}$) = “1”

• Example of transmit timing when transfer data is 8 bits long (parity enabled, one stop bit)

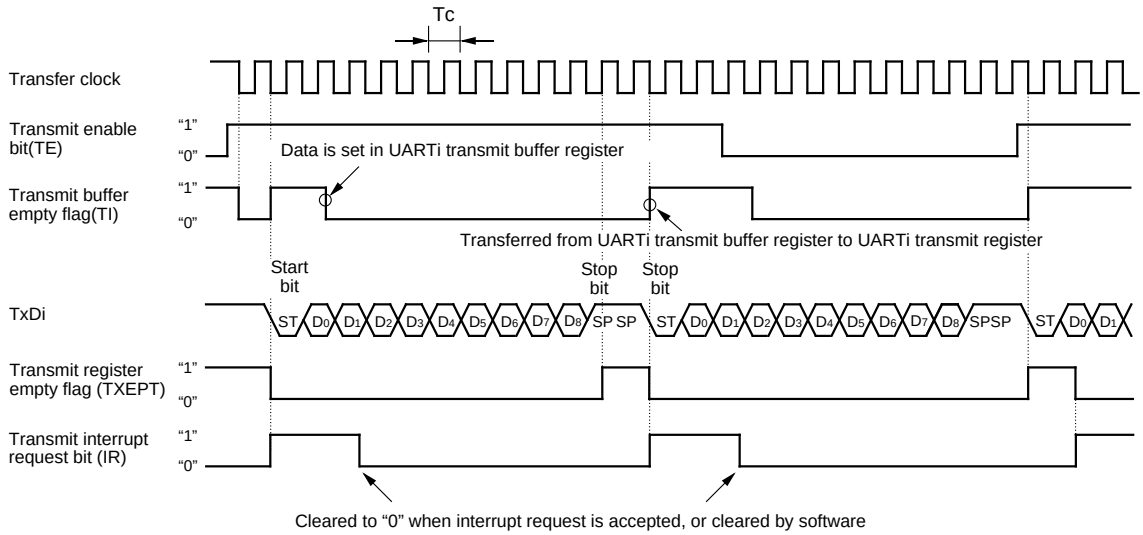


Shown in ( ) are bit symbols.

The above timing applies to the following settings :
- Parity is enabled.
- One stop bit.
- CTS function is selected.
- Transmit interrupt cause select bit = "1".

Tc = 16 (n + 1) / fi or 16 (n + 1) / fEXT
fi : frequency of BRGi count source (f1, f8, f32)
fEXT : frequency of BRGi count source (external clock)
n : value set to BRGi

• Example of transmit timing when transfer data is 9 bits long (parity disabled, two stop bits)



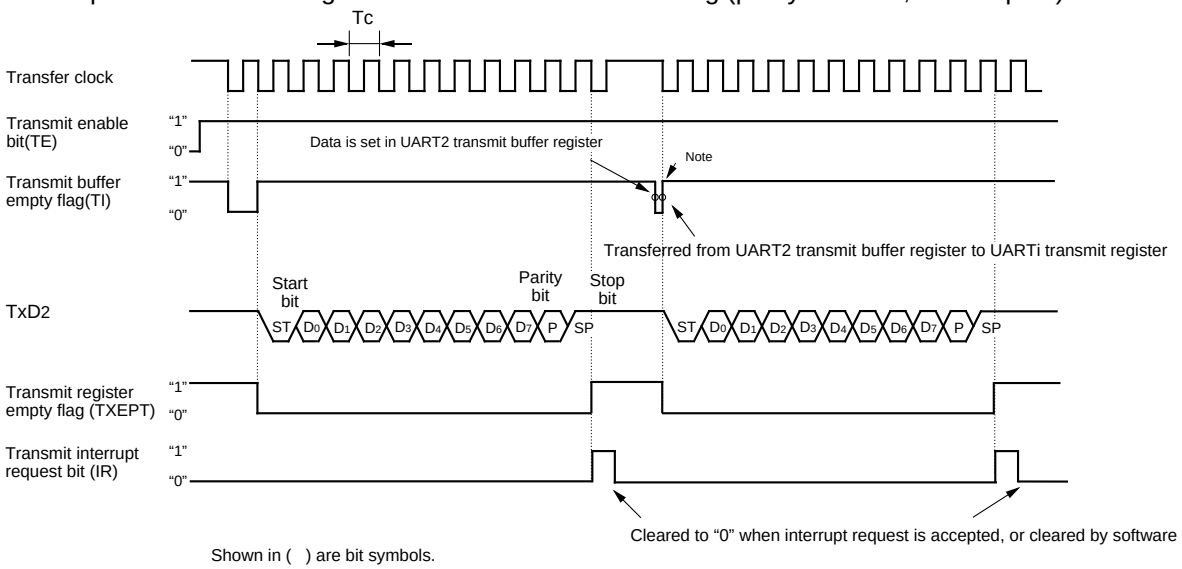
Shown in ( ) are bit symbols.

The above timing applies to the following settings :
- Parity is disabled.
- Two stop bits.
- CTS function is disabled.
- Transmit interrupt cause select bit = "0".

Tc = 16 (n + 1) / fi or 16 (n + 1) / fEXT
fi : frequency of BRGi count source (f1, f8, f32)
fEXT : frequency of BRGi count source (external clock)
n : value set to BRGi

Figure 2.11.17 Typical transmit timings in UART mode(UART0,UART1)

• Example of transmit timing when transfer data is 8 bits long (parity enabled, one stop bit)



Shown in ( ) are bit symbols.

The above timing applies to the following settings :
- Parity is enabled.
- One stop bit.
- Transmit interrupt cause select bit = "1".

Tc = 16 (n + 1) / fi
fi : frequency of BRG2 count source (f_1, f_8, f_{32})
n : value set to BRG2

Note: The transmit is started with overflow timing of BRG after having written in a value at the transmit buffer in the above timing.

Figure 2.11.18 Typical transmit timings in UART mode(UART2)

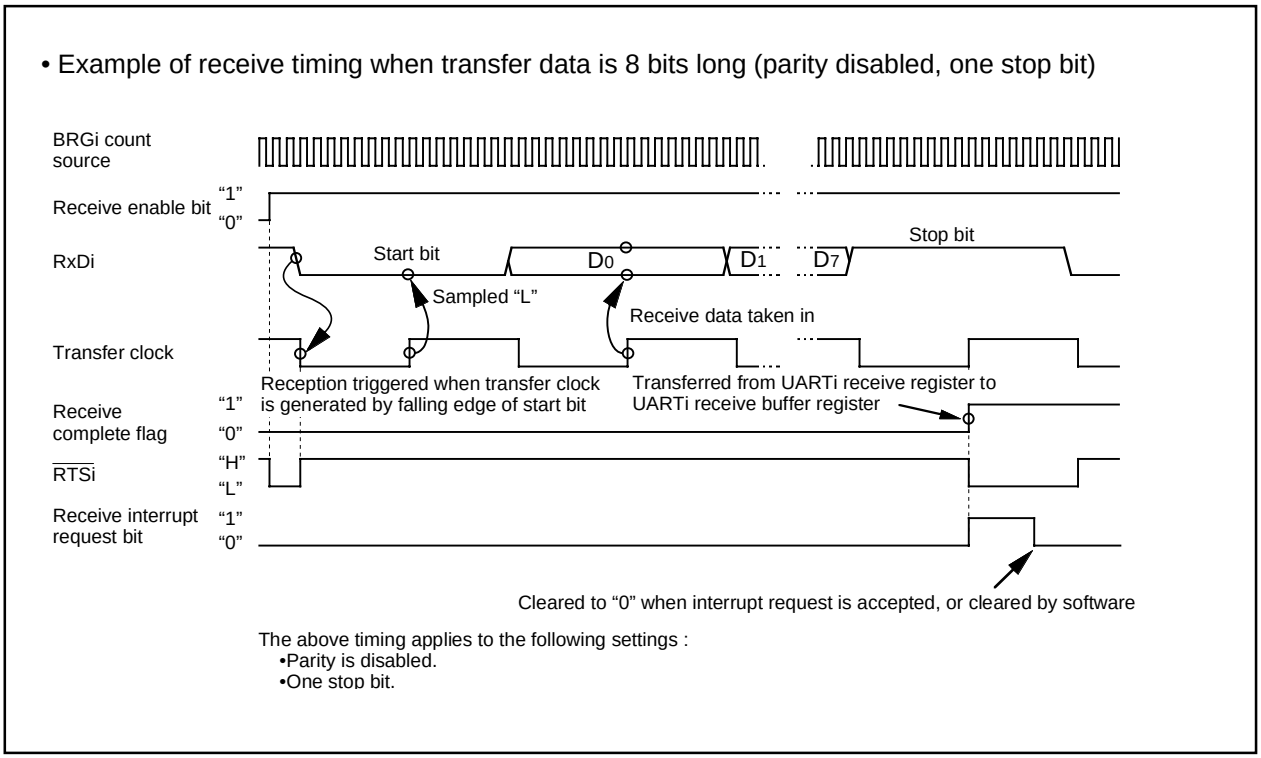


Figure 2.11.19 Typical receive timing in UART mode

(1) Sleep mode (UART0, UART1)

This mode is used to transfer data between specific microcomputers among multiple microcomputers connected using UARTi. The sleep mode is selected when the sleep select bit (bit 7 at addresses $03A0_{16}$, $03A8_{16}$) is set to "1" during reception. In this mode, the unit performs receive operation when the MSB of the received data = "1" and does not perform receive operation when the MSB = "0".

(2) Function for switching serial data logic (UART2)

When the data logic select bit (bit 6 of address $037D_{16}$) is assigned 1, data is inverted in writing to the transmission buffer register or reading the reception buffer register. Figure 2.11.20 shows the example of timing for switching serial data logic.

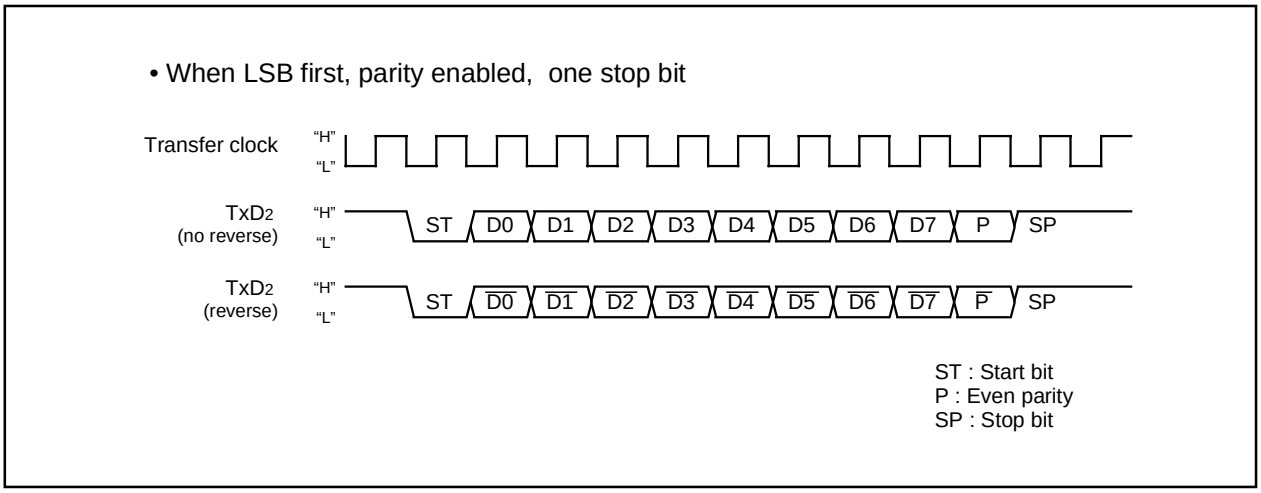

Figure 2.11.20 Timing for switching serial data logic

(3) TxD, RxD I/O polarity reverse function (UART2)

This function is to reverse TXD pin output and RXD pin input. The level of any data to be input or output (including the start bit, stop bit(s), and parity bit) is reversed. Set this function to “0” (not to reverse) for usual use.

(4) Bus collision detection function (UART2)

This function is to sample the output level of the TXD pin and the input level of the RXD pin at the rising edge of the transfer clock; if their values are different, then an interrupt request occurs. Figure 2.11.21 shows the example of detection timing of a buss collision (in UART mode).

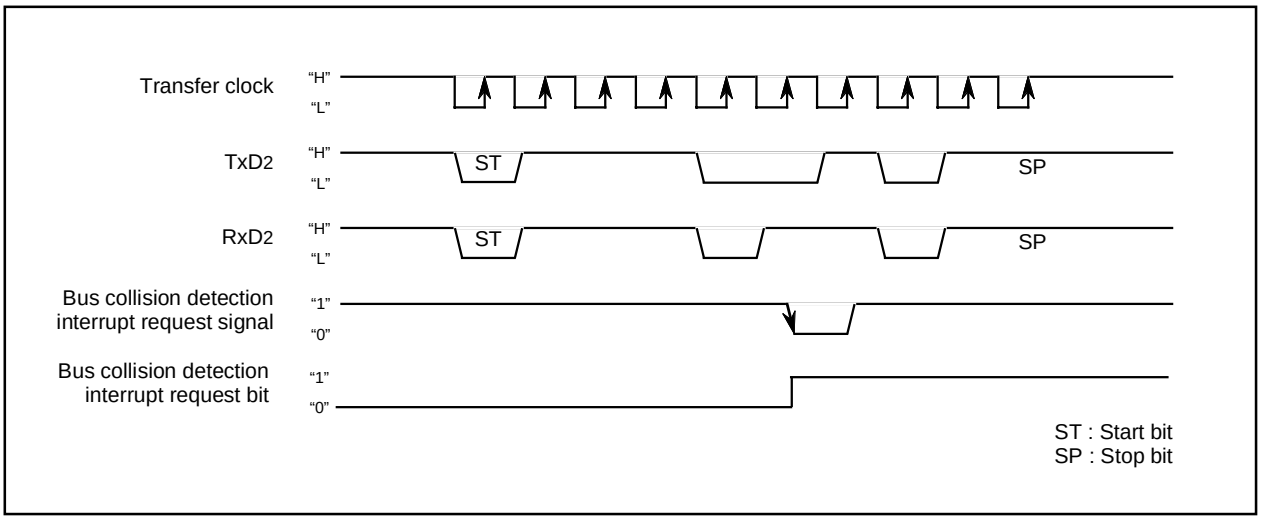

Figure 2.11.21 Detection timing of a bus collision (in UART mode)

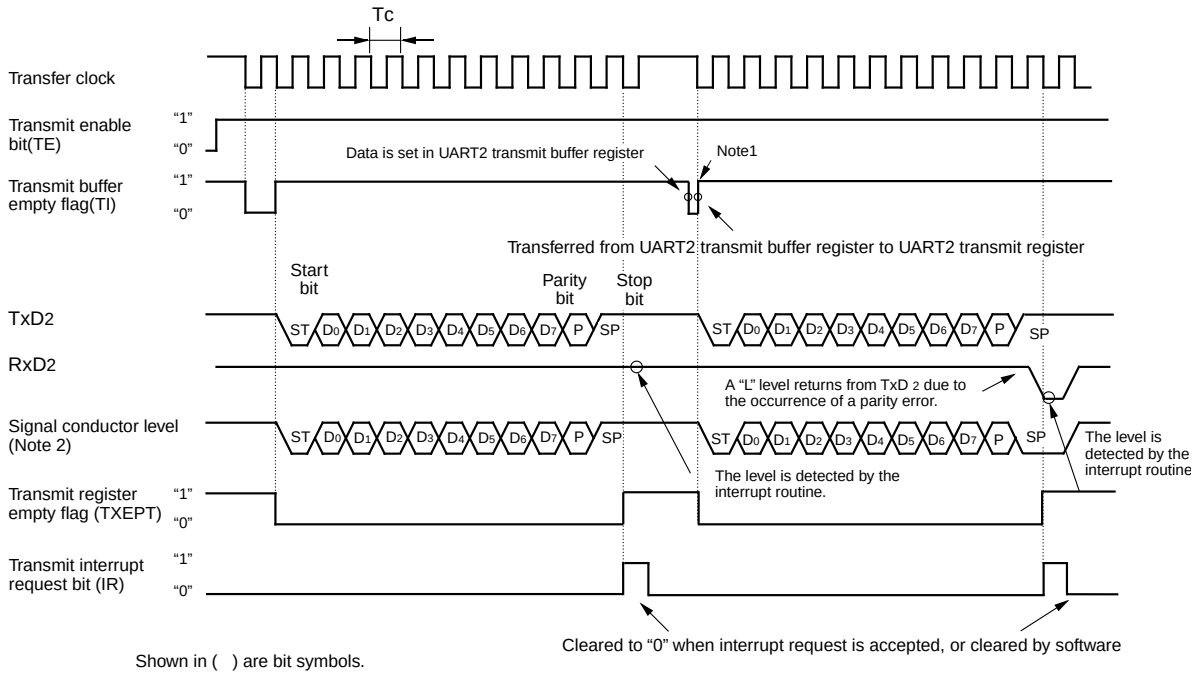
2.11.4 Clock-asynchronous serial I/O mode (compliant with the SIM interface)

The SIM interface is used for connecting the microcomputer with a memory card or the like; adding some extra settings in UART2 clock-asynchronous serial I/O mode allows the user to effect this function. Table 2.11.8 shows the specifications of clock-asynchronous serial I/O mode (compliant with the SIM interface).

Table 2.11.8 Specifications of clock-asynchronous serial I/O mode (compliant with the SIM interface)

Item	Specification
Transfer data format	• Transfer data 8-bit UART mode (bit 2 through bit 0 of address 0378_{16} = "101_2") • One stop bit (bit 4 of address 0378_{16} = "0") • With the direct format chosen Set parity to "even" (bit 5 and bit 6 of address 0378_{16} = "1" and "1" respectively) Set data logic to "direct" (bit 6 of address $037D_{16}$ = "0"). Set transfer format to LSB (bit 7 of address $037C_{16}$ = "0"). • With the inverse format chosen Set parity to "odd" (bit 5 and bit 6 of address 0378_{16} = "0" and "1" respectively) Set data logic to "inverse" (bit 6 of address $037D_{16}$ = "1") Set transfer format to MSB (bit 7 of address $037C_{16}$ = "1")
Transfer clock	• With the internal clock chosen (bit 3 of address 0378_{16} = "0") : fi / 16 (n + 1) (Note 1) : fi=f_1, f_8, f_{32} (Do not set external clock)
Transmission / reception control	• Disable the $\overline{CTS}$ and $\overline{RTS}$ function (bit 4 of address $037C_{16}$ = "1")
Other settings	• The sleep mode select function is not available for UART2 • Set transmission interrupt factor to "transmission completed" (bit 4 of address $037D_{16}$ = "1")
Transmission start condition	• To start transmission, the following requirements must be met: - Transmit enable bit (bit 0 of address $037D_{16}$) = "1" - Transmit buffer empty flag (bit 1 of address $037D_{16}$) = "0"
Reception start condition	• To start reception, the following requirements must be met: - Reception enable bit (bit 2 of address $037D_{16}$) = "1" - Detection of a start bit
Interrupt request generation timing	• When transmitting When data transmission from the UART2 transfer register is completed (bit 4 of address $037D_{16}$ = "1") • When receiving When data transfer from the UART2 receive register to the UART2 receive buffer register is completed
Error detection	• Overrun error (see the specifications of clock-asynchronous serial I/O) (Note 2) • Framing error (see the specifications of clock-asynchronous serial I/O) • Parity error (see the specifications of clock-asynchronous serial I/O) - On the reception side, an "L" level is output from the TxD_2 pin by use of the parity error signal output function (bit 7 of address $037D_{16}$ = "1") when a parity error is detected - On the transmission side, a parity error is detected by the level of input to the RxD_2 pin when a transmission interrupt occurs • The error sum flag (see the specifications of clock-asynchronous serial I/O)

Note 1: 'n' denotes the value 00_{16} to FF_{16} that is set to the UARTi bit rate generator.
Note 2: If an overrun error occurs, the UART2 receive buffer will have the next data written in. Note also that the UART2 receive interrupt request bit does not change.

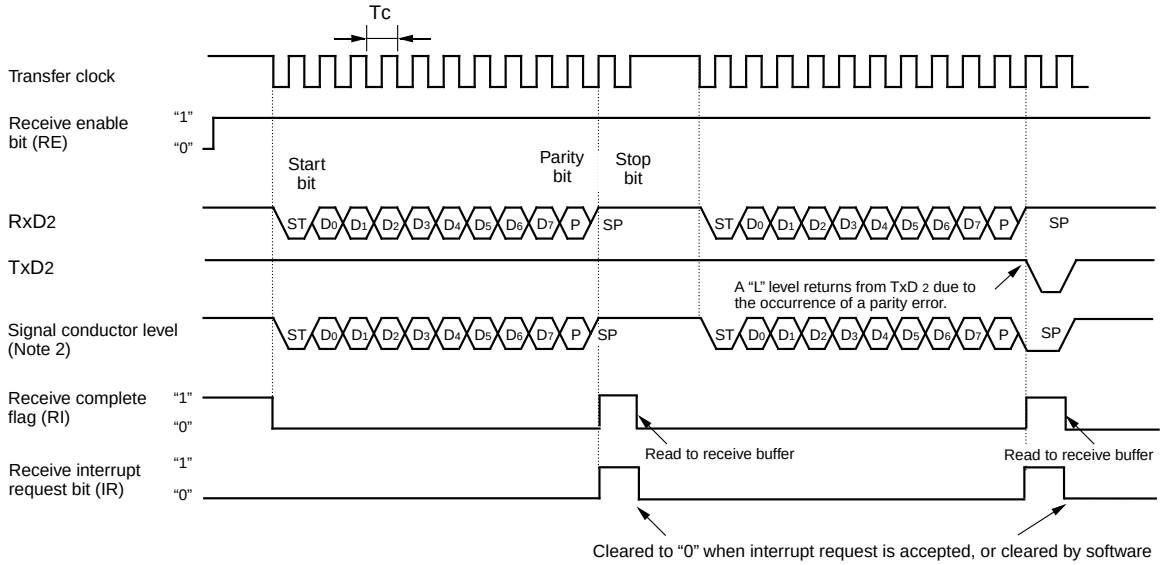


Shown in ( ) are bit symbols.

The above timing applies to the following settings :
- Parity is enabled.
- One stop bit.
- Transmit interrupt cause select bit = "1".

Tc = 16 (n + 1) / fi
fi : frequency of BRG2 count source (f1, f8, f32)
n : value set to BRG2

Note 1: The transmit is started with overflow timing of BRG after having written in a value at the transmit buffer in the above timing.



Shown in ( ) are bit symbols.

The above timing applies to the following settings :
- Parity is enabled.
- One stop bit.
- Transmit interrupt cause select bit = "0".

Tc = 16 (n + 1) / fi
fi : frequency of BRG2 count source (f1, f8, f32)
n : value set to BRG2

Note 2: Equal in waveform because TxD2 and RxD2 are connected.

Figure 2.11.22 Typical transmit/receive timing in UART mode (compliant with the SIM interface)

(1) Parity error signal output function

If a parity error is detected when the error signal output enable bit (address 037D16, bit 7) has been set to "1", a low-level signal can be output from the TxD2 pin. Also, when operating in transmit mode, a transmit-complete interrupt is generated a half transfer clock cycle later than when the error signal output enable bit (address 037D16, bit 7) is set to "0". Therefore, a parity error signal can be detected in the transmit-complete interrupt program. Figure 2.11.23 shows the timing at which a parity error signal is output.

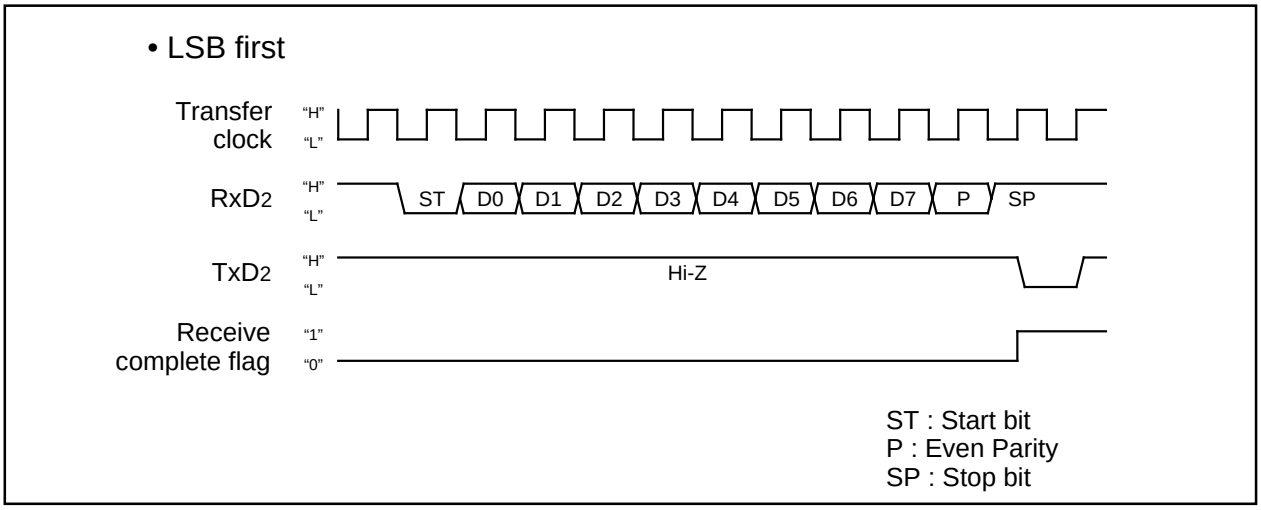


Figure 2.11.23 Output timing of the parity error signal

(2) Direct format/inverse format

Connecting the SIM card allows you to switch between direct format and inverse format. If you choose the direct format, D0 data is output from TxD2. If you choose the inverse format, D7 data is inverted and output from TxD2.

Figure 2.11.24 shows the SIM interface format.

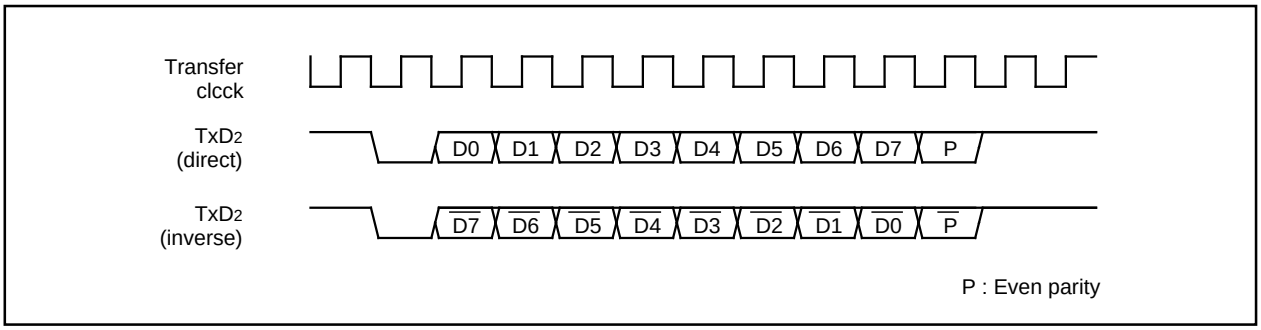

Figure 2.11.24 SIM interface format

Figure 2.11.25 shows the example of connecting the SIM interface. Connect TxD2 and RxD2 and apply pull-up.

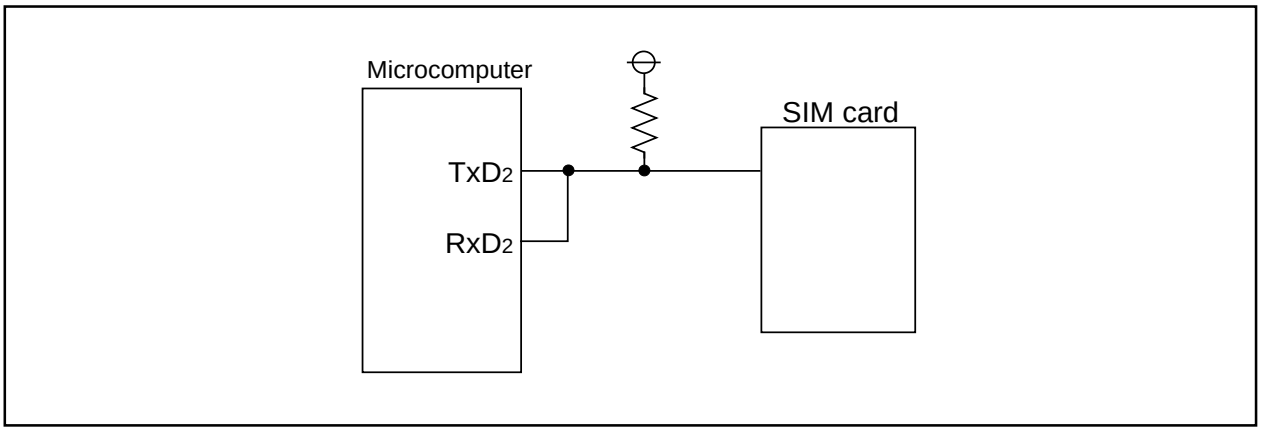

Figure 2.11.25 Connecting the SIM interface

2.11.5 UART2 Special Mode Register

The UART2 special mode register (address 037716) is used to control UART2 in various ways.

Figure 2.11.26 shows the UART2 special mode register.

Bit 0 of the UART special mode register (037716) is used as the I2C mode selection bit.

Setting "1" in the I2C mode select bit (bit 0) goes the circuit to achieve the I2C bus interface effective.

Since this function uses clock-synchronous serial I/O mode, set this bit to "0" in UART mode.

UART2 special mode register

b7 b6 b5 b4 b3 b2 b1 b0

Symbol: U2SMR | Address: 037716 | When reset: 0016

Bit symbol	Bit name	Function (During clock synchronous serial I/O mode)	Function (During UART mode)	R	W
IICM	I2C mode selection bit	0 : Normal mode 1 : I2C mode	Must always be "0"	○	○
ABC	Arbitration lost detecting flag control bit	0 : Update per bit 1 : Update per byte	Must always be "0"	○	○
BBS	Bus busy flag	0 : STOP condition detected 1 : START condition detected	Must always be "0"	○	○ (Note 1)
LSYN	SCLL sync output enable bit	0 : Disabled 1 : Enabled	Must always be "0"	○	○
ABSCS	Bus collision detect sampling clock select bit	Must always be "0"	0 : Rising edge of transfer clock 1 : Underflow signal of timer A0	○	○
ACSE	Auto clear function select bit of transmit enable bit	Must always be "0"	0 : No auto clear function 1 : Auto clear at occurrence of bus collision	○	○
SSS	Transmit start condition select bit	Must always be "0"	0 : Ordinary 1 : Falling edge of RxD2	○	○
SDDS	SDA digital delay select bit (Notes 2 and 3)	0 : Selects analog delay output 1 : Selects digital delay output (Must always be "0" except at I2C mode)	Must always be "0"	○	○

Notes 1: Nothing but "0" may be written.
2: Do not write "1" except at I2C mode. Must always be "0" at normal mode.
Bit 7 to bit5 (DL2 to DL0 = SDA digital delay value setting bit) of UART2 special mode register 3 (U2SMR3/address 037516) are initialized and become "000" when this bit is "0", analog delay circuit is selected. Reading and writing U2SMR are enable when SDDS = "0" .
3: Delaying ; Only analog delay value when analog delay is selected, and only digital delay value when digital delay is selected.

UART2 special mode register 3 (I2C bus exclusive register)

b7 b6 b5 b4 b3 b2 b1 b0

Symbol: U2SMR3 | Address: 037516 | When reset: Indeterminate (initializing value is "0016" at SDDS = "1")

Bit symbol	Bit name	Function (I2C bus exclusive)	R	W
Nothing is assigned. In an attempt to write to this bit, write "0". The value, if read, turns out to be "0". "0" is read out when SDDS = 1.			–	–
DL0	SDA digital delay value set bit	b7 b6 b5 0 0 0 : Selects analog delay 0 0 1 : 1–2 cycle of 1/f (Xin)(Digital delay) 0 1 0 : 2–3 cycle of 1/f (Xin)(Digital delay) 0 1 1 : 3–4 cycle of 1/f (Xin)(Digital delay) 1 0 0 : 4–5 cycle of 1/f (Xin)(Digital delay) 1 0 1 : 5–6 cycle of 1/f (Xin)(Digital delay) 1 1 0 : 6–7 cycle of 1/f (Xin)(Digital delay) 1 1 1 : 7–8 cycle of 1/f (Xin)(Digital delay)	○	○
DL1			○	○
DL2			○	○

Notes 1: Reading and writing is possible when bit7 (SDDS = SDA digital delay selection bit) of UART2 special mode register (U2SMR/address 0377 16) is "1". When set SDDS = "1" and read out initialized value of UART2 special mode register 3(U2SMR3), this value is "0016".When set SDDS = "1" and write to UART2 special mode register 3(U2SMR3), set "0" to bit 0 to bit 4. When SDDS = "0", writing is enable. When read out, this value is indeterminate.
2: When SDDS = "0" , this bit is initialized and become "000", selected analog delay circuit. This bit is become "000" after end reset released, and selected analog delay circuit. Reading out is possible when only SDDS = "1". when SDDS = "0", value which was read out is indeterminate.
3: Delaying ; Only analog delay value when analog delay is selected, and only digital delay value when digital delay is selected.
4: Delay level depends on SCL pin and SDA pin. And, when use external clock, delay is increase around 100ns. So test first, and use this.

Figure 2.11.26 UART2 special mode register

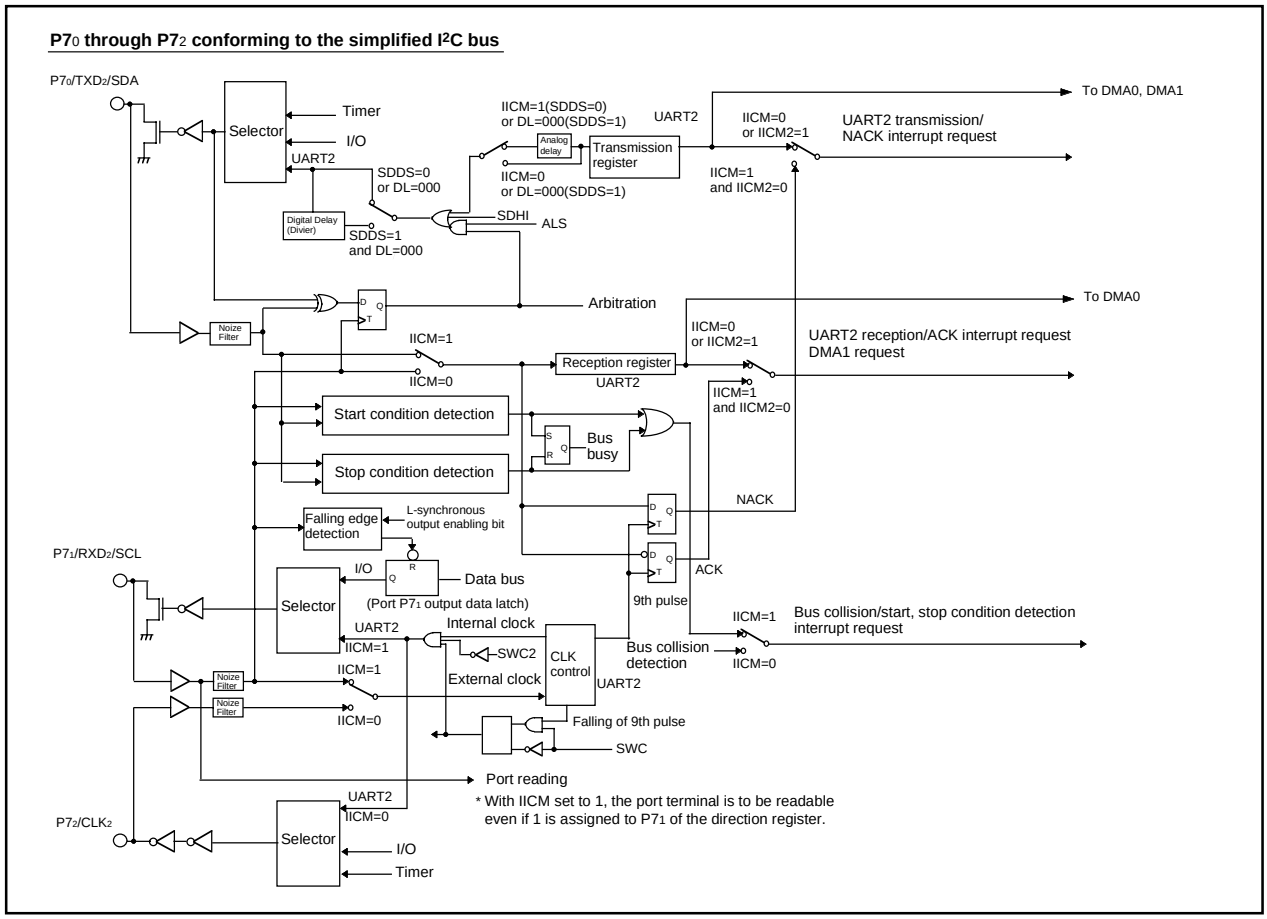

Figure 2.11.27 Functional block diagram for I²C mode

Table 2.11.9 Features in I²C mode

	Function	Normal mode	I²C mode (Note 1)
1	Factor of interrupt number 10 (Note 2)	Bus collision detection	Start condition detection or stop condition detection
2	Factor of interrupt number 15 (Note 2)	UART2 transmission	No acknowledgment detection (NACK)
3	Factor of interrupt number 16 (Note 2)	UART2 reception	Acknowledgment detection (ACK)
4	UART2 transmission output delay	Not delayed	Delayed(Digital / analog selection is possible)
5	P70 at the time when UART2 is in use	TxD2 (output)	SDA (input/output) (Note 3)
6	P71 at the time when UART2 is in use	RxD2 (input)	SCL (input/output)
7	P72 at the time when UART2 is in use	CLK2	P72
8	DMA1 factor at the time when 1 1 0 1 is assigned to the DMA request factor selection bits	UART2 reception	Acknowledgment detection (ACK)
9	Noise filter width	15ns	50ns
10	Reading P71	Reading the terminal when 0 is assigned to the direction register	Reading the terminal regardless of the value of the direction register
11	Initial value of UART2 output	H level (when 0 is assigned to the CLK polarity select bit)	The value set in latch P70 when the port is selected

Note 1: Make the settings given below when I²C mode is in use.
Set 0 1 0 in bits 2, 1, 0 of the UART2 transmission/reception mode register.
Disable the RTS/CTS function. Choose the MSB First function.
Note 2: Follow the steps given below to switch from a factor to another.
1. Disable the interrupt of the corresponding number.
2. Switch from a factor to another.
3. Reset the interrupt request flag of the corresponding number.
4. Set an interrupt level of the corresponding number.
Note 3: Set an initial value of SDA transmission output when serial I/O is invalid.

Figure 2.11.27 hows the functional block diagram for I^2C mode. Setting “1” in the I^2C mode selection bit (IICM) causes ports $P7_0$, $P7_1$, and $P7_2$ to work as data transmission-reception terminal SDA, clock input-output terminal SCL, and port $P7_2$ respectively. A delay circuit is added to the SDA transmission output, so the SDA output changes after SCL fully goes to “L”. Can select analog delay or digital delay by SDA digital delay selection bit (7 bit of address 0377_{16}). When select digital delay, can select delay to 2 cycle to 8 cycle of f1 by UART2 special mode register 3 (address 0375_{16}) . Functions changed by I^2C mode selection bit 2 is shown in below.

Table 2.11.10 Delay circuit selection condition

	Register value			Contents
	IICM	SDDS	DL	
Digital delay selection	1	1	001 to 111	When select digital delay, analog delay is not added. Only digital delay.
Analog delay selection	1	1	000	When select DL="000" , analog delay is chosen regardless of the value of SDDS.
		0	(000)	When SDDS="0" , DL is initialized and DL="000".
No delay	0	0	(000)	Delay circuit is not selected when IICM="0". But, must set SDDS="0" when IICM="0".

An attempt to read Port $P7_1$ (SCL) results in getting the terminal’s level regardless of the content of the port direction register. The initial value of SDA transmission output in this mode goes to the value set in port $P7_0$. The interrupt factors of the bus collision detection interrupt, UART2 transmission interrupt, and of UART2 reception interrupt turn to the start/stop condition detection interrupt, acknowledgment non-detection interrupt, and acknowledgment detection interrupt respectively.

The start condition detection interrupt refers to the interrupt that occurs when the falling edge of the SDA terminal ($P7_0$) is detected with the SCL terminal ($P7_1$) staying “H”. The stop condition detection interrupt refers to the interrupt that occurs when the rising edge of the SDA terminal ($P7_0$) is detected with the SCL terminal ($P7_1$) staying “H”. The bus busy flag (bit 2 of the UART2 special mode register) is set to “1” by the start condition detection, and set to “0” by the stop condition detection.

The acknowledgment non-detection interrupt refers to the interrupt that occurs when the SDA terminal level is detected still staying “H” at the rising edge of the 9th transmission clock. The acknowledgment detection interrupt refers to the interrupt that occurs when SDA terminal’s level is detected already went to “L” at the 9th transmission clock. Also, assigning 1101(UART2 reception) to the DMA1 request factor select bits provides the means to start up the DMA transfer by the effect of acknowledgment detection.

Bit 1 of the UART2 special mode register (0377_{16}) is used as the arbitration loss detecting flag control bit. Arbitration means the act of detecting the nonconformity between transmission data and SDA terminal data at the timing of the SCL rising edge. This detecting flag is located at bit 11 of the UART2 reception buffer register ($037F_{16}$, $037E_{16}$), and “1” is set in this flag when nonconformity is detected. Use the arbitration lost detecting flag control bit to choose which way to use to update the flag, bit by bit or byte by byte. When setting this bit to “1” and updated the flag byte by byte if nonconformity is detected, the arbitration lost detecting flag is set to “1” at the falling edge of the 9th transmission clock. If update the flag byte by byte, must judge and clear (“0”) the arbitration lost detecting flag after completing the first byte acknowledge detect and before starting the next one byte transmission.

Bit 3 of the UART2 special mode register is used as SCL- and L-synchronous output enable bit. Setting this bit to “1” goes the $P7_1$ data register to “0” in synchronization with the SCL terminal level going to “L”.

Some other functions added are explained here. Figure 2.11.28 shows their workings.

Bit 4 of the UART2 special mode register is used as the bus collision detect sampling clock select bit. The bus collision detect interrupt occurs when the RxD2 level and TxD2 level do not match, but the nonconformity is detected in synchronization with the rising edge of the transfer clock signal if the bit is set to “0”. If this bit is set to “1”, the nonconformity is detected at the timing of the overflow of timer A0 rather than at the rising edge of the transfer clock.

Bit 5 of the UART2 special mode register is used as the auto clear function select bit of transmit enable bit. Setting this bit to “1” automatically resets the transmit enable bit to “0” when “1” is set in the bus collision detect interrupt request bit (nonconformity).

Bit 6 of the UART2 special mode register is used as the transmit start condition select bit. Setting this bit to “1” starts the TxD transmission in synchronization with the falling edge of the RxD terminal.

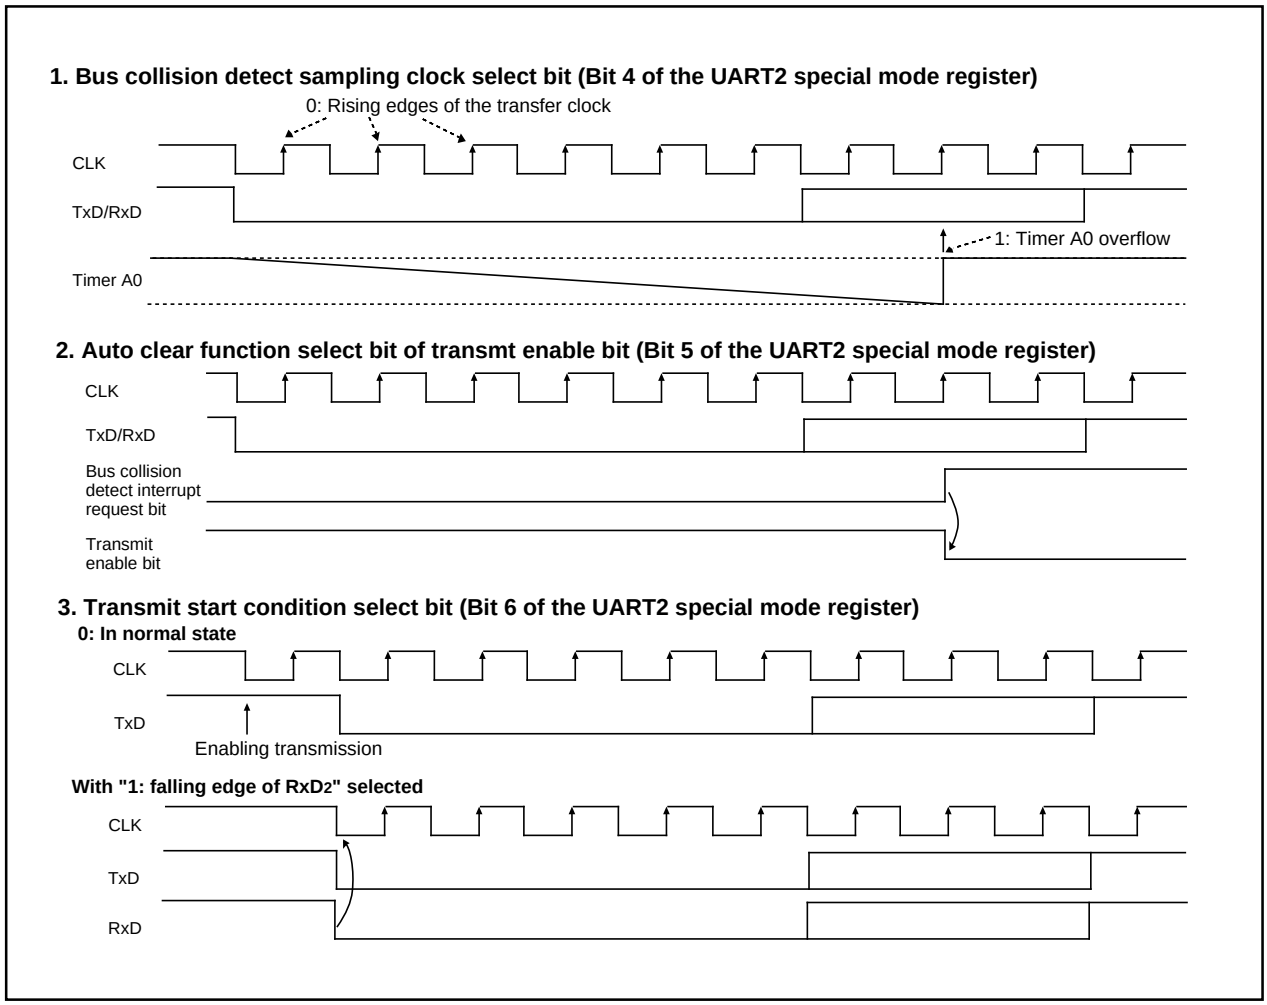

Figure 2.11.28 Some other functions added

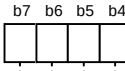
2.11.6 UART2 Special Mode Register 2

UART2 special mode register 2 (address 0376_{16}) is used to further control UART2 in I^2C mode. Figure 2.11.29 shows the UART2 special mode register 2.

UART2 special mode register 2



Symbol: U2SMR2 | Address: 0376_{16} | When reset: 00_{16}

Bit symbol	Bit name	Function	R	W
IICM2	I^2C mode selection bit 2	Refer to Table 2.11.11	○	○
CSC	Clock-synchronous bit	0 : Disabled 1 : Enabled	○	○
SWC	SCL wait output bit	0 : Disabled 1 : Enabled	○	○
ALS	SDA output stop bit	0 : Disabled 1 : Enabled	○	○
STAC	UART2 initialization bit	0 : Disabled 1 : Enabled	○	○
SWC2	SCL wait output bit 2	0: UART2 clock 1: 0 output	○	○
SDHI	SDA output disable bit	0: Enabled 1: Disabled (high impedance)	○	○
SHTC	Start/stop condition control bit	Set this bit to "1" in I^2C mode (refer to Table 2.11.12)	○	○

Figure 2.11.29 UART2 special mode register 2

Bit 0 of the UART2 special mode register 2 (address 0376_{16}) is used as the I^2C mode selection bit 2. Table 2.11.11 shows the types of control to be changed by I^2C mode selection bit 2 when the I^2C mode selection bit is set to "1". Table 2.11.12 shows the timing characteristics of detecting the start condition and the stop condition. Set the start/stop condition control bit (bit 7 of UART2 special mode register 2) to "1" in I^2C mode.

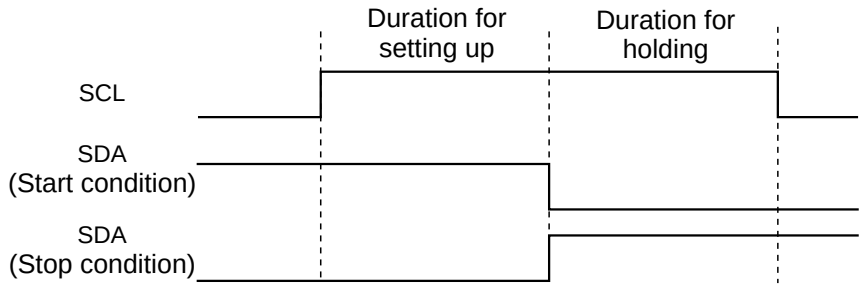
Table 2.11.11 Functions changed by I^2C mode selection bit 2

	Function	IICM2 = 0	IICM2 = 1
1	Factor of interrupt number 15	No acknowledgment detection (NACK)	UART2 transmission (the rising edge of the final bit of the clock)
2	Factor of interrupt number 16	Acknowledgment detection (ACK)	UART2 reception (the falling edge of the final bit of the clock)
3	DMA1 factor at the time when 1 1 0 1 is assigned to the DMA request factor selection bits	Acknowledgment detection (ACK)	UART2 reception (the falling edge of the final bit of the clock)
4	Timing for transferring data from the UART2 reception shift register to the reception buffer.	The rising edge of the final bit of the reception clock	The falling edge of the final bit of the reception clock
5	Timing for generating a UART2 reception/ACK interrupt request	The rising edge of the final bit of the reception clock	The falling edge of the final bit of the reception clock

Table 2.11.12 Timing characteristics of detecting the start condition and the stop condition(Note1)

3 to 6 cycles < duration for setting-up (Note2)
3 to 6 cycles < duration for holding (Note2)

Note 1 : When the start/stop condition count bit is "1" .
Note 2 : "cycles" is in terms of the input oscillation frequency f(X_{IN}) of the main clock.



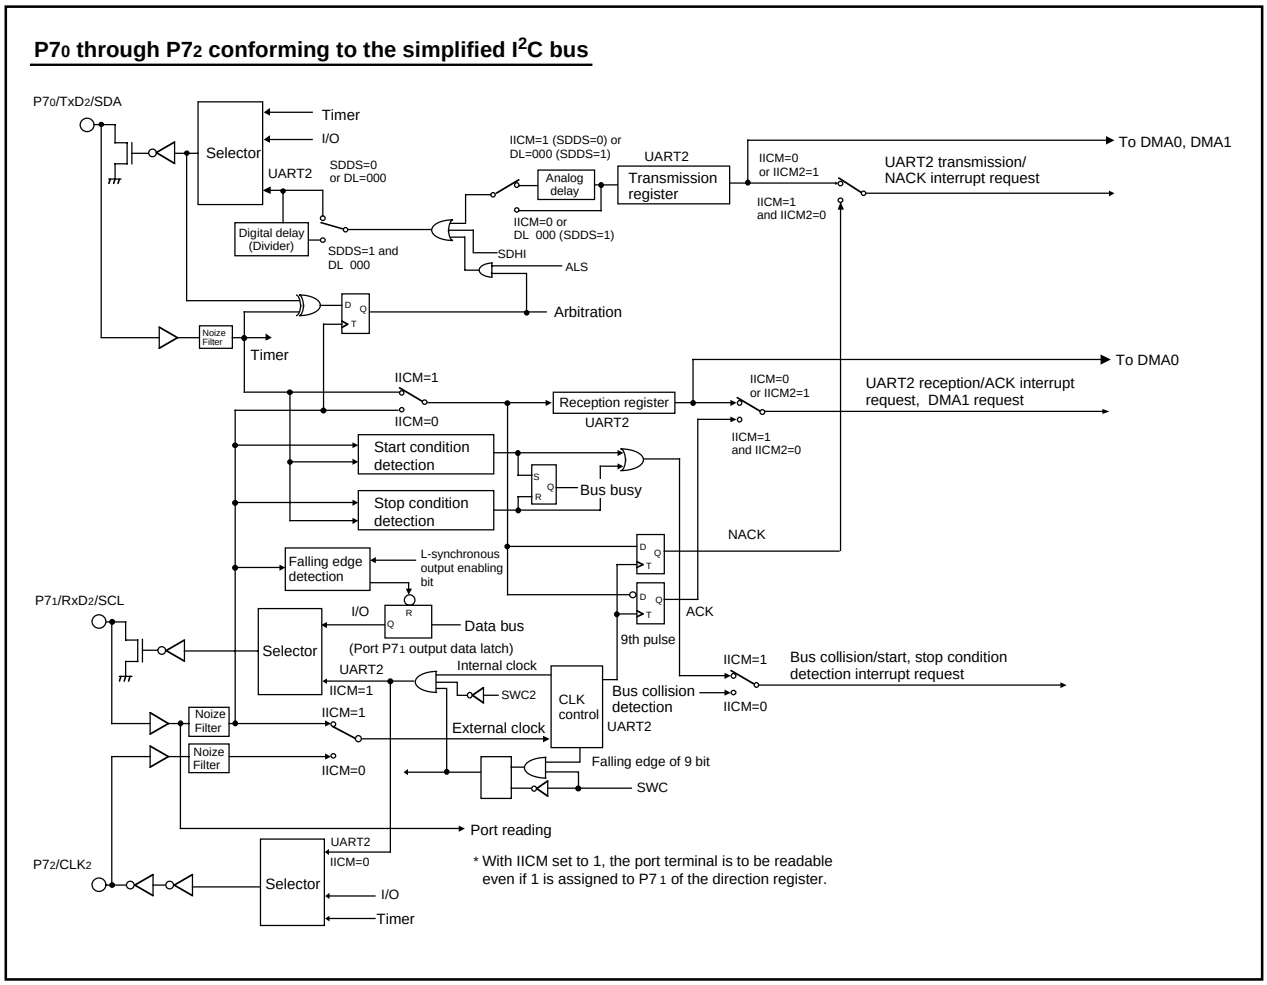


Figure 2.11.30 Functional block diagram for I2C mode

Functions available in I2C mode are shown in Figure 2.11.30— a functional block diagram.

Bit 3 of the UART2 special mode register 2 (address 037616) is used as the SDA output stop bit. Setting this bit to "1" causes an arbitration loss to occur, and the SDA pin turns to high-impedance state the instant when the arbitration loss detection flag is set to "1".

Bit 1 of the UART2 special mode register 2 (address 037616) is used as the clock synchronization bit. With this bit set to "1" at the time when the internal SCL is set to "H", the internal SCL turns to "L" if the falling edge is found in the SCL pin; and the baud rate generator reloads the set value, and start counting within the "L" interval. When the internal SCL changes from "L" to "H" with the SCL pin set to "L", stops counting the baud rate generator, and starts counting it again when the SCL pin turns to "H". Due to this function, the UART2 transmission-reception clock becomes the logical product of the signal flowing through the internal SCL and that flowing through the SCL pin. This function operates over the period from the moment earlier by a half cycle than falling edge of the UART2 first clock to the rising edge of the ninth bit. To use this function, choose the internal clock for the transfer clock.

Bit 2 of the UART2 special mode register 2 (037616) is used as the SCL wait output bit. Setting this bit to "1" causes the SCL pin to be fixed to "L" at the falling edge of the ninth bit of the clock. Setting this bit to "0" frees the output fixed to "L".

Bit 4 of the UART2 special mode register 2 (address 0376$_{16}$) is used as the UART2 initialization bit. Setting this bit to "1", and when the start condition is detected, the microcomputer operates as follows.

(1) The transmission shift register is initialized, and the content of the transmission register is transferred to the transmission shift register. This starts transmission by dealing with the clock entered next as the first bit. The UART2 output value, however, doesn't change until the first bit data is output after the entrance of the clock, and remains unchanged from the value at the moment when the microcomputer detected the start condition.

(2) The reception shift register is initialized, and the microcomputer starts reception by dealing with the clock entered next as the first bit.

(3) The SCL wait output bit turns to "1". This turns the SCL pin to "L" at the falling edge of the ninth bit of the clock.

Starting to transmit/receive signals to/from UART2 using this function doesn't change the value of the transmission buffer empty flag. To use this function, choose the external clock for the transfer clock.

Bit 5 of the UART2 special mode register 2 (0376$_{16}$) is used as the SCL pin wait output bit 2. Setting this bit to "1" with the serial I/O specified allows the user to forcibly output an "L" from the SCL pin even if UART2 is in operation. Setting this bit to "0" frees the "L" output from the SCL pin, and the UART2 clock is input/output.

Bit 6 of the UART2 special mode register 2 (0376$_{16}$) is used as the SDA output enable bit. Setting this bit to "1" forces the SDA pin to turn to the high-impedance state. Refrain from changing the value of this bit at the rising edge of the UART2 transfer clock. There can be instances in which arbitration lost detection flag is turned on.

2.11.7 S I/O3, 4

S I/O3 and S I/O4 are exclusive clock-synchronous serial I/Os.

Figure 2.11.31 shows the S I/O3, 4 block diagram, and Figure 2.11.32 shows the S I/O3, 4 control register.Table 2.11.13 shows the specifications of S I/O3, 4.

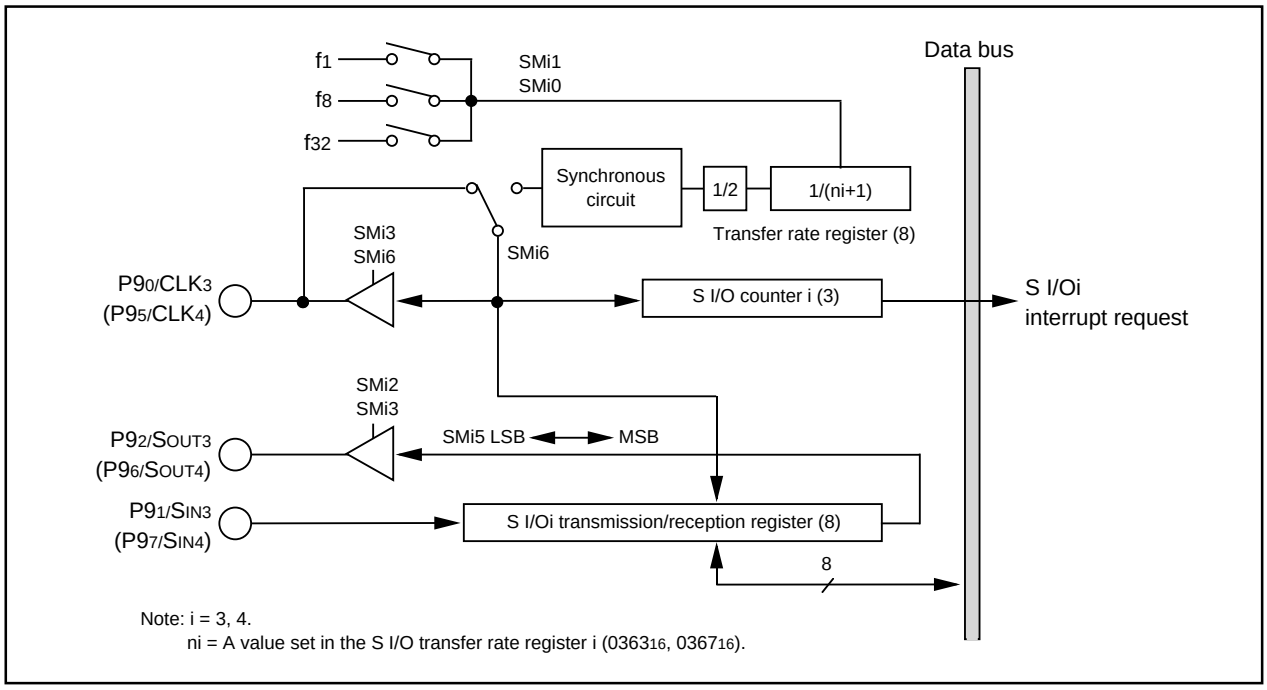

Figure 2.11.31 S I/O3, 4 block diagram

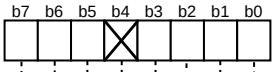
S I/Oi control register (i = 3, 4) (Note 1)



Symbol	Address	When reset
SiC	0362₁₆, 0366₁₆	40₁₆

Bit symbol	Bit name	Description	R	W

Figure 2.11.32 S I/O3, 4 related register

Table 2.11.13 Specifications of S I/O3, 4

Item	Specifications
Transfer data format	• Transfer data length: 8 bits
Transfer clock	• With the internal clock selected (bit 6 of 0362_{16}, 0366_{16} = "1"): f1/2(ni+1), f8/2(ni+1), f32/2(ni+1) (Note 1) • With the external clock selected (bit 6 of 0362_{16}, 0366_{16} = 0):Input from the CLKi terminal (Note 2)
Conditions for transmission/ reception start	• To start transmit/reception, the following requirements must be met: - Select the synchronous clock (use bit 6 of 0362_{16}, 0366_{16}). Select a frequency dividing ratio if the internal clock has been selected (use bits 0 and 1 of 0362_{16}, 0366_{16}). - SOUTi initial value set bit (use bit 7 of 0362_{16}, 0366_{16})= 1. - S I/Oi port select bit (bit 3 of 0362_{16}, 0366_{16}) = 1. - Select the transfer direction (use bit 5 of 0362_{16}, 0366_{16}) -Write transfer data to SI/Oi transmit/receive register (0360_{16}, 0364_{16}) • To use S I/Oi interrupts, the following requirements must be met: - Clear the SI/Oi interrupt request bit before writing transfer data to the SI/Oi transmit/receive register (bit 3 of 0049_{16}, 0048_{16}) = 0.
Interrupt request generation timing	• Rising edge of the last transfer clock. (Note 3)
Select function	• LSB first or MSB first selection Whether transmission/reception begins with bit 0 (LSB) or bit 7 (MSB) can be selected. • Function for setting an SOUTi initial value selection When using an external clock for the transfer clock, the user can choose the SOUTi pin output level during a non-transfer time. For details on how to set, see Figure 2.11.33.
Precaution	• Unlike UART0–2, SI/Oi (i = 3, 4) is not divided for transfer register and buffer. Therefore, do not write the next transfer data to the SI/Oi transmit/receive register (addresses 0360_{16}, 0364_{16}) during a transfer. When the internal clock is selected for the transfer clock, SOUTi holds the last data for a 1/2 transfer clock period after it finished transferring and then goes to a high-impedance state. However, if the transfer data is written to the SI/Oi transmit/receive register (addresses 0360_{16}, 0364_{16}) during this time, SOUTi is placed in the high-impedance state immediately upon writing and the data hold time is thereby reduced.

Note 1: n is a value from 00_{16} through FF_{16} set in the S I/Oi transfer rate register (i = 3, 4).

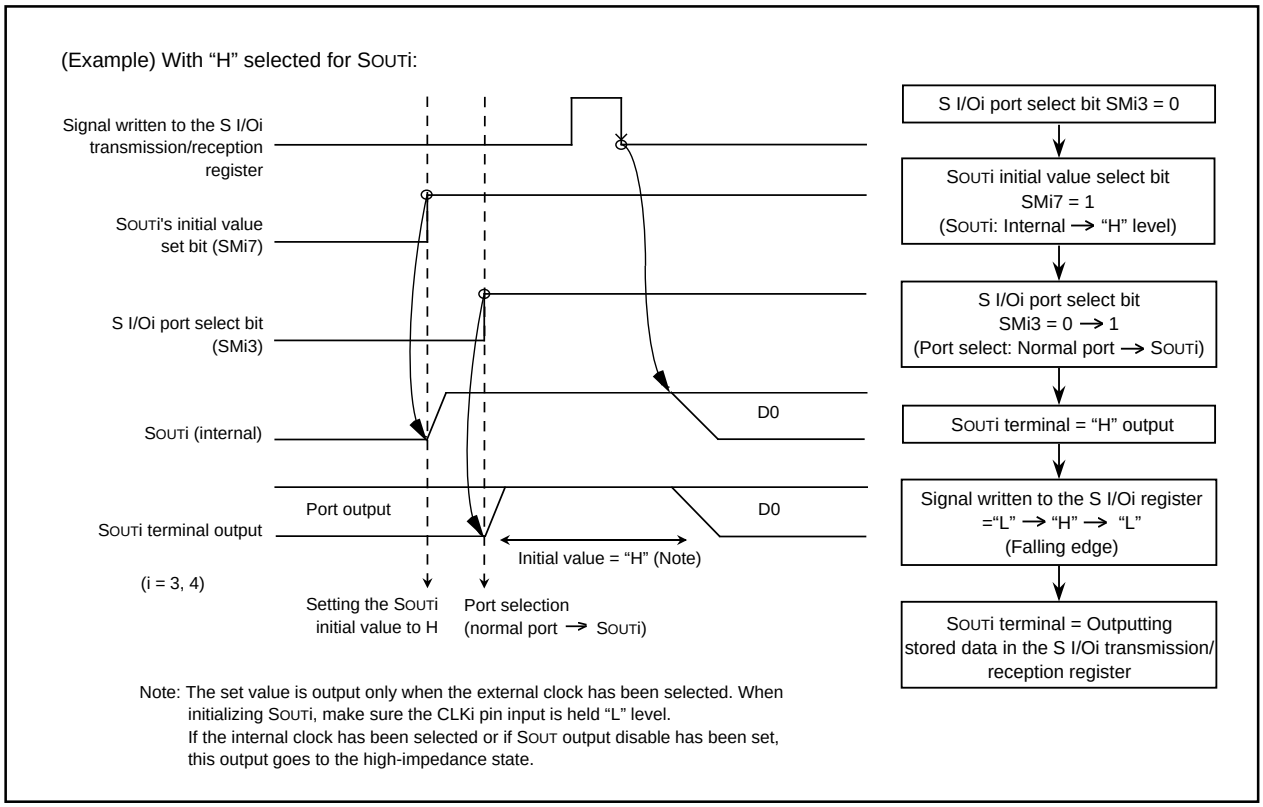
Note 2: With the external clock selected:

- Before data can be written to the SI/Oi transmit/receive register (addresses 0360_{16}, 0364_{16}), the CLKi pin input must be in the low state. Also, before rewriting the SI/Oi Control Register (addresses 0362_{16}, 0366_{16})'s bit 7 (SOUTi initial value set bit), make sure the CLKi pin input is held low.
- The S I/Oi circuit keeps on with the shift operation as long as the synchronous clock is entered in it, so stop the synchronous clock at the instant when it counts to eight. The internal clock, if selected, automatically stops.

Note 3: If the internal clock is used for the synchronous clock, the transfer clock signal stops at the "H" state.

(1) Functions for setting an SOUTi initial value

When using an external clock for the transfer clock, the SOUTi pin output level during a non-transfer time can be set to the high or the low state. Figure 2.11.33 shows the timing chart for setting an SOUTi initial value and how to set it.

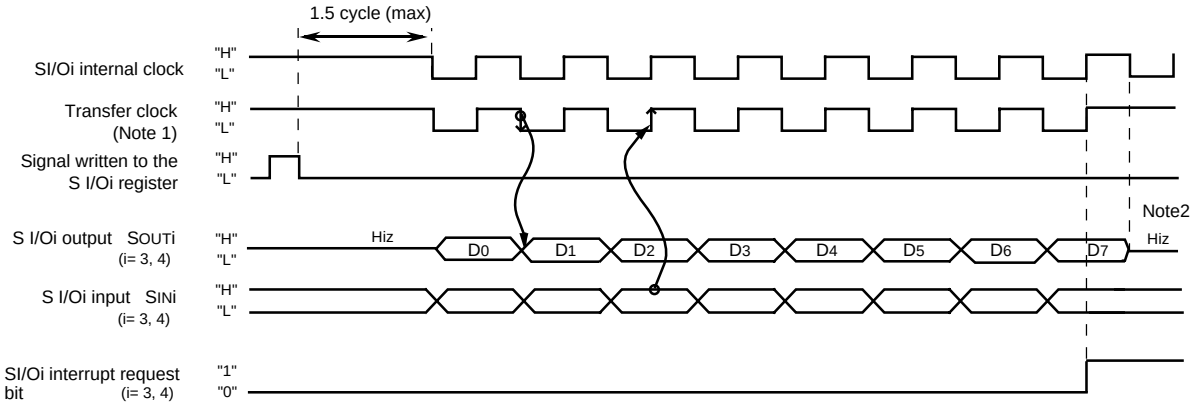


Note: The set value is output only when the external clock has been selected. When initializing SOUTi, make sure the CLKi pin input is held "L" level.
If the internal clock has been selected or if SOUT output disable has been set, this output goes to the high-impedance state.

Figure 2.11.33 Timing chart for setting SOUTi's initial value and how to set it

(2) S I/Oi operation timing

Figure 2.11.34 shows the S I/Oi operation timing



Note 1: With the internal clock selected for the transfer clock, the frequency dividing ratio can be selected using bits 0 and 1 of the S I/Oi control register. (i=3,4) (No frequency division, 8-division frequency, 32-division frequency.)
Note 2: With the internal clock selected for the transfer clock, the SOUTi pin becomes to the high-impedance state after the transfer finishes.
Note 3: Shown above is the case where the SOUTi (i = 3, 4) port select bit ="1".

Figure 22.11.34 S I/Oi operation timing chart

2.12 A-D Converter

The A-D converter consists of one 8-bit successive approximation A-D converter circuit with a capacitive coupling amplifier. Pins P10$_0$ to P10$_7$, P9$_5$, and P9$_6$ also function as the analog signal input pins. The direction registers of these pins for A-D conversion must therefore be set to input. The Vref connect bit (bit 5 at address 03D7$_{16}$) can be used to isolate the resistance ladder of the A-D converter from the reference voltage input pin (V_{REF}) when the A-D converter is not used. Doing so stops any current flowing into the resistance ladder from V_{REF}, reducing the power dissipation. When using the A-D converter, start A-D conversion only after setting bit 5 of 03D7$_{16}$ to connect V_{REF}.

The result of A-D conversion is stored in the A-D registers of the selected pins.

Table 2.12.1 shows the performance of the A-D converter. Figure 2.12.1 shows the block diagram of the A-D converter, and Figures 2.12.2 and 2.12.3 show the A-D converter-related registers.

Table 2.12.1 Performance of A-D converter

Item	Performance
Method of A-D conversion	Successive approximation (capacitive coupling amplifier)
Analog input voltage (Note 1)	0V to AV_{CC} (V_{CC})
Operating clock ϕ_{AD} (Note 2) Resolution	f_{AD}/divide-by-2 of f_{AD}/divide-by-4 of f_{AD}, $f_{AD}=f(X_{IN})$ 8-bit
Absolute precision	● Without sample and hold function ±3LSB ● With sample and hold function ±2LSB
Operating modes	One-shot mode, repeat mode, single sweep mode, repeat sweep mode 0, and repeat sweep mode 1
Analog input pins	8 pins (AN$_0$ to AN$_7$) + 2pins (ANEX0 and ANEX1)
A-D conversion start condition	● Software trigger A-D conversion starts when the A-D conversion start flag changes to “1” ● External trigger (can be retriggered) A-D conversion starts when the A-D conversion start flag is “1” and the $\overline{ADTRG}$/P9$_7$ input changes from “H” to “L”
Conversion speed per pin	● Without sample and hold function 49 ϕ_{AD} cycles ● With sample and hold function 28 ϕ_{AD} cycles

Note 1: Does not depend on use of sample and hold function.

Note 2: Without sample and hold function, set the ϕ_{AD} frequency to 250kHz min.
With the sample and hold function, set the ϕ_{AD} frequency to 1MHz min.

OPA1			O	O

Note 1: If the A-D control register is rewritten during A-D conversion, the conversion result is indeterminate.
Note 2: Neither '01' nor '10' can be selected with the external op-amp connection mode bit.

Figure 2.12.8 A-D conversion register in repeat sweep mode 1

(a) Sample and hold

Sample and hold is selected by setting bit 0 of the A-D control register 2 (address 03D4$_{16}$) to “1”. When sample and hold is selected, the rate of conversion of each pin increases. As a result, a 28 f_{AD} cycle is achieved. Sample and hold can be selected in all modes. However, in all modes, be sure to specify before starting A-D conversion whether sample and hold is to be used.

(b) Extended analog input pins

In one-shot mode and repeat mode, the input via the extended analog input pins ANEX0 and ANEX1 can also be converted from analog to digital.

When bit 6 of the A-D control register 1 (address 03D7$_{16}$) is “1” and bit 7 is “0”, input via ANEX0 is converted from analog to digital. The result of conversion is stored in A-D register 0.

When bit 6 of the A-D control register 1 (address 03D7$_{16}$) is “0” and bit 7 is “1”, input via ANEX1 is converted from analog to digital. The result of conversion is stored in A-D register 1.

(c) External operation amp connection mode

In this mode, multiple external analog inputs via the extended analog input pins, ANEX0 and ANEX1, can be amplified together by just one operation amp and used as the input for A-D conversion.

When bit 6 of the A-D control register 1 (address 03D7$_{16}$) is “1” and bit 7 is “1”, input via AN_0 to AN_7 is output from ANEX0. The input from ANEX1 is converted from analog to digital and the result stored in the corresponding A-D register. The speed of A-D conversion depends on the response of the external operation amp. Do not connect the ANEX0 and ANEX1 pins directly. Figure 2.12.9 is an example of how to connect the pins in external operation amp mode.

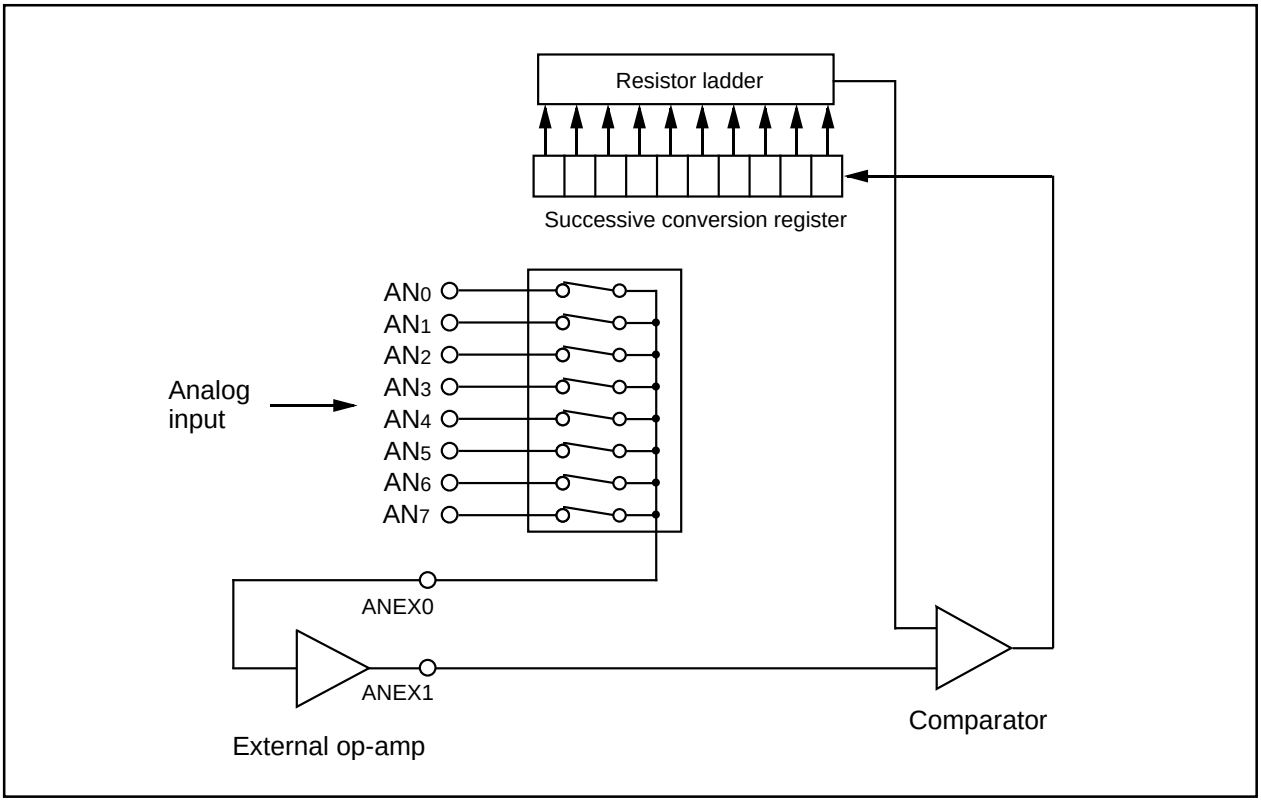

Figure 2.12.9 Example of external op-amp connection mode

2.13 D-A Converter

This is an 8-bit, R-2R type D-A converter. The microcomputer contains two independent D-A converters of this type.

D-A conversion is performed when a value is written to the corresponding D-A register. Bits 0 and 1 (D-A output enable bits) of the D-A control register decide if the result of conversion is to be output. Do not set the target port to output mode if D-A conversion is to be performed.

Output analog voltage (V) is determined by a set value (n : decimal) in the D-A register.

$V = V_{REF} \times n / 256$ (n = 0 to 255)

V_{REF} : reference voltage

Table 2.13.1 lists the performance of the D-A converter. Figure 2.13.1 shows the block diagram of the D-A converter. Figure 2.13.2 shows the D-A control register. Figure 2.13.3 shows the D-A converter equivalent circuit.

Table 2.13.1 Performance of D-A converter

Item	Performance
Conversion method	R-2R method
Resolution	8 bits
Analog output pin	2 channels

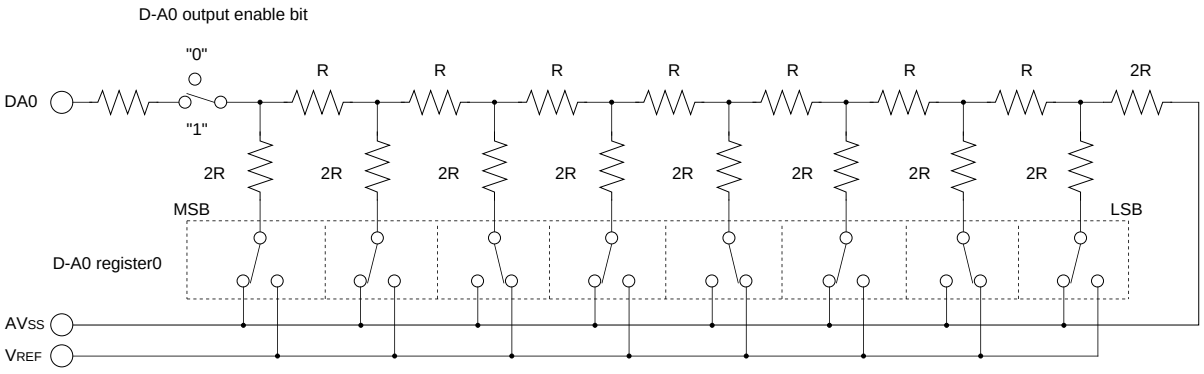
Figure 2.13.2 D-A control register



Note 1: The above diagram shows an instance in which the D-A register is assigned $2A_{16}$.
Note 2: The same circuit as this is also used for D-A1.
Note 3: To reduce the current consumption when the D-A converter is not used, set the D-A output enable bit to 0 and set the D-A register to 00_{16} so that no current flows in the resistors Rs and 2Rs.

Figure 2.13.3 D-A converter equivalent circuit

2.14 CRC Calculation Circuit

The Cyclic Redundancy Check (CRC) calculation circuit detects an error in data blocks. The microcomputer uses a generator polynomial of CRC_CCITT ($X^{16} + X^{12} + X^5 + 1$) to generate CRC code.

The CRC code is a 16-bit code generated for a block of a given data length in multiples of 8 bits. The CRC code is set in a CRC data register each time one byte of data is transferred to a CRC input register after writing an initial value into the CRC data register. Generation of CRC code for one byte of data is completed in two machine cycles.

Figure 2.14.1 shows the block diagram of the CRC circuit. Figure 2.14.2 shows the CRC-related registers. Figure 2.14.3 shows the calculation example using the CRC calculation circuit

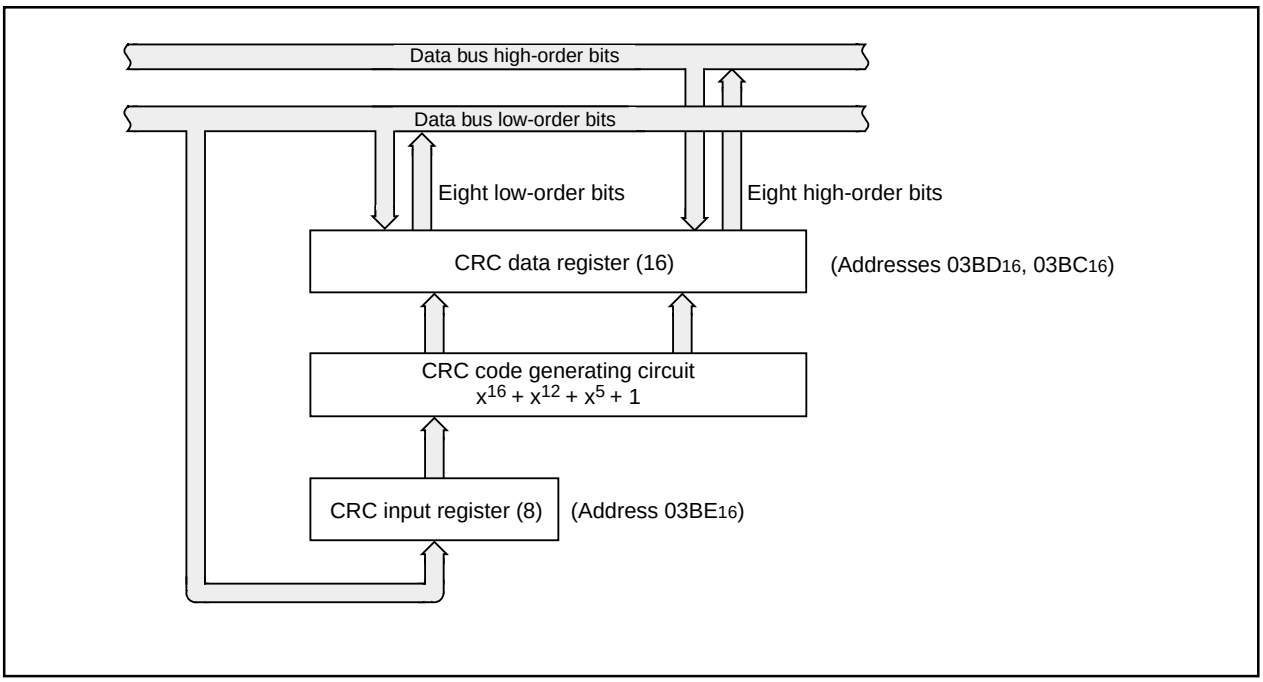


Figure 2.14.1 Block diagram of CRC circuit

2.15 Expansion Function

2.15.1 Expansion function description

Expansion function cousists of data acquisition function and humming decoder function. Each function is controld by expansion memories.

(1) Data acquisition function

Corresponds to

Hardware : TELETEXT, PDC, VPS, VBI and EPG-J

Software : XDS, WSS and VBI-ID

(2) Humming decoder function

8/4 humming and 24/18 humming

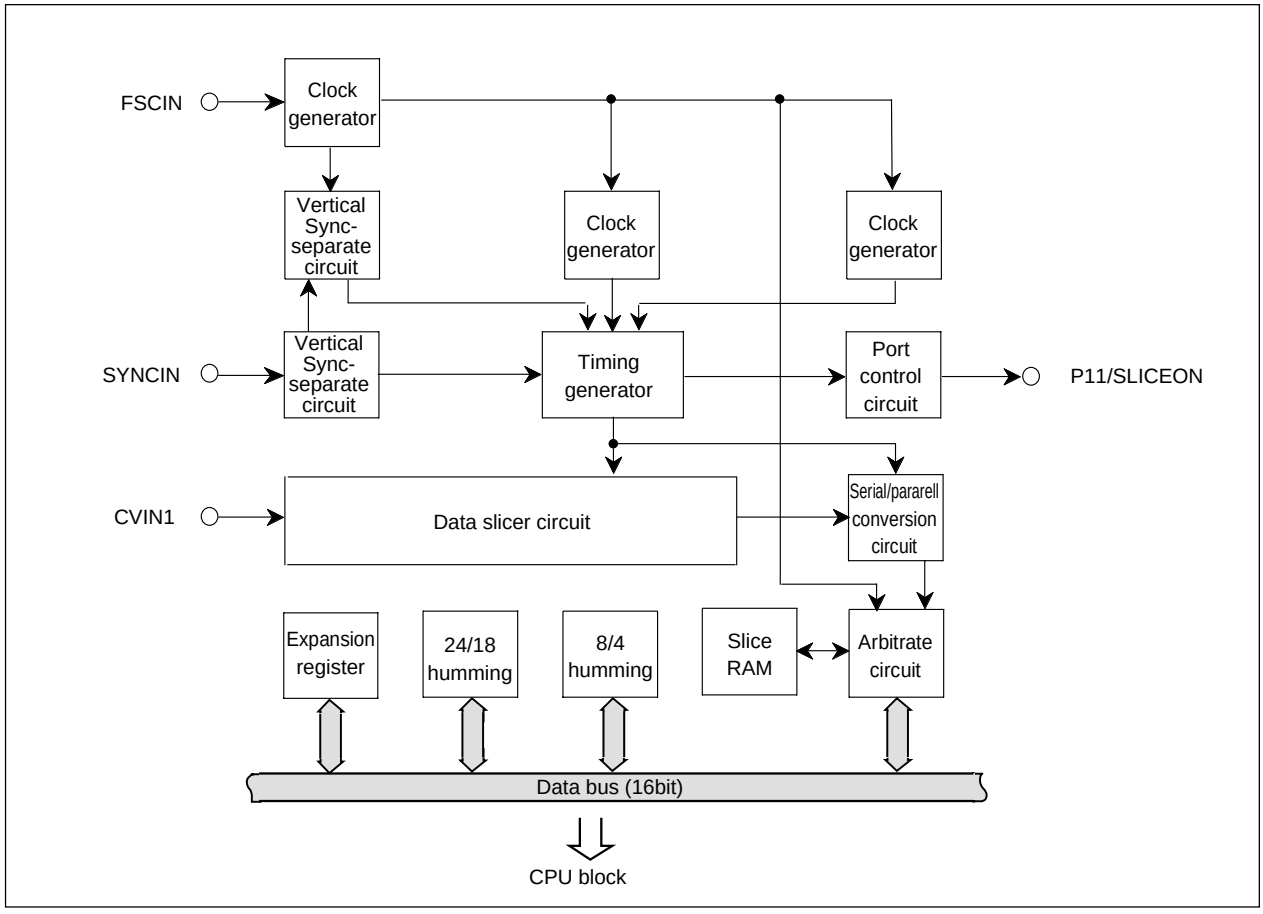

Figure 2.15.1 Block diagram of expansion function

2.15.2 Expansion memory

Expansion function memory is divided by 2 patterns ; Slice RAM and expansion register. (Humming decoder operates by the register placed on SFR). Data writing and read out to the Slice RAM and the expansion register are carried out 16 bit unit by the data setting register (addresses $020E_{16}$, 0210_{16}, 0216_{16} and 0218_{16}) placed on SFR.

Contents of each memory and data setting register are shown in Table 2.15.1.

Table 2.15.1 Expansion memory composition

Expansion memory	Contents	Data setting register
Slice RAM	Store acquisition data.	Slice RAM address control register ($020E_{16}$) Slice RAM data control register (0210_{16})
Expansion register	This register controls data acquisition	Expansion register address control register (0216_{16}) Expansion register data control register (0218_{16})

2.15.3 Slice RAM

Store 18-line slice data. There are 3 types of Slice data : PDC, VPS and VBI. All data are stored to addresses which corresponds to acquisition line (ex. 22 line' data is stored to addresses 200_{16} to 217_{16}). 24 addresses (SR00x to SR17x) are prepared for 1 line, acquisition data is stored in order from LSB side. Then, acquisition datas and field information are stored to the top address of each line. Slice RAM composite is shown in Table 2.15.2.

Table 2.15.2 Slice RAM composition

237_{16}	SR17F	SR17E	SR17D	SR17C	SR17B	SR17A	SR179	SR178	SR177	SR176	SR175	SR174	SR173	SR172	SR171	SR170	

For accessing to Slice RAM data, set accessing address (SA9 to SA0) (shown in Table 2.15.2) to Slice RAM address control register (address $020E_{16}$). Then read out data from Slice RAM data control register (address 0210_{16}). When end the data reading, Slice RAM address control register increments address automatically. Then, next address data reading is possible. Do not access to unused area of each character codes. Must set address to each line because unused area has no address' automatically increment.

Slice RAM bit composition is shown in Figure 2.15.2, Slice RAM access registers are shown in Figure 2.15.3 and Slice RAM access block diagram is shown in Figure 2.15.4.

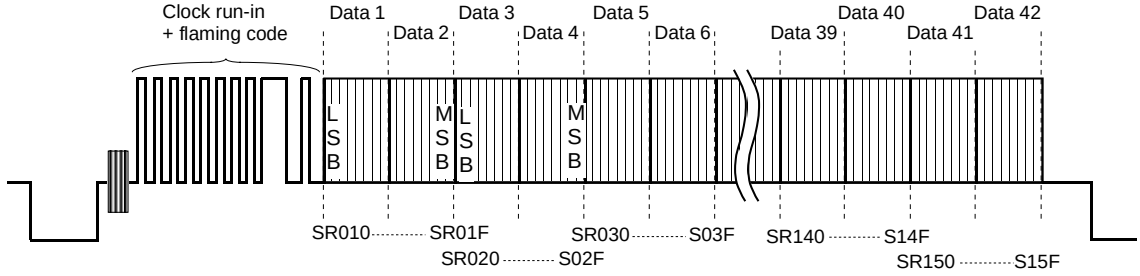
The each head address of the address is corresponded to acquisition line has stored next acquisition information.

	SR00F to SR004	SR003	SR002	SR001	SR000
PDC	0	field * (Note)	0	0	1
VPS	0	field * (Note)	0	1	0
VBI	0	field * (Note)	1	0	0
Other	0	0	0	0	0

Note : * the first field : 1
the second field : 0

(1) PDC

In case of the PDC data, 16 bits (2 data) are stored for the 1 address from the LSB side.



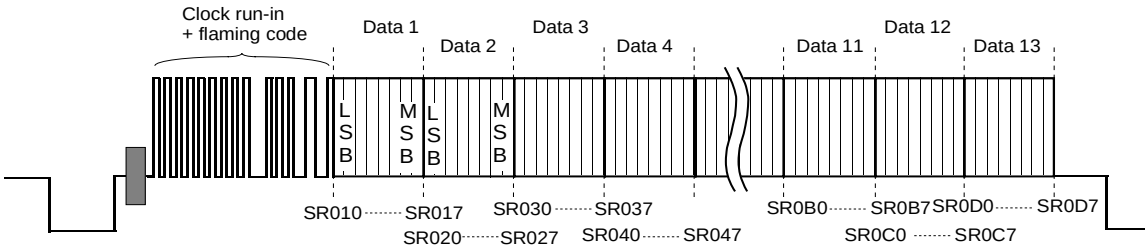
SR16x to SR17x are unused area.

(2) VPS

In case of the VPS data, 8 bits (a data) are stored for an address from the LSB side.

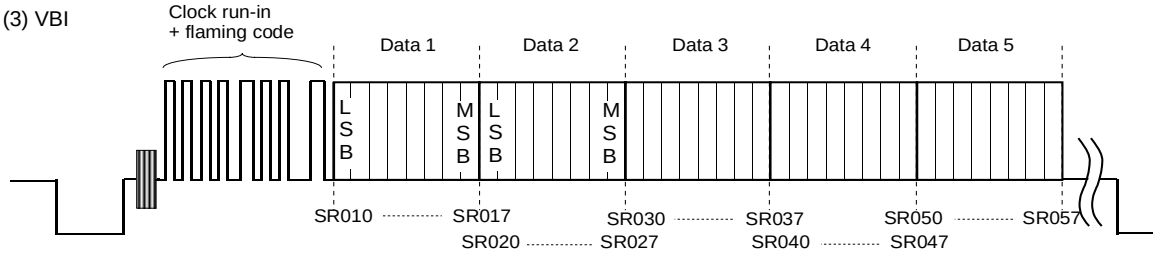
Low-order 8 bits stores the acquisition data. And, high-order 8 bits become warning bit, when the send data is not recognized as bi-phase type.

The case of bi-phase data ="1,0" or "0,1" (the bi-phase type) becomes "0" for this warning bit, and it becomes "1" in bi-phase data ="0,0" or "1,1" (it is not the bi-phase type). (For example, bi-phase data of SR011 is "0,0" or "1,1", "1" is set to SR019.)



SR0Ex to SR17x are unused area.

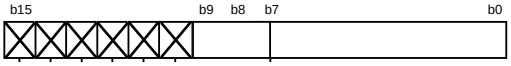
(3) VBI



SR06x to SR17x are unused area.

Figure 2.15.2 Slice RAM bit composition

Slice RAM address control register

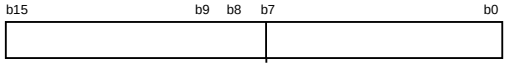


Symbol	Address	When reset
SA	020E16	000016

Function	Setting possible value	R	W
Specify accessing Slice RAM address	000016 to 23716	X	O
Nothing is assigned. In an attempt to write to these bits, write “0”. The value, if read, turns out to be indeterminated.		–	–

Note : When access to Slice RAM, must be set Slice RAM at first, then use Slice RAM data control register (021016).
Slice RAM address control register increments by accessing Slice RAM data control register. So, it is not neccesary to setting the next Slice RAM address.

Slice RAM data control register



Symbol	Address	When reset
SD	021016	000016

Function	R	W
Read out the data of Slice RAM. Read out data of Slice RAM which is specified by Slice RAM address control register (address 020E16) by reading this register.	O	X

Note : Data access must be 16-bit unit. 8-bit unit access is disable.

For accessing to expantion register data, set accessing address (DA5 to DA0) (shown in Table 2.15.3) to expantion register address control register (address 0216_{16}). Then write data (DD15 to DD0) by expantion register data control register (address 0218_{16}). When end the data accessing, expantion register address control register increments address automatically. Then, next address data writing is possible.

Expantion register access registers are shown in Figure 2.15.5, expansion register access block diagram is shown in Figure 2.15.6, and expansion register bit compositions are shown in p153 to 163.

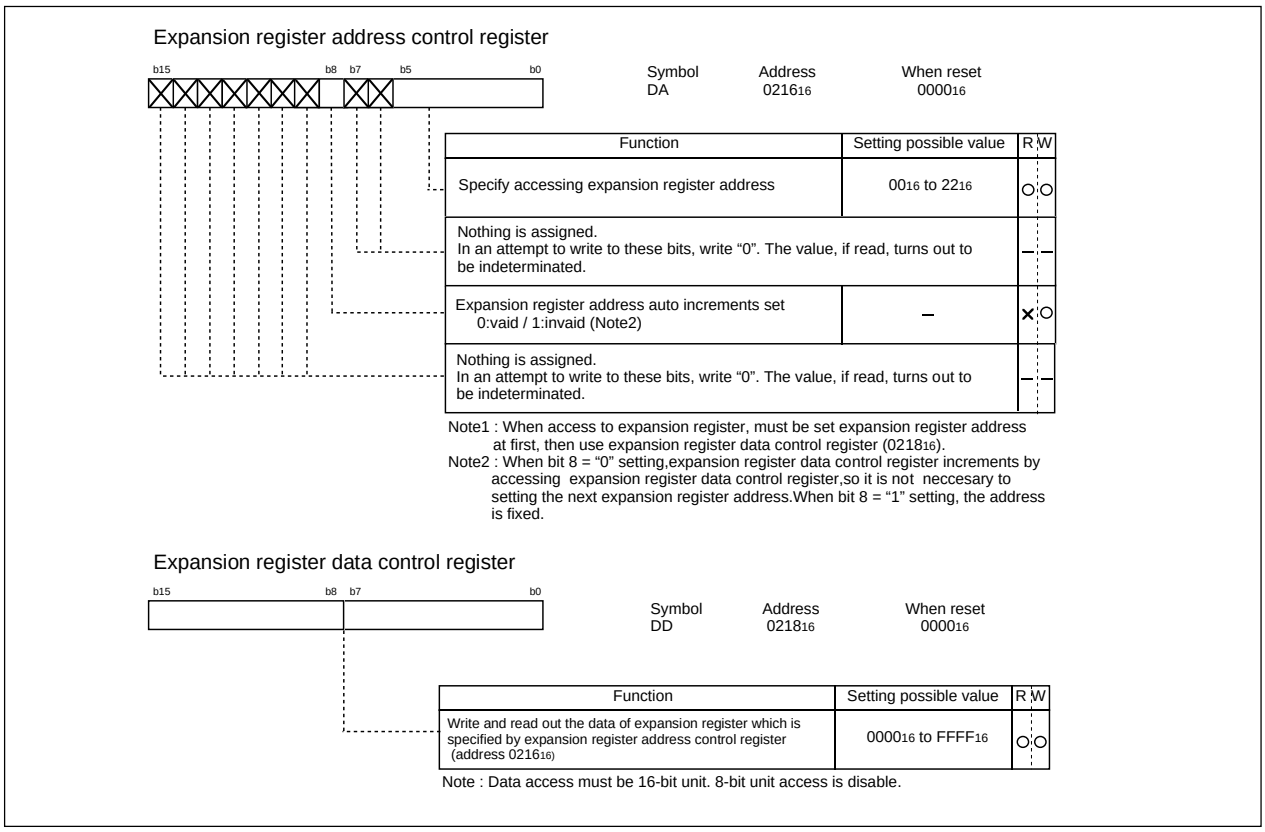

Figure 2.15.5 Expansion register access registers composition

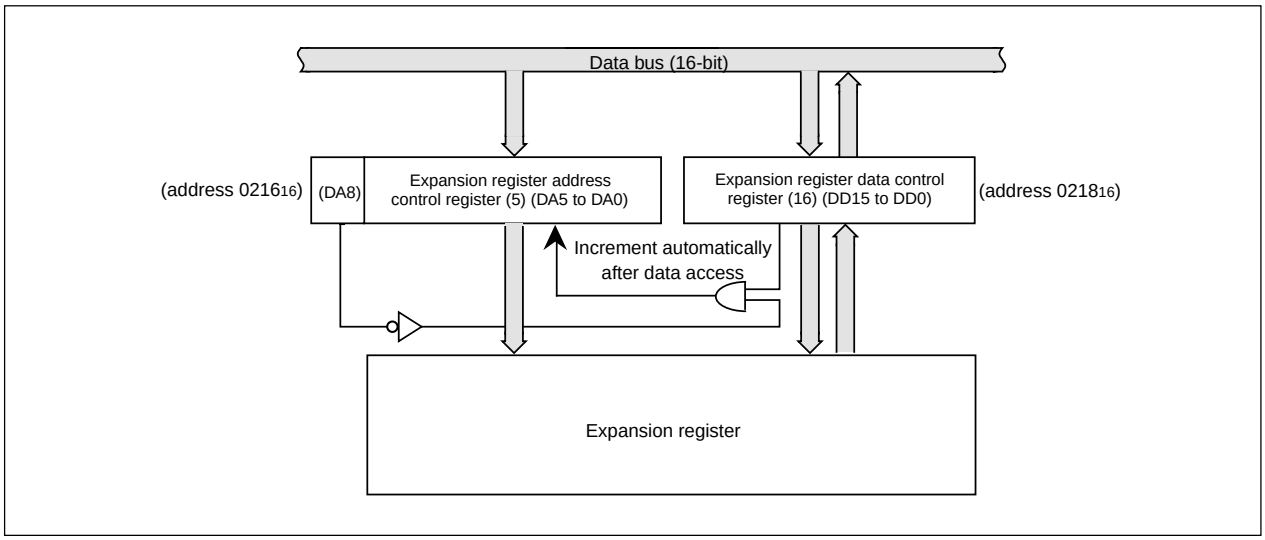

Figure 2.15.6 Expansion register access block diagram

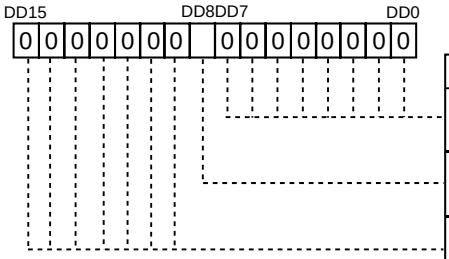
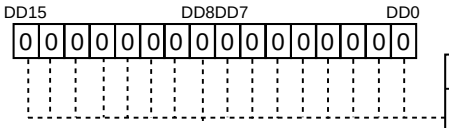
Expansion register construction

(1) Address 00$_{16}$ (= DA5 to 0)



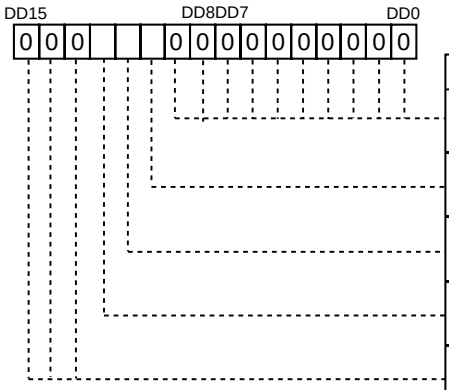
Bit symbol	Bit name	Function		R	W
Reserved bit		Must always be set to "0".		×	○
STBY0	Stand-by mode selection bit	0	Normal mode	○	○
		1	Stand-by mode		
Reserved bit		Must always be set to "0".		×	○

(2) Addresses 01$_{16}$, 02$_{16}$ (= DA5 to 0)



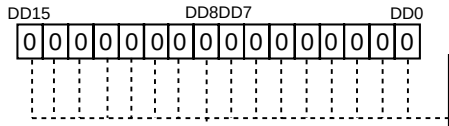
Bit symbol	Bit name	Function	R	W
Reserved bit		Must always be set to "0".	×	○

(3) Address 03$_{16}$ (= DA5 to 0)



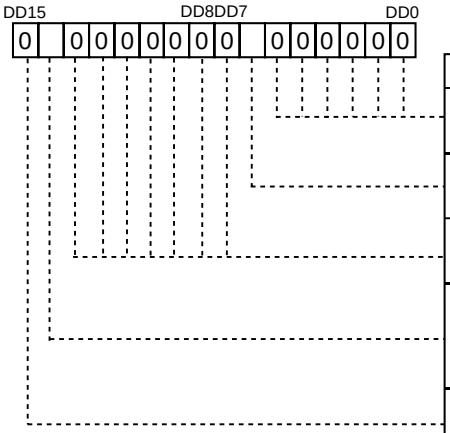
Bit symbol	Bit name	Function	R	W
Reserved bit		Must always be set to "0".	×	○
TEST0	Test bit	Must always be set to "0".	○	○
TEST1			○	○
TEST2			○	○
Reserved bit		Must always be set to "0".	×	○

(4) Address 04$_{16}$ to 0A$_{16}$ (= DA5 to 0)



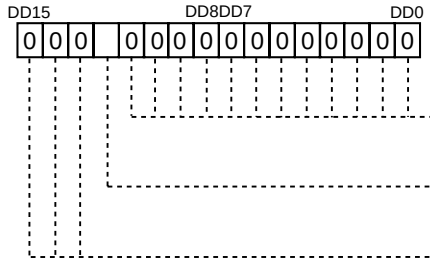
Bit symbol	Bit name	Function	R	W
Reserved bit		Must always be set to "0".	×	○

(5) Address 0B16 (= DA5 to 0)



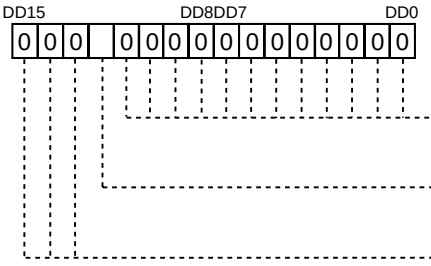
Bit symbol	Bit name	Function		R	W
Reserved bit		Must always be set to "0".		×	○
PTC8	Port P11 output selection bit	0	P11 output	○	○
		1	SLICEON output		
Reserved bit		Must always be set to "0".		×	○
PTD8	Port P11 data selection bit	0	When port output : fixed to "L" when SLICEON output : specified negative polarity	○	○
		1	When port output : fixed to "H" when SLICEON output : specified positive polarity		
Reserved bit		Must always be set to "0".		×	○

(6) Address 0C16 (= DA5 to 0)



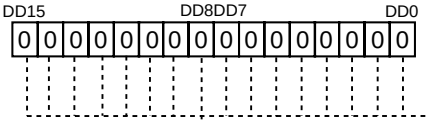
Bit symbol	Bit name	Function		R	W
Reserved bit		Must always be set to "0".		×	○
TIMBAS	Time base selection bit	0	Time base OFF	○	○
		1	Time base ON		
Reserved bit		Must always be set to "0".		×	○

(7) Address 0D16 (= DA5 to 0)



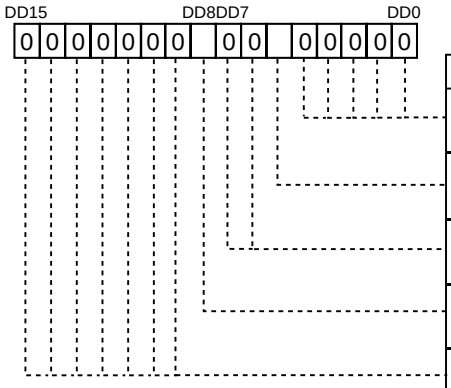
Bit symbol	Bit name	Function		R	W
Reserved bit		Must always be set to "0".		×	○
NXP	Broadcast method selection bit	0	NTSC	○	○
		1	PAL		
Reserved bit		Must always be set to "0".		×	○

(8) Address 0E16 (= DA5 to 0)



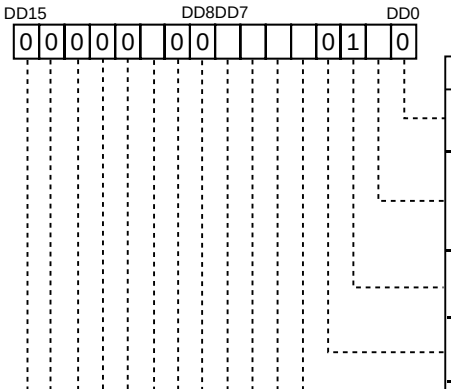
Bit symbol	Bit name	Function	R	W
Reserved bit		Must always be set to "0".	×	○

(9) Address 0F16 (= DA5 to 0)



Bit symbol	Bit name	Function		R	W
Reserved bit		Must always be set to "0".		×	○
SEL_PDCH	PDC clock selection bit	0	Do not set	○	○
		1	Generats PDC clock in based on FSCIN pin input signal.		
Reserved bit		Must always be set to "0".		×	○
ADON	Data acquisition control bit	0	Data acquisition OFF	○	○
		1	Data acquisition ON		
Reserved bit		Must always be set to "0".		×	○

(10) Address 1016 (= DA5 to 0)

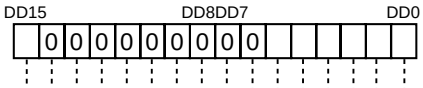


Bit symbol	Bit name	Function		R	W
Reserved bit		Must always be set to "0".		×	○
VPS_SUB	Flaming code check selection bit for VPS data.	0	Later 8bits of flaming code 16bits	○	○
		1	Former 4bits and later 4bits of flaming code 16bits (Select 8bits which is set in VPS_FLC0 to 7)		
Reserved bit		Must always be set to "1".		×	○
Reserved bit		Must always be set to "0".		×	○
SLI_VP0	Acquisition start line selection bit (Field 1 and 2 are common) Stores data for 18 lines from the 6th line,normally. (SLI_VP2 to SLI_VPO = "316" fixed)	If the acquisition start line is SLI_VS, <Field 1> SLI_VS= $\sum_{n=0}^{2} 2^n$SLI_VPn+3 <Field 2> SLI_VS= $\sum_{n=0}^{2} 2^n$SLI_VPn+315 Stores data for 18 lines from line which is set by this register to slice RAM.		○	○
SLI_VP1				○	○
SLI_VP2				○	○
SLSLVL	Acquisition level control bit	0	Auto level for data acquisition	○	○
		1	Fix level for data acquisition		
Reserved bit		Must always be set to "0".		×	○
SYNCSEP_ON0	Synchronous separation control bit	0	Sync-sep circuit OFF	○	○
		1	Sync-sep circuit ON		
Reserved bit		Must always be set to "0".		×	○

(11) Address 11$_{16}$ (= DA5 to 0)

Bit symbol	Bit name	Function	R	W
Reserved bit		Must always be set to "0".	×	○
Reserved bit		Must always be set to "1".	×	○
Reserved bit		Must always be set to "0".	×	○

(12) Address 12$_{16}$ (= DA5 to 0)



Bit symbol	Bit name	Function	R	W
SEKI0	Data acquisition control bit 1	SEKI1 SEKI0 N: 0 0 5; 0 1 4; 1 0 3; 1 1 2	○	○
SEKI1		N times of the digital value after AD is done.	○	○
SEKI2	Data acquisition control bit 2	SEKI3 SEKI2 N: 0 0 4; 0 1 3; 1 0 1; 1 1 Not differentiate	○	○
SEKI3		It is differentiated for digital value after the SEKI0, 1 operation at digital value in the before N/8 period(clock run-in period).	○	○
SEKI4	Data acquisition control bit 3	SEKI5 SEKI4 N: 0 0 4; 0 1 3; 1 0 1; 1 1 Not differentiate	○	○
SEKI5		It is differentiated for digital value after the SEKI3, 2 operation at digital value in the after N/8 period(clock run-in period).	○	○
Reserved bit		Must always be set to "0"	×	○
SEL_VPSH	VPS clock selection bit	0 Do not set; 1 Generats VPS clock in based on FSCIN pin input signal.	○	○

2.15.5 Expansion Register Construction Composition

(1) Acquisition timming

The SLICEON signal is output in the acquisition possible period.

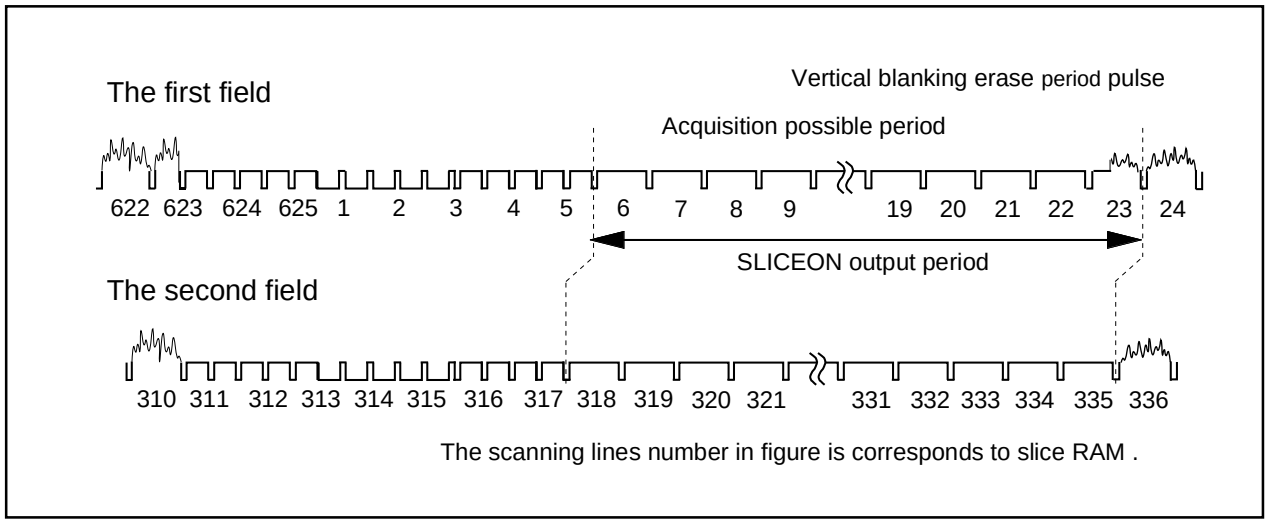

Figure 2.15.7 Acquisition timing

2.15.6 8/4 Humming Decoder

8/4 humming decoder opetates only by written the data which 8/4 humming- decoded to 8/4 humming register (address 021A16). 8/4 humming register consists of 16 bits, can decode two data at a time. Can obtain the decoded result by reading 8/4 humming register, and the decoded value and error information are output. Corrects and outputs the decoded value for single error, and outputs only error information for double error. Decoded result is shown in Figure 2.15.8 and humming 8/4 register composition is shown in Figure 2.15.9.

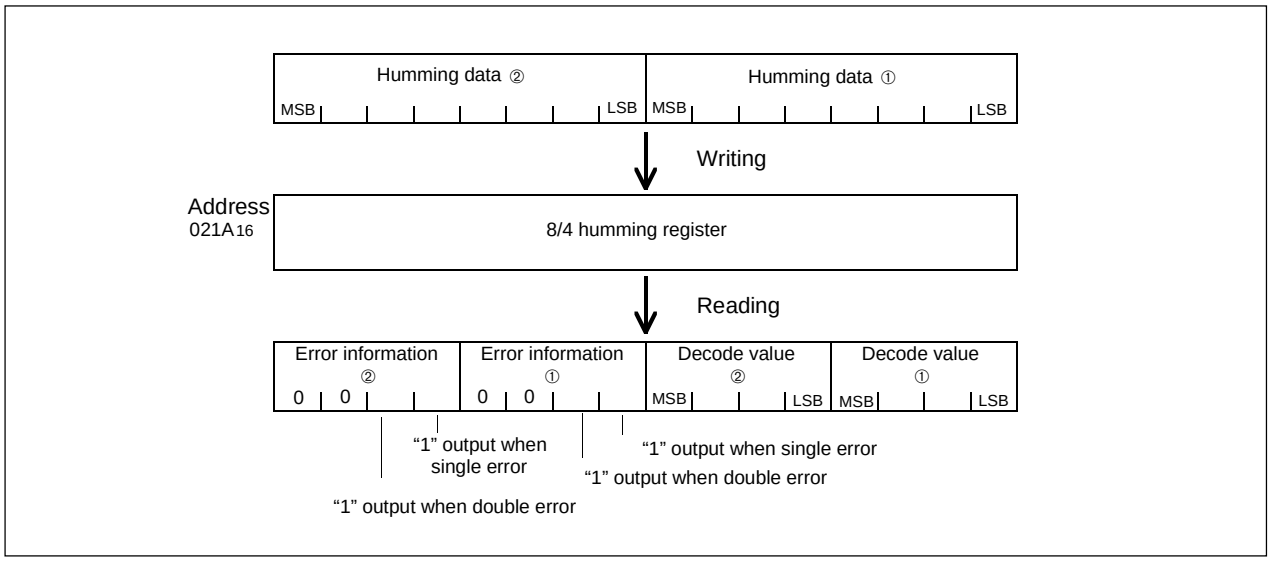

Figure 2.15.8 Decoded result

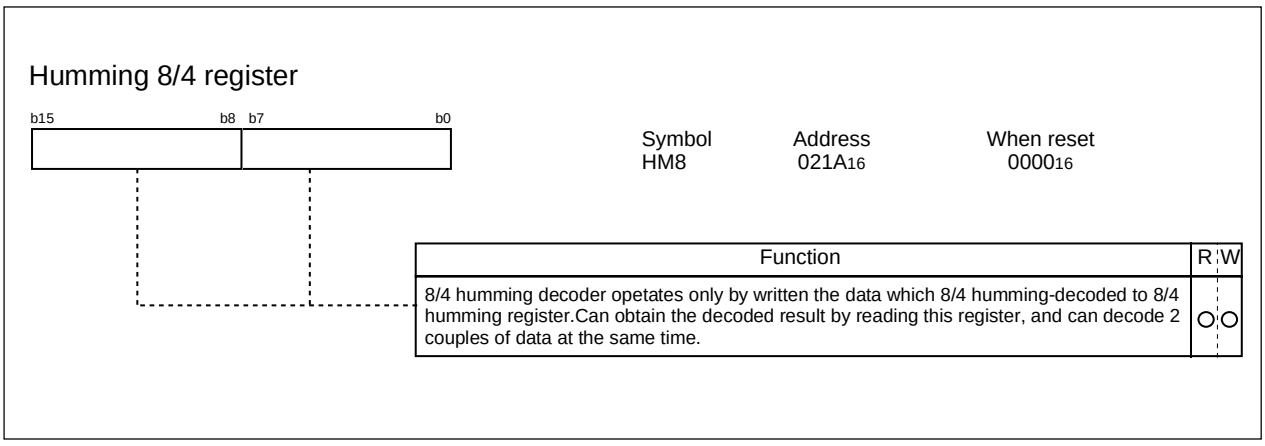

Figure 2.15.9 Humming 8/4 register composition

2.15.7 24/18Humming Decoder

24/18 humming decoder operates only by written the data which 24/18 humming-encoded to 24/18 humming register 0 (address 021C16) and 1 (address 021E16). Can obtain the decoded result by reading the same 24/18 humming register. Decoded result is shown in Figure 2.15.10 and humming 24/18 register composition is shown in Figure 2.15.11.

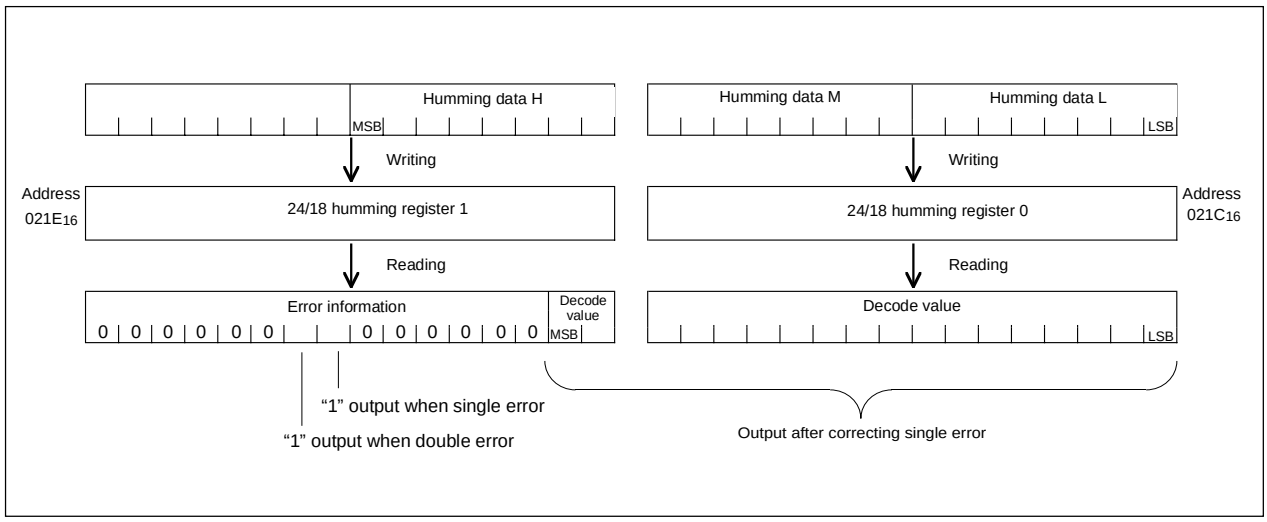

Figure 2.15.10 Decoded result

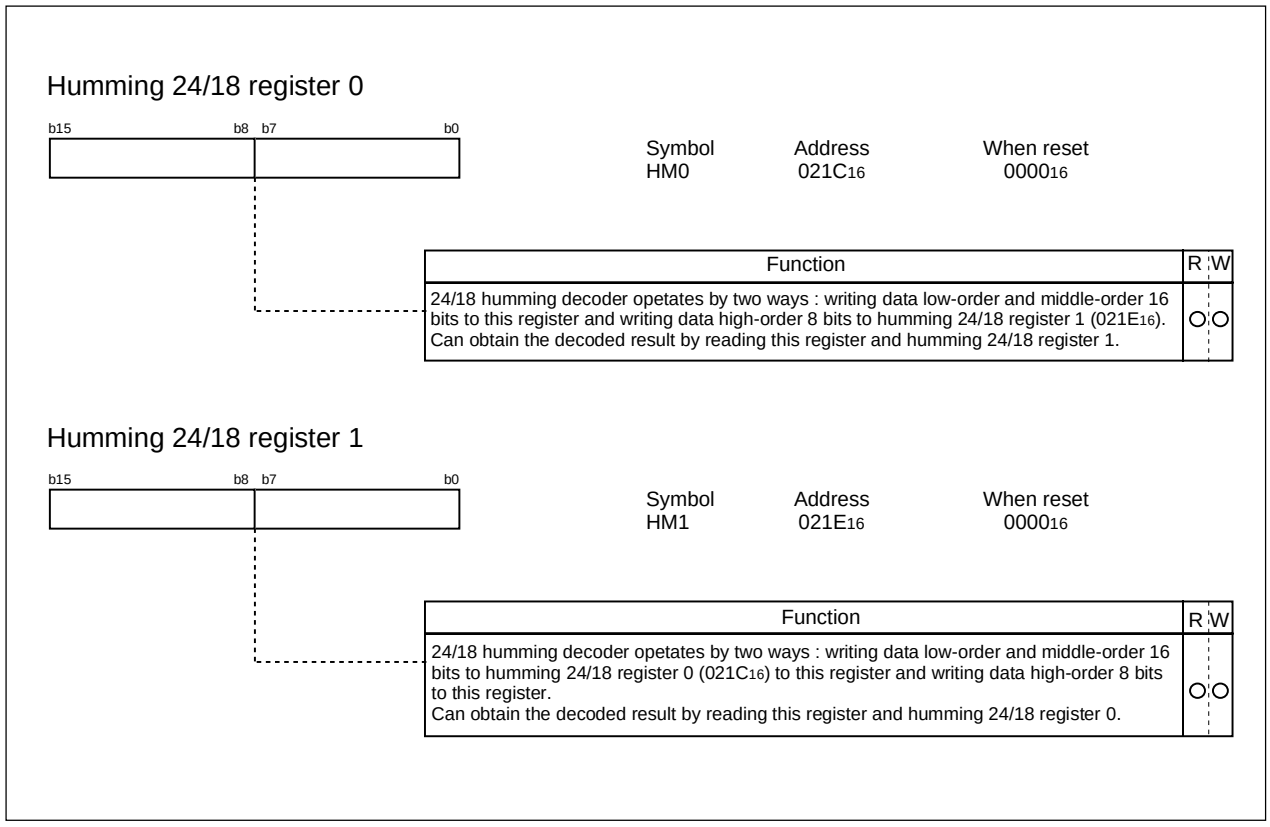

Figure 2.15.11 Humming 24/18 register composition

Continuous error correction

When uses humming 8/4 (address 021A16) at tha same time as humming 24/18, can do the continuous error correction.

Continuous error correction sequence is shown in Figure 2.15.12.

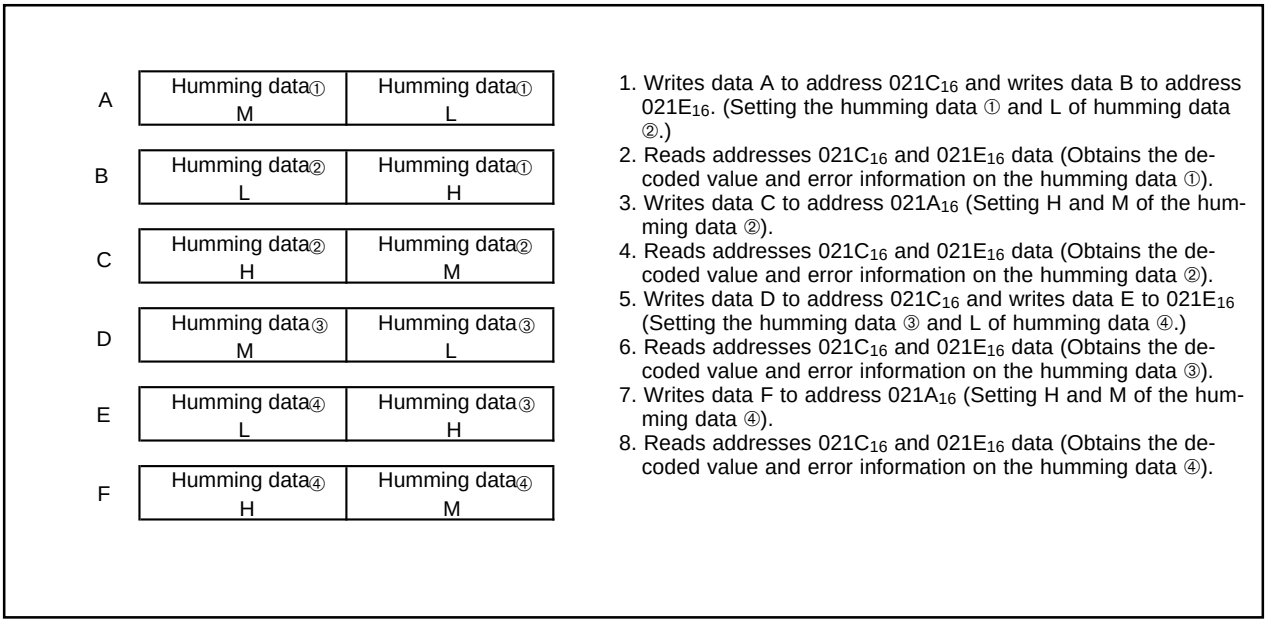

Figure 2.15.12 Continuous error correction sequence

Then, because using a part of circuit of humming 8/4 about this operation, cannot use this operation at the same time.

When using the humming circuit, do the decoded result reading operation at once after the setting data of humming. And do not access other memories (Including the humming circuit) before reading of the decoded result.

2.15.8 I/O Composition of pins for Expansion Memory

Figure 2.15.13 and figure 2.15.14 show pins for expansion memory.

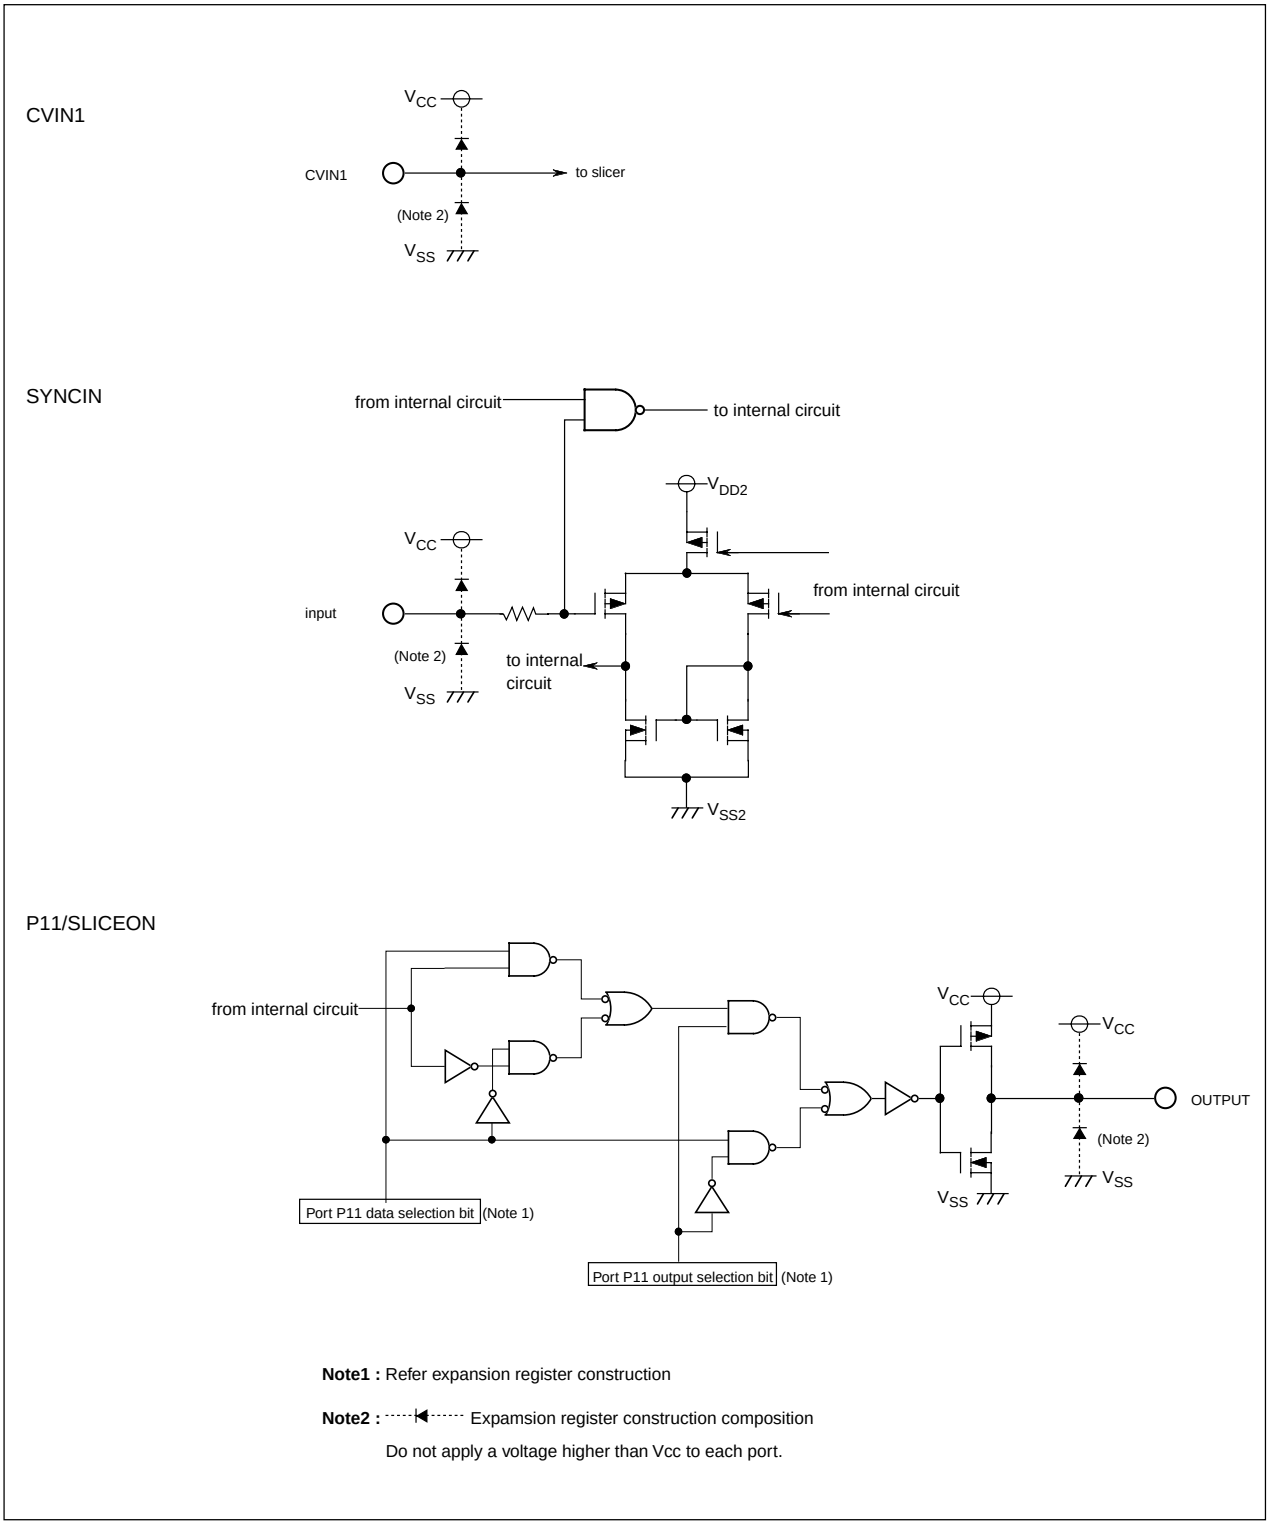

Figure 2.15.13 Pins for expansion memory(1)

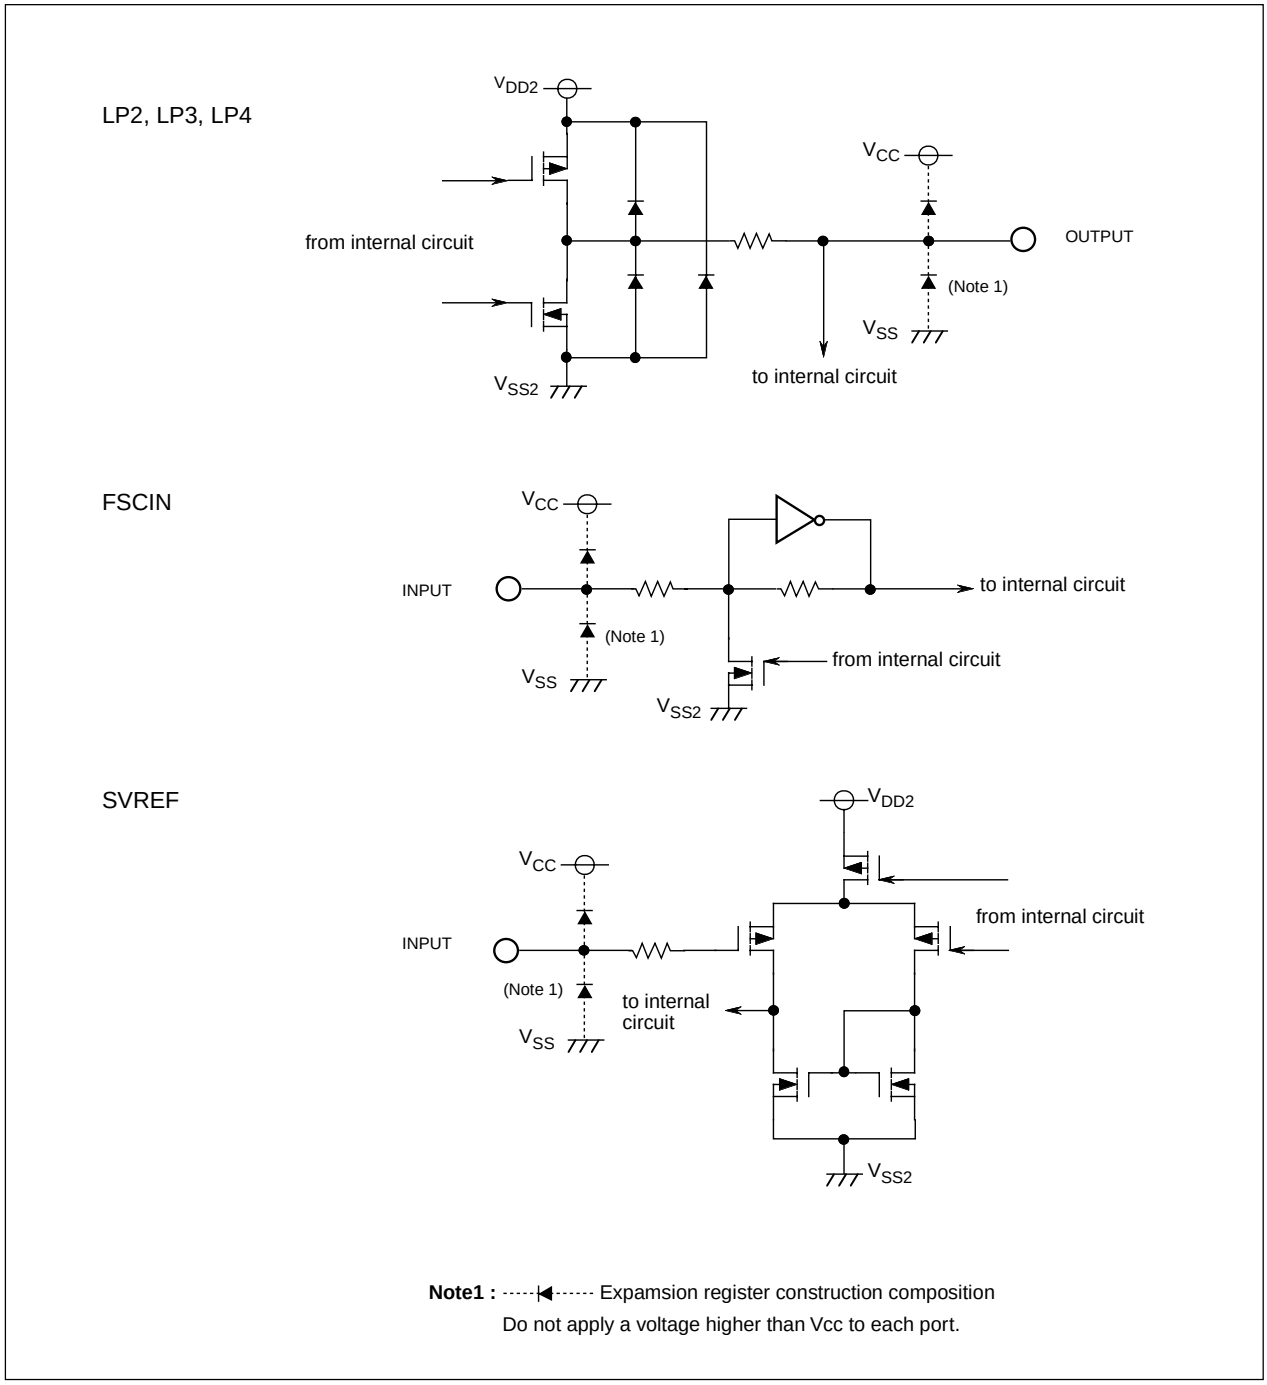

Figure 2.15.14 Pins for expansion memory(2)

2.16 Programmable I/O Ports

There are 87 programmable I/O ports: P0 to P10 (excluding $P8_5$). Each port can be set independently for input or output using the direction register. A pull-up resistance for each block of 4 ports can be set. $P8_5$ is an input-only port and has no built-in pull-up resistance.

Figures 2.16.1 to 2.16.4 show the programmable I/O ports. Figure 2.16.5 shows the I/O pins.

Each pin functions as a programmable I/O port and as the I/O for the built-in peripheral devices.

To use the pins as the inputs for the built-in peripheral devices, set the direction register of each pin to input mode. When the pins are used as the outputs for the built-in peripheral devices (other than the D-A converter), they function as outputs regardless of the contents of the direction registers. When pins are to be used as the outputs for the D-A converter, do not set the direction registers to output mode. See the descriptions of the respective functions for how to set up the built-in peripheral devices.

(1) Direction registers

Figure 2.16.6 shows the direction registers.

These registers are used to choose the direction of the programmable I/O ports. Each bit in these registers corresponds one for one to each I/O pin.

In memory expansion mode, the contents of corresponding direction register of pins A0 to A19, D0 to D15, $\overline{CS0}$ to $\overline{CS3}$, $\overline{RD}$, $\overline{WRL}$/$\overline{WR}$, $\overline{WRH}$/$\overline{BHE}$, ALE, $\overline{RDY}$, $\overline{HOLD}$, $\overline{HLDA}$ and BCLK cannot be modified.

Note: There is no direction register bit for $P8_5$.

(2) Port registers

Figure 2.16.7 shows the port registers.

These registers are used to write and read data for input and output to and from an external device. A port register consists of a port latch to hold output data and a circuit to read the status of a pin. Each bit in port registers corresponds one for one to each I/O pin.

In memory expansion mode, the contents of corresponding port register of pins A0 to A19, D0 to D15, $\overline{CS0}$ to $\overline{CS3}$, $\overline{RD}$, $\overline{WRL}$/$\overline{WR}$, $\overline{WRH}$/$\overline{BHE}$, ALE, $\overline{RDY}$, $\overline{HOLD}$, $\overline{HLDA}$ and BCLK cannot be modified.

(3) Pull-up control registers

Figure 2.16.8 shows the pull-up control registers.

The pull-up control register can be set to apply a pull-up resistance to each block of 4 ports. When ports are set to have a pull-up resistance, the pull-up resistance is connected only when the direction register is set for input.

However, in memory expansion mode, the pull-up control register of P0 to P3, P40 to P43, and P5 is invalid. The contents of register can be changed, but the pull-up resistance is not connected.

(4) Port control register

Figure 2.16.9 shows the port control register.

The bit 0 of port control resister is used to read port P1 as follows:

0 : When port P1 is input port, port input level is read.
When port P1 is output port , the contents of port P1 register is read.

1 : The contents of port P1 register is read always.

In memory expansion mode, this register is valid in the following:

- External bus width is 8 bits.
- Port P1 can be used as a port in multiplexed bus for the entire space.

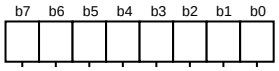
Port control register



Symbpl: PCR
Address: 03FF16
When reset: 0016

Bit symbol	Bit name	Function	R	W
PCR0	Port P1 control register	0 : When input port, read port input level. When output port, read the contents of port P1 register. 1 : Read the contents of port P1 register though input/output port.	○	○
Nothing is assigned. In an attempt to write to these bits, write “0”. The value, if read, turns out to be “0”.			—	—

Figure 2.16.9 Port control register

Table 2.16.1 Example connection of unused pins in single-chip mode

Pin name	Connection
Ports P0 to P10 (excluding P8$_5$)	After setting for input mode, connect every pin to V_{SS} or V_{CC} via a resistor; or after setting for output mode, leave these pins open.
X_{OUT}(Note)	Open
$\overline{NMI}$	Connect via register to V_{CC} (pull-up)
AV_{CC}	Connect to V_{CC}
AV_{SS}, V_{REF}, BYTE	Connect to V_{SS}

Note: With external clock input to X_{IN} pin.

Table 2.16.2 Example connection of unused pins in memory expansion mode

Pin name	Connection
Ports P6 to P10 (excluding P8$_5$)	After setting for input mode, connect every pin to V_{SS} or V_{CC} via a resistor; or after setting for output mode, leave these pins open.
P4$_5$/$\overline{CS1}$ to P4$_7$/$\overline{CS3}$	Sets ports to input mode, sets bits $\overline{CS1}$ through $\overline{CS3}$ to 0, and connects to Vcc via resistors (pull-up).
$\overline{BHE}$, ALE, $\overline{HLDA}$, X_{OUT}(Note1), BCLK(Note2)	Open
$\overline{HOLD}$, $\overline{RDY}$, $\overline{NMI}$	Connect via resistor to V_{CC} (pull-up)
AV_{CC}	Connect to V_{CC}
AV_{SS}, V_{REF}	Connect to V_{SS}

Note 1: With external clock input to X_{IN} pin.
Note 2: When the BCLK output disable bit (bit 7 at address 0004$_{16}$) is set to “1”, connect to V_{CC} via a resistor (pull-up).

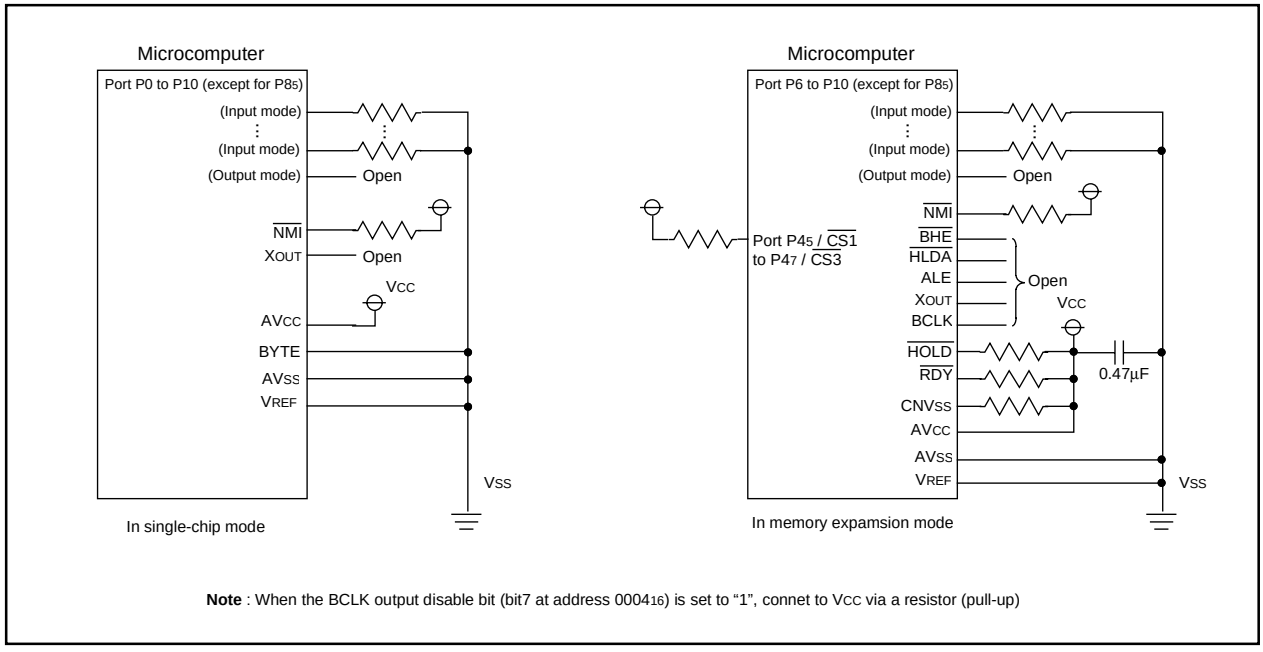


Figure 2.16.10 Example connection of unused pins

3. USAGE PRECAUTION

Timer A (timer mode)

(1) Reading the timer Ai register while a count is in progress allows reading, with arbitrary timing, the value of the counter. Reading the timer Ai register with the reload timing gets "FFFF16". Reading the timer Ai register after setting a value in the timer Ai register with a count halted but before the counter starts counting gets a proper value.

Timer A (event counter mode)

(1) Reading the timer Ai register while a count is in progress allows reading, with arbitrary timing, the value of the counter. Reading the timer Ai register with the reload timing gets "FFFF16" by underflow or "000016" by overflow. Reading the timer Ai register after setting a value in the timer Ai register with a count halted but before the counter starts counting gets a proper value.

(2) When stop counting in free run type, set timer again.

(3) In the case of using "Event counter mode" as "Free-Run type" for timer A, the timer register contents may be unkown when counting begins. If the timer register is set before counting has started, then the starting value will be unkown.

This issue will occuer only for the "Event counter mode" operating as "Free-Run type". The value of the timer register will not be unkown during counting.

Timer A (one-shot timer mode)

(1) Setting the count start flag to "0" while a count is in progress causes as follows:

- The counter stops counting and a content of reload register is reloaded.
- The TAiOUT pin outputs "L" level.
- The interrupt request generated and the timer Ai interrupt request bit goes to "1".

(2) The timer Ai interrupt request bit goes to "1" if the timer's operation mode is set using any of the following procedures:

- Selecting one-shot timer mode after reset.
- Changing operation mode from timer mode to one-shot timer mode.
- Changing operation mode from event counter mode to one-shot timer mode.

Therefore, to use timer Ai interrupt (interrupt request bit), set timer Ai interrupt request bit to "0" after the above listed changes have been made.

Timer A (pulse width modulation mode)

(1) The timer Ai interrupt request bit becomes "1" if setting operation mode of the timer in compliance with any of the following procedures:

- Selecting PWM mode after reset.
- Changing operation mode from timer mode to PWM mode.
- Changing operation mode from event counter mode to PWM mode.

Therefore, to use timer Ai interrupt (interrupt request bit), set timer Ai interrupt request bit to "0" after the above listed changes have been made.

(2) Setting the count start flag to "0" while PWM pulses are being output causes the counter to stop counting. If the TAiOUT pin is outputting an "H" level in this instance, the output level goes to "L", and the timer Ai interrupt request bit goes to "1". If the TAiOUT pin is outputting an "L" level in this instance, the level does not change, and the timer Ai interrupt request bit does not becomes "1".

Timer B (timer mode, event counter mode)

(1) Reading the timer Bi register while a count is in progress allows reading , with arbitrary timing, the value of the counter. Reading the timer Bi register with the reload timing gets "FFFF16". Reading the timer Bi register after setting a value in the timer Bi register with a count halted but before the counter starts counting gets a proper value.

Timer B (pulse period/pulse width measurement mode)

(1) If changing the measurement mode select bit is set after a count is started, the timer Bi interrupt request bit goes to "1".
(2) When the first effective edge is input after a count is started, an indeterminate value is transferred to the reload register. At this time, timer Bi interrupt request is not generated.

A-D Converter

(1) Write to each bit (except bit 6) of A-D control register 0, to each bit of A-D control register 1, and to bit 0 of A-D control register 2 when A-D conversion is stopped (before a trigger occurs).
In particular, when the Vref connection bit is changed from "0" to "1", start A-D conversion after an elapse of 1 µs or longer.
(2) When changing A-D operation mode, select analog input pin again.
(3) Using one-shot mode or single sweep mode
Read the correspondence A-D register after confirming A-D conversion is finished. (It is known by A-D conversion interrupt request bit.)
(4) Using repeat mode, repeat sweep mode 0 or repeat sweep mode 1
Use the undivided main clock as the internal CPU clock.

Stop Mode and Wait Mode

(1) When returning from stop mode by hardware reset, $\overline{\text{RESET}}$ pin must be set to "L" level until main clock oscillation is stabilized.
(2) When switching to either wait mode or stop mode, instructions occupying four bytes either from the WAIT instruction or from the instruction that sets the every-clock stop bit to "1" within the instruction queue are prefetched and then the program stops. So put at least four NOPs in succession either to the WAIT instruction or to the instruction that sets the every-clock stop bit to "1".
(3) When the MCU running in low-speed or low power dissipation mode, do not enter WAIT mode with WAIT periphheral function clock stop bit set to "1".

Interrupts

(1) Reading address 00000$_{16}$
• When maskable interrupt is occurred, CPU read the interrupt information (the interrupt number and interrupt request level) in the interrupt sequence.
The interrupt request bit of the certain interrupt written in address 00000$_{16}$ will then be set to "0".
Reading address 00000$_{16}$ by software sets enabled highest priority interrupt source request bit to "0".
Though the interrupt is generated, the interrupt routine may not be executed.
Do not read address 00000$_{16}$ by software.
(2) Setting the stack pointer
• The value of the stack pointer immediately after reset is initialized to 0000$_{16}$. Accepting an interrupt before setting a value in the stack pointer may become a factor of runaway. Be sure to set a value in the stack pointer before accepting an interrupt.
When using the $\overline{\text{NMI}}$ interrupt, initialize the stack point at the beginning of a program. Concerning the first in struction immediately after reset, generating any interrupts including the $\overline{\text{NMI}}$ interrupt is prohib ited.

(3) The $\overline{NMI}$ interrupt

- As for the $\overline{NMI}$ interrupt pin, an interrupt cannot be disabled. Connect it to the V_{CC} pin via a resistor (pull-up) if unused. Be sure to work on it.
- Do not get either into stop mode with the $\overline{NMI}$ pin set to "L".

(4) External interrupt

- When the polarity of the $\overline{INT0}$ to $\overline{INT5}$ pins is changed, the interrupt request bit is sometimes set to "1". After changing the polarity, set the interrupt request bit to "0".

(5) Rewrite the interrupt control register

- To rewrite the interrupt control register, do so at a point that does not generate the interrupt request for that register. If there is possibility of the interrupt request occur, rewrite the interrupt control register after the interrupt is disabled. The program examples are described as follow:

Example 1:

```
INT_SWITCH1:
    FCLR    I               ; Disable interrupts.
    AND.B   #00h, 0055h     ; Clear TA0IC int. priority level and int. request bit.
    NOP                     ; Four NOP instructions are required when using HOLD function.
    NOP
    FSET    I               ; Enable interrupts.
```

Example 2:

```
INT_SWITCH2:
    FCLR    I               ; Disable interrupts.
    AND.B   #00h, 0055h     ; Clear TA0IC int. priority level and int. request bit.
    MOV.W   MEM, R0         ; Dummy read.
    FSET    I               ; Enable interrupts.
```

Example 3:

```
INT_SWITCH3:
    PUSHC   FLG             ; Push Flag register onto stack
    FCLR    I               ; Disable interrupts.
    AND.B   #00h, 0055h     ; Clear TA0IC int. priority level and int. request bit.
    POPC    FLG             ; Enable interrupts.
```

The reason why two NOP instructions (four when using the HOLD function) or dummy read are inserted before FSET I in Examples 1 and 2 is to prevent the interrupt enable flag I from being set before the interrupt control register is rewritten due to effects of the instruction queue.

- When a instruction to rewrite the interrupt control register is executed but the interrupt is disabled, the interrupt request bit is not set sometimes even if the interrupt request for that register has been gener ated. This will depend on the instruction. If this creates problems, use the below instructions to change the register.

  Instructions : AND, OR, BCLR, BSET

Electric Characteristic Differences Between Mask ROM and Flash Memory Version MCUs

There are differences in electric characteristics, operation margin, noise immunity, and noise radiation between Mask ROM and Flash Memory version MCUs due to the difference in the manufacturing processes.

When manufacturing an application system with the Flash Memory version and then switching to use of the Mask ROM version, please perform sufficient evaluations for the commercial samples of the Mask ROM version.

Other Notes

(1) Timing of power supplying

The power need to supply to V_{CC}, $V_{DD}1$, $V_{DD}2$, $V_{DD}3$ and AV_{CC} at a time. While operating, must set same voltage.

(2) Power supply noise and latch-up

In order to avoid power supply noise and latch-up, connect a bypass capacitor (more than 0.1μF) directly between the V_{CC} pin and V_{SS} pin, V_{DD1} pin and V_{SS1} pin, V_{DD2} pin and V_{SS2} pin, V_{DD3} pin and V_{SS3} pin, AV_{CC} pin and AV_{SS} pin using a heavy wire.

(3) When oscillation circuit stop for data slicer

Expansion register XTAL-VCO, PDC_VCO_ON,VPS_VCO_ON is set at “L”, when the data slicer is not used, and the oscillation is stopped. When starting oscillation again, set data at the folowing order.

(a) Set expansion register XTAL-VCO = “H”.
(b) Set expansion register PDC_VCO_ON,VPS_VCO_ON = “H”.
(c) 60 ms or more is a waiting state (stability period of internal oscillation circuit + data slice preparation).

To operate slice RAM , set expansion register XTAL_VCO = “H”. And input 4.43 MHz sub carrier frequency clock from the FSCIN pin.

Access the memories after wating for 20 ms certainly when resuming synchronous oscillation from the off state , and begin to input clock into the FSCIN pin.

(4) At stop mode (clock is stopped)

Set each input pins to as follows.

(a) Set M1 pin = V_{SS}.
(b) Stop the FSCIN pin input.
(c) Set expansion register STBY0 and STBY1 = “H”.
Set all expansion registers to “L” except for the superscription register.

(5) When operation start from stand-by mode (clock is stopped)

Input FSCIN pin clock after set “L” to register STBY0 and STBY1.
At next, set expansion register as notes (3).

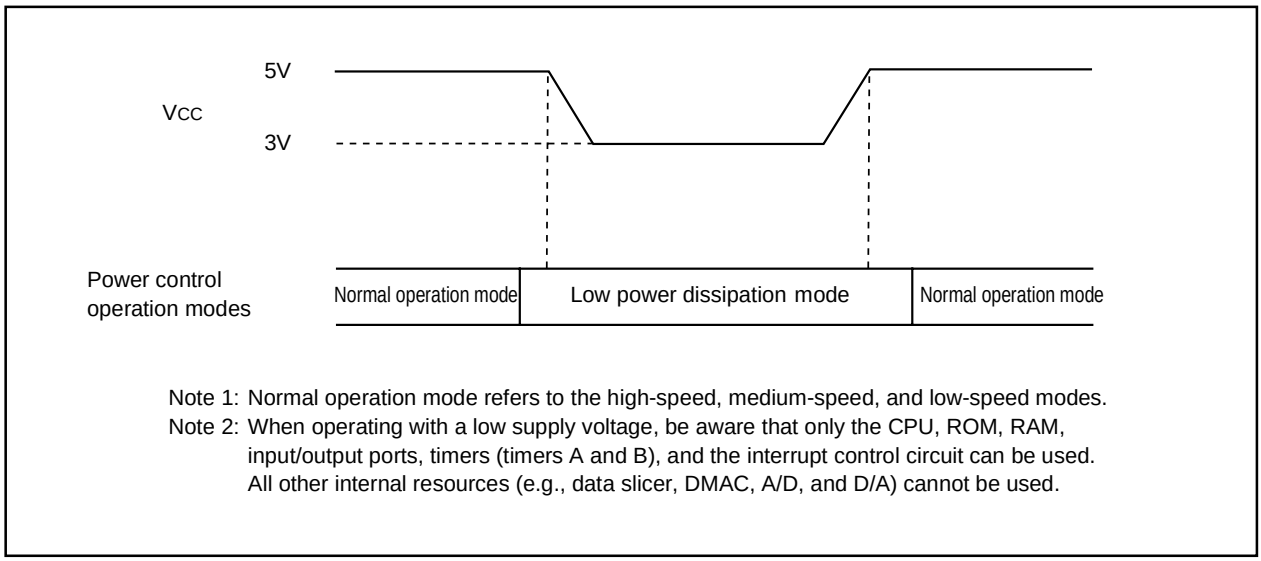
(6) Notes on operating with a low supply voltage (V_{CC} = 3.0 V)

When in single-chip mode, this product can operate with a low supply voltage (V_{CC} = 3.0 V) only during low power dissipation mode. Before operating with a low supply voltage, always be sure to set the relevant register bits to select low power dissipation mode (BCLK : f(X_{CIN}), main clock X_{IN} : stop, subclock X_{CIN} : oscillating). Then reduce the power supply voltage V_{CC} to 3.0 V.

Also, when returning to normal operation, raise the power supply voltage to 5V while in low power consumption mode before entering normal operation mode.

When moving from any operation mode to another, make sure a state transition occurs according to the state transition diagram (Figure 2.5.5) in Section 2.5.7, "Power control."

The status of the power supply voltage VCC during operation mode transition is shown in Figure 3.1 below.



Note 1: Normal operation mode refers to the high-speed, medium-speed, and low-speed modes.
Note 2: When operating with a low supply voltage, be aware that only the CPU, ROM, RAM, input/output ports, timers (timers A and B), and the interrupt control circuit can be used. All other internal resources (e.g., data slicer, DMAC, A/D, and D/A) cannot be used.

Figure 3.1 Status of the power supply voltage VCC during operation mode transition

4. ELECTRICAL CHARACTERISTICS

Table 4.1 Absolute maximum ratings

Symbol	Parameter		Condition	Rated value	Unit
V_{CC}	Supply voltage		V_{CC}=AV$_{CC}$	-0.3 to 5.75	V
AVcc	Analog supply voltage		V_{CC}=AV$_{CC}$	-0.3 to 5.75	V
M2	Supply voltage for program/erase			-0.3 to 5.75	V

Table 4.5 Electrical characteristics (referenced to Vcc = 5V, Vss = 0V at Ta = 25°C unless otherwise specified)

Symbol	Parameter	Measuring condition	Standard			Unit
			Min	Typ.	Max.	
R_{fXIN}	Feedback resistance XIN			1.0		MΩ
R_{fXCIN}	Feedback resistance XCIN			6.0		MΩ
V_{RAM}	RAM retention voltage	When clock is stopped	2.0			V
I_{cc}	Power supply current	At the time of slicer operation f(XCIN)=10kHz		150	180	mA
		Vcc=5.0V f(XCIN)=32kHz A rectangular wave (Notes 1, 2)		200		µA
		Vcc=3.0V f(XCIN)=32kHz A rectangular wave (Notes 1, 2)		150		µA
		Vcc=5.0V f(XCIN)=32kHz At the time of weight (Notes 1, 2)		5.0	10.0	µA
		Vcc=3.0V f(XCIN)=32kHz At the time of weight (Notes 1, 2)		3.0	8.0	µA
		At the time of a clock stop (Notes 2)			5.0	µA

Note 1: This is a state where only one timer is operating with fc32 while the oscillation capability is set to LOWand slicer operation is turned OFF.

Note 2: • VDD1, VDD2, and VDD3 all are at the same potential level as Vcc.
- Extension register (address 00_{16} DD8) STBY0 and (address 15_{16} DD13) STBY1 are set to 1 while all other extension registers (addresses 00_{16} through 22_{16}) are set to 0.
- Clock input to the FSCIN pin is disabled.
- Inputs to the SYNCIN and CVIN1 pins are disabled.

Tabl 4.6 Video signal input conditions (Vcc = 5.0V, Ta = –20 to 70°C)

Symbol	Parameter	Measuring condition	Standard			Unit
			Min	Typ.	Max.	
V_{IN-cu}	Composite video signal input clamp voltage	Sync-chip voltage		1.0		V

Table 4.7 A-D conversion characteristics (referenced to V_{CC} = AV_{CC} = V_{REF} = 5V, V_{SS} = AV_{SS} = 0V at Ta = 25°C, f(X_{IN}) = 10MHz unless otherwise specified)

Symbol	Parameter		Measuring condition	Standard			Unit
				Min.	Typ.	Max.	
–	Resolution		V_{REF} = V_{CC}			8	Bits
–	Absolute accuracy	Sample & hold function not available	V_{REF} = V_{CC} = 5V			±3	LSB
		Sample & hold function available(8bit)	V_{REF} = V_{CC} = 5V			±2	LSB
R_{LADDER}	Ladder resistance		V_{REF} = V_{CC}	10		40	kΩ
t_{CONV}	Conversion time(8bit)			2.8			µs
t_{SAMP}	Sampling time			0.3			µs
V_{REF}	Reference voltage			2		V_{CC}	V
V_{IA}	Analog input voltage			0		V_{REF}	V

Table 4.8 D-A conversion characteristics (referenced to V_{CC} = 5V, V_{SS} = AV_{SS} = 0V, V_{REF} = 5V at Ta = 25°C, f(X_{IN}) = 10MHz unless otherwise specified)

Symbol	Parameter	Measuring condition	Standard			Unit
			Min.	Typ.	Max.	
–	Resolution				8	Bits
–	Absolute accuracy				1.0	%
t_{su}	Setup time				3	µs
R_O	Output resistance		4	10	20	kΩ
I_{VREF}	Reference power supply input current	(Note)			1.5	mA

Note: This applies when using one D-A converter, with the D-A register for the unused D-A converter set to "00_{16}".
The A-D converter's ladder resistance is not included.
Also, when the Vref is unconnected at the A-D control register, I_{VREF} is sent.

Timing requirements (referenced to V_{CC} = 5V, V_{SS} = 0V at Ta = 25°C unless otherwise specified)

Table 4.9 External clock input

Symbol	Parameter	Standard		Unit
		Min.	Max.	
t_c	External clock input cycle time	100		ns
$t_{w(H)}$	External clock input HIGH pulse width	40		ns
$t_{w(L)}$	External clock input LOW pulse width	40		ns
t_r	External clock rise time		18	ns
t_f	External clock fall time		18	ns

Table 4.10 In memory expansion mode

Symbol	Parameter	Standard		Unit
		Min.	Max.	
$t_{ac1(RD-DB)}$	Data input access time (no wait)		(Note)	ns
$t_{ac2(RD-DB)}$	Data input access time (with wait)		(Note)	ns
$t_{ac3(RD-DB)}$	Data input access time (when accessing multiplex bus area)		(Note)	ns
$t_{su(DB-RD)}$	Data input setup time	40		ns
$t_{su(RDY-BCLK)}$	$\overline{RDY}$ input setup time	30		ns
$t_{su(HOLD-BCLK)}$	$\overline{HOLD}$ input setup time	40		ns
$t_{h(RD-DB)}$	Data input hold time	0		ns
$t_{h(BCLK-RDY)}$	$\overline{RDY}$ input hold time	0		ns
$t_{h(BCLK-HOLD)}$	$\overline{HOLD}$ input hold time	0		ns
$t_{d(BCLK-HLDA)}$	$\overline{HLDA}$ output delay time		40	ns

Note: Calculated according to the BCLK frequency as follows:

$$t_{ac1(RD-DB)} = \frac{10^9}{f(BCLK) \times 2} - 45 \quad [ns]$$

$$t_{ac2(RD-DB)} = \frac{3 \times 10^9}{f(BCLK) \times 2} - 45 \quad [ns]$$

$$t_{ac3(RD-DB)} = \frac{3 \times 10^9}{f(BCLK) \times 2} - 45 \quad [ns]$$

$t_{h(WR-AD)}$	Address output hold time (WR standard)		0		ns
$t_{d(BCLK-CS)}$	Chip select output delay time			40	ns
$t_{h(BCLK-CS)}$	Chip select output hold time (BCLK standard)		4		ns
$t_{d(BCLK-ALE)}$	ALE signal output delay time			40	ns
$t_{h(BCLK-ALE)}$	ALE signal output hold time		– 4		ns
$t_{d(BCLK-RD)}$	RD signal output delay time			40	ns
$t_{h(BCLK-RD)}$	RD signal output hold time		0		ns
$t_{d(BCLK-WR)}$	WR signal output delay time			40	ns
$t_{h(BCLK-WR)}$	WR signal output hold time		0		ns
$t_{d(BCLK-DB)}$	Data output delay time (BCLK standard)			40	ns
$t_{h(BCLK-DB)}$	Data output hold time (BCLK standard)		4		ns
$t_{d(DB-WR)}$	Data output delay time (WR standard)		(Note1)		ns
$t_{h(WR-DB)}$	Data output hold time (WR standard)(Note2)		0		ns

Note 1: Calculated according to the BCLK frequency as follows:

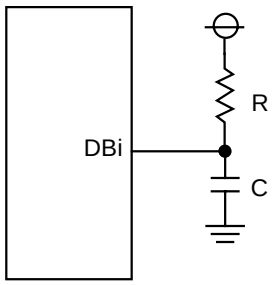
$$td(DB - WR) = \frac{10^9}{f(BCLK) \times 2} - 40 \quad [ns]$$

Note 2: This is standard value shows the timing when the output is off, and doesn't show hold time of data bus.
Hold time of data bus is different by capacitor volume and pull-up (pull-down) resistance value.
Hold time of data bus is expressed in

$$t = -CR \times \ln (1 - V_{OL} / V_{CC})$$

by a circuit of the right figure.
For example, when $V_{OL} = 0.2V_{CC}$, C = 30pF, R = 1kΩ, hold time of output "L" level is

$$t = -30pF \times 1k\Omega \times \ln (1 - 0.2V_{CC} / V_{CC})$$
$$= 6.7ns.$$



Switching characteristics (refer to V_{CC} = 5V, V_{SS} = 0V at Ta = 25°C, CM15 = "1" unless otherwise specified)

5. FLASH MEMORY

5.1 Outline Performance

Table 5.1.1 shows the outline performance of the M306H2FCFP (flash memory version).

Table 5.1.1. Outline performance of the M306H2FCFP (flash memory version)

Item		Performance
Power supply voltage		4.75V to 5.25 V (at f(X_{IN}) = 10 MHz)
Program/erase voltage		4.75V to 5.25 V (f(X_{IN}) = 10 MHz, No wait, f(X_{IN}) = 5 MHz, One wait)
Flash memory operation mode		Three modes (parallel I/O, standard serial I/O, CPU rewrite)
Erase block division	User ROM area	Refer to Figure 5.2.1
	Boot ROM area	No division (8 K bytes) (Note 1)
Program method		In units of words
Erase method		Collective erase/block erase
Program/erase control method		Program/erase control by software command
Number of commands		6 commands
Program/erase count		100 times
ROM code protect		Parallel I/O and standard serial I/O modes are supported.

Note : The boot ROM area contains a standard serial I/O mode control program which is stored in it when shipped from the factory. This area can be erased and programmed in only parallel I/O mode.

5.2 Flash Memory mode

The M306H2FCFP (flash memory version) has an internal new DINOR (DIvided bit line NOR) flash memory that can be rewritten with a single power source.

For this flash memory, three flash memory modes are available in which to read, program, and erase: parallel I/O and standard serial I/O modes in which the flash memory can be manipulated using a programmer and a CPU rewrite mode in which the flash memory can be manipulated by the Central Processing Unit (CPU). Each mode is detailed in the pages to follow.

The flash memory is divided into several blocks as shown in Figure 5.2.1, so that memory can be erased one block at a time.

In addition to the ordinary user ROM area to store a microcomputer operation control program, the flash memory has a boot ROM area that is used to store a program to control rewriting in CPU rewrite and standard serial I/O modes. This boot ROM area has had a standard serial I/O mode control program stored in it when shipped from the factory. However, the user can write a rewrite control program in this area that suits the user's application system. This boot ROM area can be rewritten in only parallel I/O mode.

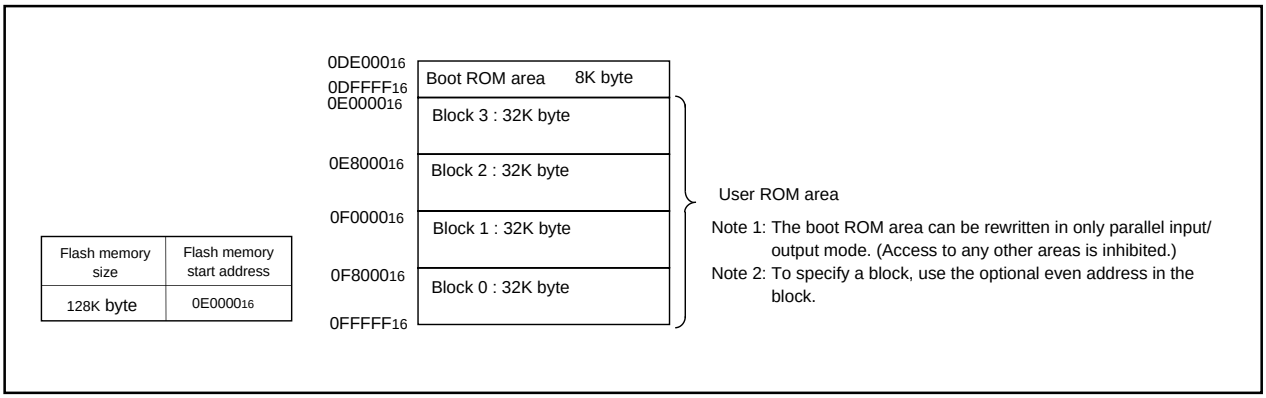

Figure 5.2.1. Block diagram of flash memory version

5.3 CPU Rewrite Mode

In CPU rewrite mode, the on-chip flash memory can be operated on (read, program, or erase) under control of the Central Processing Unit (CPU).

In CPU rewrite mode, only the user ROM area shown in Figure 5.2.1 can be rewritten; the boot ROM area cannot be rewritten. Make sure the program and block erase commands are issued for only the user ROM area and each block area.

The control program for CPU rewrite mode can be stored in either user ROM or boot ROM area. In the CPU rewrite mode, because the flash memory cannot be read from the CPU, the rewrite control program must be transferred to any area other than the internal flash memory before it can be executed.

(1) Microcomputer Mode and Boot Mode

The control program for CPU rewrite mode must be written into the user ROM or boot ROM area in parallel I/O mode beforehand. (If the control program is written into the boot ROM area, the standard serial I/O mode becomes unusable.)

See Figure 5.2.1 for details about the boot ROM area.

Normal microcomputer mode is entered when the microcomputer is reset with pulling CNV_{SS} pin low. In this case, the CPU starts operating using the control program in the user ROM area.

When the microcomputer is reset by pulling the M1 pin low, the CNV_{SS} pin high, the $P5_0$ pin high, the CPU starts operating using the control program in the boot ROM area (program start address is $DE000_{16}$ fixation). This mode is called the “boot” mode.

(2) Block Address

Block addresses refer to the optional even address of each block. These addresses are used in the block erase command.

5.3.1 Outline Performance (CPU Rewrite Mode)

In the CPU rewrite mode, the CPU erases, programs and reads the internal flash memory as instructed by software commands. This rewrite control program must be transferred to internal RAM before it can be excuted.

The CPU rewrite mode is accessed by applying 5V ± 5% to the M2 pin and writing “1” for the CPU rewrite mode select bit (bit 1 in address $03B4_{16}$). Software commands are accepted once the mode is accessed.

In the CPU rewrite mode, write to and read from software commands and data into even-numbered address (“0” for byte address A0) in 16-bit units. Always write 8-bit software commands into even-numbered address. Commands are ignored with odd-numbered addresses.

Use software commands to control program and erase operations. Whether a program or erase operation has terminated normally or in error can be verified by reading the status register.

Figure 5.3.1 shows the flash memory control register.

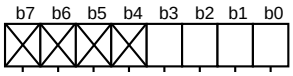
Bit 0 is the RY/$\overline{BY}$ status flag used exclusively to read the operating status of the flash memory. During programming and erase operations, it is “0”. Otherwise, it is “1”.

Bit 1 is the CPU rewrite mode select bit. When this bit is set to “1” and 5V ± 5% are applied to the M2 pin, the M306H2 accesses the CPU rewrite mode. Software commands are accepted once the mode is accessed. In CPU rewrite mode, the CPU becomes unable to access the internal flash memory directly. Therefore, use the control program in RAM for write to bit 1. To set this bit to “1”, it is necessary to write “0” and then write “1” in succession. The bit can be set to “0” by only writing a “0” .

Bit 2 is the CPU rewrite mode entry flag. This bit can be read to check whether the CPU rewrite mode has been entered or not.

Bit 3 is the flash memory reset bit used to reset the control circuit of the internal flash memory. This bit is used when exiting CPU rewrite mode and when flash memory access has failed. When the CPU rewrite mode select bit is “1”, writing “1” for this bit resets the control circuit. To release the reset, it is necessary to set this bit to “0”. If the control circuit is reset while erasing is in progress, a 5 ms wait is needed so that the flash memory can restore normal operation. Figure 5.3.2 shows a flowchart for setting/releasing the CPU rewrite mode.

Flash memory control register

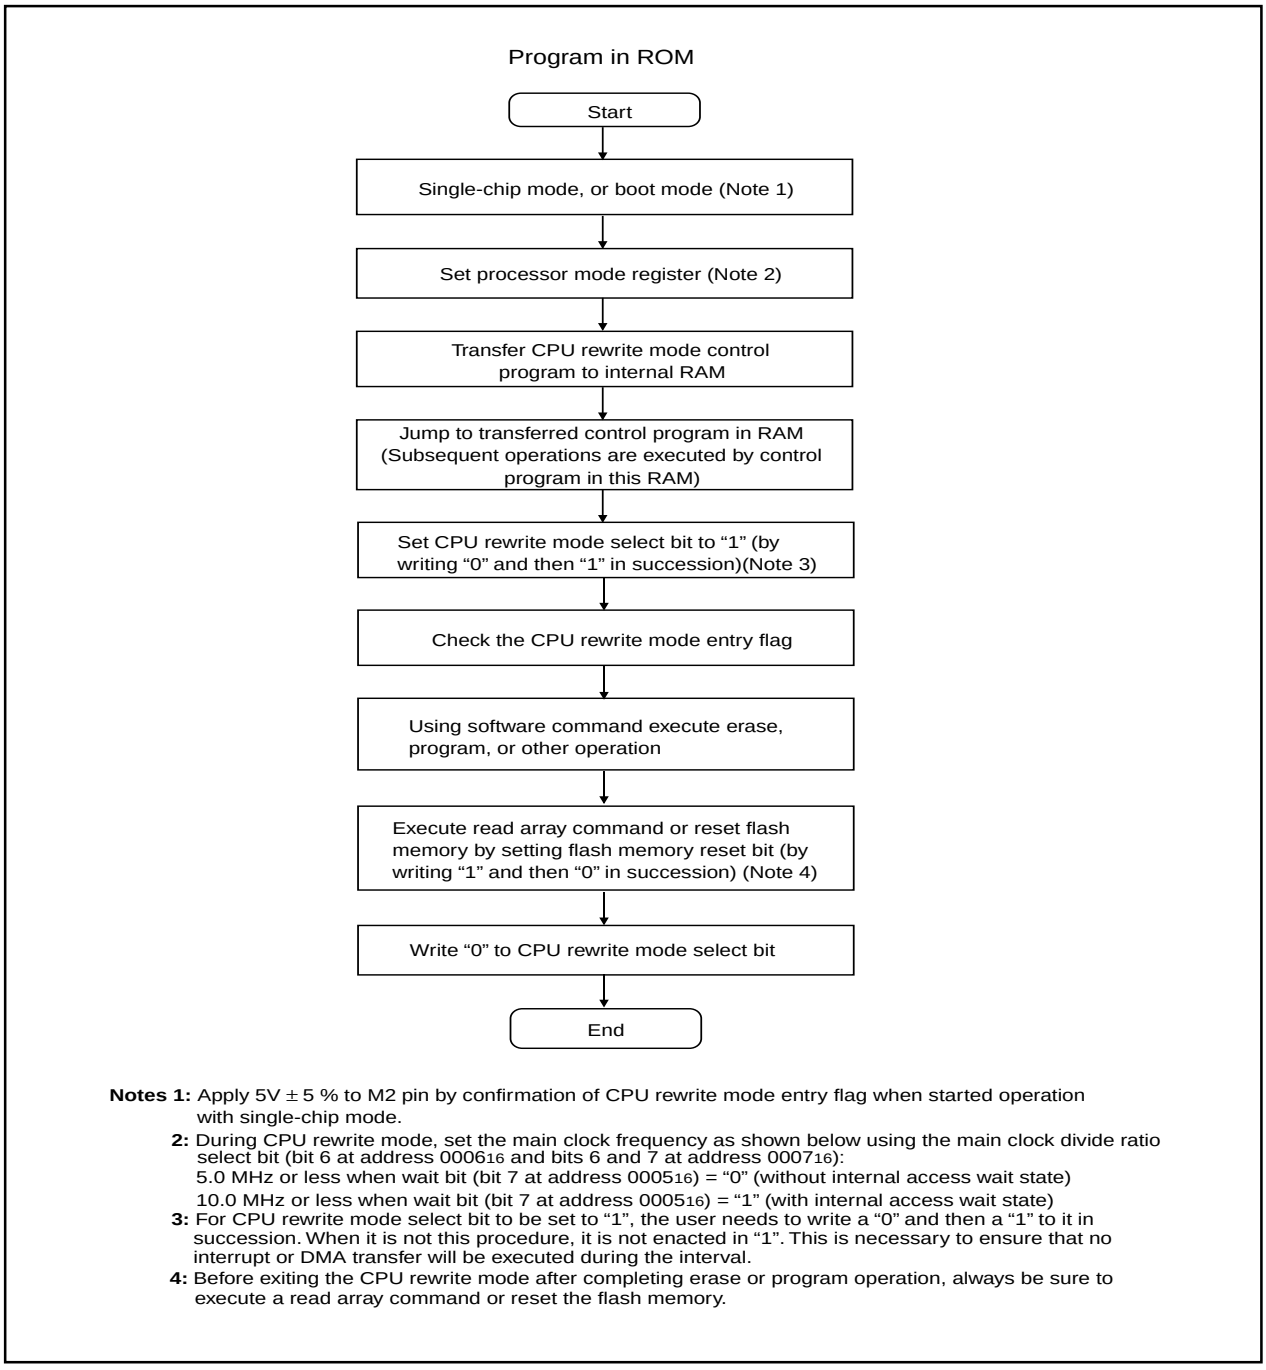


Symbol	Address	When reset
FMCR	$03B4_{16}$	$XXXX0001_2$

Bit symbol	Bit name	Function	R	W
FMCR0	RY/$\overline{BY}$ status flag	0: Busy (being written or erased) 1: Ready	○	—
FMCR1	CPU rewrite mode select bit (Note 1)	0: Normal mode (Software commands invalid) 1: CPU rewrite mode	○	○
FMCR2	CPU rewrite mode entry flag	0: Normal mode (Software commands invalid) 1: CPU rewrite mode (Software commands acceptable)	○	—
FMCR3	Flash memory reset bit (Note 2)	0: Normal operation 1: Reset	○	○
Nothing is assigned. When write, set "0". When read, values are indeterminate.			—	—

Note 1: For this bit to be set to “1”, the user needs to write a “0” and then a “1” to it in succession. When it is not this procedure, it is not enacted in “1”. This is necessary to ensure that no interrupt or DMA transfer will be executed during the interval. Use the control program in the RAM for write to this bit.
Note 2: Effective only when the CPU rewrite mode select bit = 1. Set this bit to 0 subsequently after setting it to 1 (reset).

Figure 5.3.1. Flash memory control registers



Notes 1: Apply 5V ± 5 % to M2 pin by confirmation of CPU rewrite mode entry flag when started operation with single-chip mode.

2: During CPU rewrite mode, set the main clock frequency as shown below using the main clock divide ratio select bit (bit 6 at address 0006_{16} and bits 6 and 7 at address 0007_{16}):
5.0 MHz or less when wait bit (bit 7 at address 0005_{16}) = “0” (without internal access wait state)
10.0 MHz or less when wait bit (bit 7 at address 0005_{16}) = “1” (with internal access wait state)

3: For CPU rewrite mode select bit to be set to “1”, the user needs to write a “0” and then a “1” to it in succession. When it is not this procedure, it is not enacted in “1”. This is necessary to ensure that no interrupt or DMA transfer will be executed during the interval.

4: Before exiting the CPU rewrite mode after completing erase or program operation, always be sure to execute a read array command or reset the flash memory.

Figure 5.3.2. CPU rewrite mode set/reset flowchart

5.3.2 Precautions on CPU Rewrite Mode

Described below are the precautions to be observed when rewriting the flash memory in CPU rewrite mode.

(1) Operation speed

During CPU rewrite mode, set the main clock frequency as shown below using the main clock divide ratio select bit (bit 6 at address 0006_{16} and bits 6 and 7 at address 0007_{16}):

5.0 MHz or less when wait bit (bit 7 at address 0005_{16}) = 0 (without internal access wait state)

10.0 MHz or less when wait bit (bit 7 at address 0005_{16}) = 1 (with internal access wait state)

(2) Instructions inhibited against use

The instructions listed below cannot be used during CPU rewrite mode because they refer to the internal data of the flash memory:

UND instruction, INTO instruction, JMPS instruction, JSRS instruction, and BRK instruction

(3) Interrupts inhibited against use

The $\overline{\text{NMI}}$, address match, and watchdog timer interrupts cannot be used during CPU rewrite mode because they refer to the internal data of the flash memory. If interrupts have their vector in the variable vector table, they can be used by transferring the vector into the RAM area.

(4) Reset

If the control circuit is reset while erasing is in progress, a 5 ms wait is needed so that the flash memory can restore normal operation. Set a 5 ms wait to release the reset operation.

Also, when the reset has been released, the program execute start address is automatically set to $0DE000_{16}$ at boot mode, therefore program so that the execute start address of the boot ROM is $0DE000_{16}$.

(5) Writing in the user ROM area

If power is lost while rewriting blocks that contain the flash rewrite program with the CPU rewrite mode, those blocks may not be correctly rewritten and it is possible that the flash memory can no longer be rewritten after that. Therefore, it is recommended to use the standard serial I/O mode or parallel I/O mode to rewrite these blocks.

5.3.3 Software Commands

Table 5.3.1 lists the software commands available with the M306H2 (flash memory version).

After setting the CPU rewrite mode select bit to 1, write a software command to specify an erase or program operation. Note that when entering a software command, the upper byte (D_8 to D_{15}) is ignored.

The content of each software command is explained below.

Table 5.3.1. List of software commands (CPU rewrite mode)

Command	Cycle number	First bus cycle			Second bus cycle		
		Mode	Address	Data (D_0 to D_7)	Mode	Address	Data (D_0 to D_7)
Read array	1	Write	X (Note 5)	FF_{16}			
Read status register	2	Write	X	70_{16}	Read	X	SRD (Note 2)
Clear status register	1	Write	X	50_{16}			
Program (Note 3)	2	Write	X	40_{16}	Write	WA (Note 3)	WD (Note 3)
Erase all block	2	Write	X	20_{16}	Write	X	20_{16}
Block erase	2	Write	X	20_{16}	Write	BA (Note 4)	$D0_{16}$

Note 1: When a software command is input, the high-order byte of data (D_8 to D_{15}) is ignored.
Note 2: SRD = Status Register Data
Note 3: WA = Write Address, WD = Write Data
Note 4: BA = Block Address (Enter the optional address of each block that is an even address.)
Note 5: X denotes a given address in the user ROM area (that is an even address).

Read Array Command (FF_{16})

The read array mode is entered by writing the command code "FF_{16}" in the first bus cycle. When an even address to be read is input in one of the bus cycles that follow, the content of the specified address is read out at the data bus (D_0–D_{15}), 16 bits at a time.

The read array mode is retained intact until another command is written.

Read Status Register Command (70_{16})

When the command code "70_{16}" is written in the first bus cycle, the content of the status register is read out at the data bus (D_0–D_7) by a read in the second bus cycle.

The status register is explained in the next section.

Clear Status Register Command (50_{16})

This command is used to clear the bits SR4 to SR5 of the status register after they have been set. These bits indicate that operation has ended in an error. To use this command, write the command code "50_{16}" in the first bus cycle.

Program Command (40$_{16}$)

Program operation starts when the command code "40$_{16}$" is written in the first bus cycle. Then, if the address and data to program are written in the 2nd bus cycle, program operation (data programming and verification) will start.

Whether the write operation is completed can be confirmed by reading the status register or the RY/$\overline{BY}$ status flag. When the program starts, the read status register mode is accessed automatically and the content of the status register is read into the data bus (D0 - D7). The status register bit 7 (SR7) is set to 0 at the same time the write operation starts and is returned to 1 upon completion of the write operation. In this case, the read status register mode remains active until the Read Array command (FF$_{16}$) is written.

The RY/$\overline{BY}$ status flag is 0 during write operation and 1 when the write operation is completed as is the status register bit 7.

At program end, program results can be checked by reading the status register.

Erase All Blocks Command (20$_{16}$/20$_{16}$)

By writing the command code "20$_{16}$" in the first bus cycle and the confirmation command code "20$_{16}$" in the second bus cycle that follows, the system starts erase all blocks(erase and erase verify).

Whether the erase all blocks command is terminated can be confirmed by reading the status register or the RY/$\overline{BY}$ status flag. When the erase all blocks operation starts, the read status register mode is accessed automatically and the content of the status register can be read out. The status register bit 7 (SR7) is set to 0 at the same time the erase operation starts and is returned to 1 upon completion of the erase operation. In this case, the read status register mode remains active until the Read Array command (FF$_{16}$) is written.

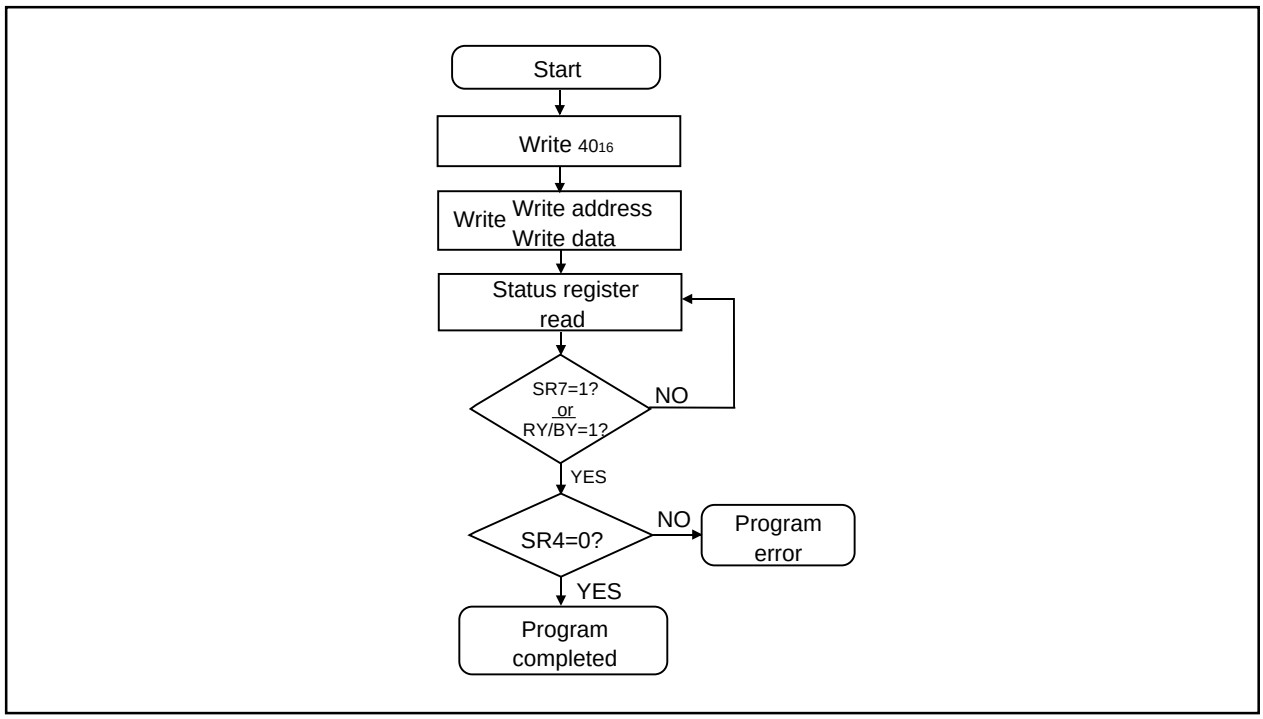


Figure 5.3.3. Program flowchart

The RY/$\overline{BY}$ status flag is 0 during erase operation and 1 when the erase operation is completed as is the status register bit 7.

At erase all blocks end, erase results can be checked by reading the status register. For details, refer to the section where the status register is detailed.

Block Erase Command (20_{16}/$D0_{16}$)

By writing the command code "20_{16}" in the first bus cycle and the confirmation command code "$D0_{16}$" in the second bus cycle that follows to the block address of a flash memory block, the system initiates a block erase (erase and erase verify) operation.

Whether the block erase operation is completed can be confirmed by reading the status register or the RY/$\overline{BY}$ status flag. At the same time the block erase operation starts, the read status register mode is automatically entered, so the content of the status register can be read out. The status register bit 7 (SR7) is set to 0 at the same time the block erase operation starts and is returned to 1 upon completion of the block erase operation. In this case, the read status register mode remains active until the Read Array command (FF_{16}).

The RY/$\overline{BY}$ status flag is 0 during block erase operation and 1 when the block erase operation is completed as is the status register bit 7.

After the block erase operation is completed, the status register can be read out to know the result of the block erase operation. For details, refer to the section where the status register is detailed.

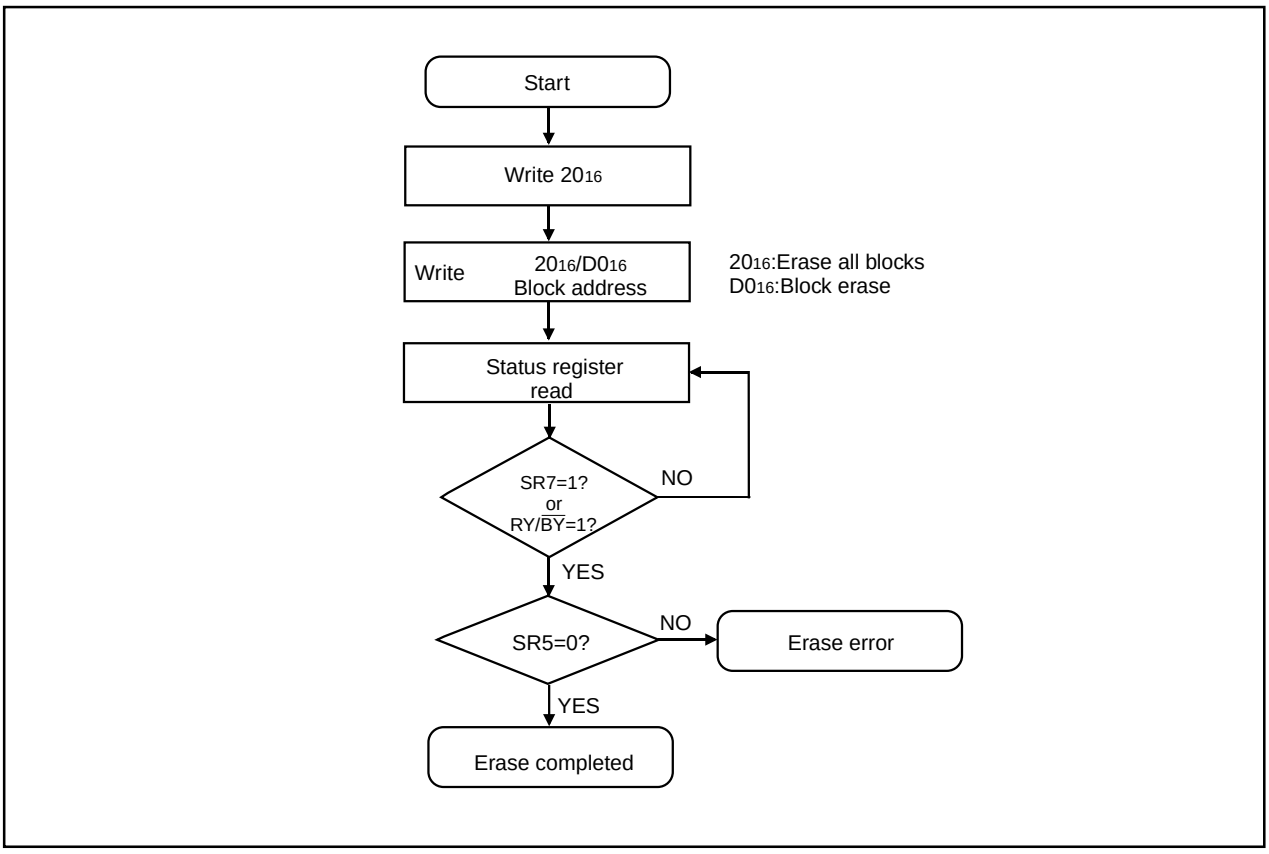

Figure 5.3.4. Erase flowchart

5.3.4 Status Register

The status register shows the operating state of the flash memory and whether erase operations and programs ended successfully or in error. It can be read in the following ways.

(1) By reading an arbitrary address from the user ROM area after writing the read status register command (70_{16})

(2) By reading an arbitrary address from the user ROM area in the period from when the program starts or erase operation starts to when the read array command (FF_{16}) is input

Table 5.3.2 shows the status register.

Also, the status register can be cleared in the following way.

(1) By writing the clear status register command (50_{16})
After a reset, the status register is set to "80_{16}".

Each bit in this register is explained below.

Sequencer status (SR7)

After power-on, the sequencer status is set to 1(ready).

The sequencer status indicates the operating status of the device. This status bit is set to 0 (busy) during write or erase operation and is set to 1 upon completion of these operations.

Erase status (SR5)

The erase status informs the operating status of erase operation to the CPU. When an erase error occurs, it is set to 1.

The erase status is reset to 0 when cleared.

Program status (SR4)

The program status informs the operating status of write operation to the CPU. When a write error occurs, it is set to 1.

The program status is reset to 0 when cleared.

If "1" is written for any of the SR5 or SR4 bits, the program, erase all blocks, and block erase commands are not accepted. Before executing these commands, execute the clear status register command (50_{16}) and clear the status register.

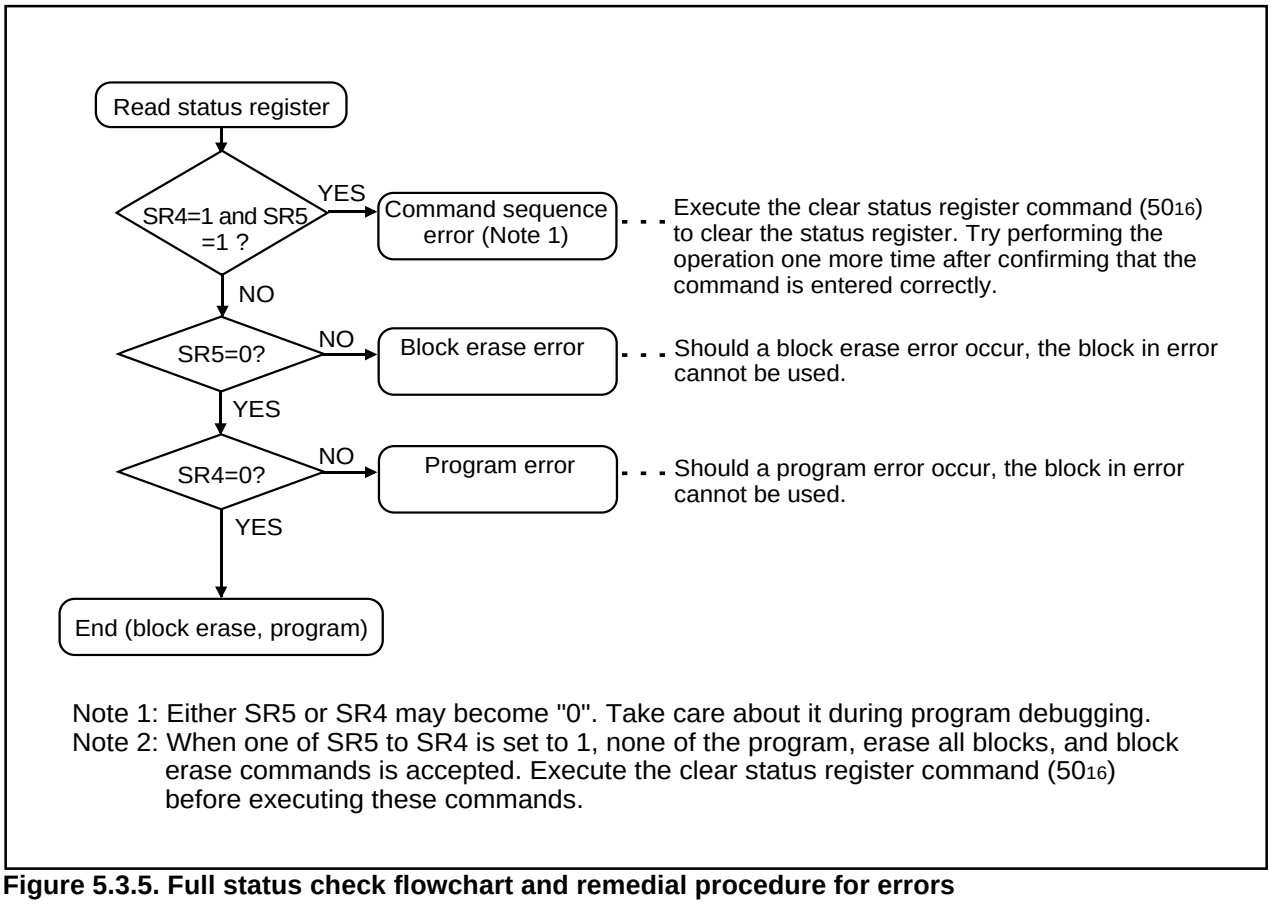
Also, any commands are not correct, both SR5 and SR4 are set to 1.

Table 5.3.2. Definition of each bit in status register

Each bit of SRD	Status name	Definition	
		"1"	"0"
SR7 (bit7)	Sequencer status	Ready	Busy
SR6 (bit6)	Reserved	-	-
SR5 (bit5)	Erase status	Terminated in error	Terminated normally
SR4 (bit4)	Program status	Terminated in error	Terminated normally
SR3 (bit3)	Reserved	-	-
SR2 (bit2)	Reserved	-	-
SR1 (bit1)	Reserved	-	-
SR0 (bit0)	Reserved	-	-

5.3.5 Full Status Check

By performing full status check, it is possible to know the execution results of erase and program operations. Figure 5.3.5 shows a full status check flowchart and the action to be taken when each error occurs.



Note 1: Either SR5 or SR4 may become "0". Take care about it during program debugging.
Note 2: When one of SR5 to SR4 is set to 1, none of the program, erase all blocks, and block erase commands is accepted. Execute the clear status register command (5016) before executing these commands.

Figure 5.3.5. Full status check flowchart and remedial procedure for errors

5.4 Functions To Inhibit Rewriting Flash Memory Version

To prevent the contents of the flash memory version from being read out or rewritten easily, the device incorporates a ROM code protect function for use in parallel I/O mode and an ID code check function for use in standard serial I/O mode.

5.4.1 ROM code protect function

The ROM code protect function is used to prohibit reading out or modifying the contents of the flash memory during parallel I/O mode and is set by using the ROM code protect control address register (0FFFFF16). Figure 5.4.1 shows the ROM code protect control address (0FFFFF16). (This address exists in the user ROM area.)

If one of the pair of ROM code protect bits is set to 0, ROM code protect is turned on, so that the contents of the flash memory version are protected against readout and modification. ROM code protect is implemented in two levels. If level 2 is selected, the flash memory is protected even against readout by a shipment inspection LSI tester, etc. When an attempt is made to select both level 1 and level 2, level 2 is selected by default.

If both of the two ROM code protect reset bits are set to “00,” ROM code protect is turned off, so that the contents of the flash memory version can be read out or modified. Once ROM code protect is turned on, the contents of the ROM code protect reset bits cannot be modified in parallel I/O mode. Use the serial I/O or some other mode to rewrite the contents of the ROM code protect reset bits.

ROM code protect control address

b7	b6	b5	b4	b3	b2	b1	b0
						1	1

Symbol: ROMCP
Address: 0FFFFF16
When reset: FF16

Bit symbol	Bit name	Function
Reserved bit		Always set this bit to 1.
ROMCP2	ROM code protect level 2 set bit (Note 1, 2)	b3 b2 00: Protect enabled 01: Protect enabled 10: Protect enabled 11: Protect disabled
ROMCR	ROM code protect reset bit (Note 3)	b5 b4 00: Protect removed 01: Protect set bit effective 10: Protect set bit effective 11: Protect set bit effective
ROMCP1	ROM code protect level 1 set bit (Note 1)	b7 b6 00: Protect enabled 01: Protect enabled 10: Protect enabled 11: Protect disabled

Note 1: When ROM code protect is turned on, the on-chip flash memory is protected against readout or modification in parallel input/output mode.
Note 2: When ROM code protect level 2 is turned on, ROM code readout by a shipment inspection LSI tester, etc. also is inhibited.
Note 3: The ROM code protect reset bits can be used to turn off ROM code protect level 1 and ROM code protect level 2. However, since these bits cannot be changed in parallel input/output mode, they need to be rewritten in serial input/output or some other mode.

Figure 5.4.1. ROM code protect control address

5.4.2 ID Code Check Function

Use this function in standard serial I/O mode. When the contents of the flash memory are not blank, the ID code sent from the peripheral unit is compared with the ID code written in the flash memory to see if they match. If the ID codes do not match, the commands sent from the peripheral unit are not accepted. The ID code consists of 8-bit data, the areas of which, beginning with the first byte, are $0FFFDF_{16}$, $0FFFE3_{16}$, $0FFFEB_{16}$, $0FFFEF_{16}$, $0FFFF3_{16}$, $0FFFF7_{16}$, and $0FFFFB_{16}$. Write a program which has had the ID code preset at these addresses to the flash memory.

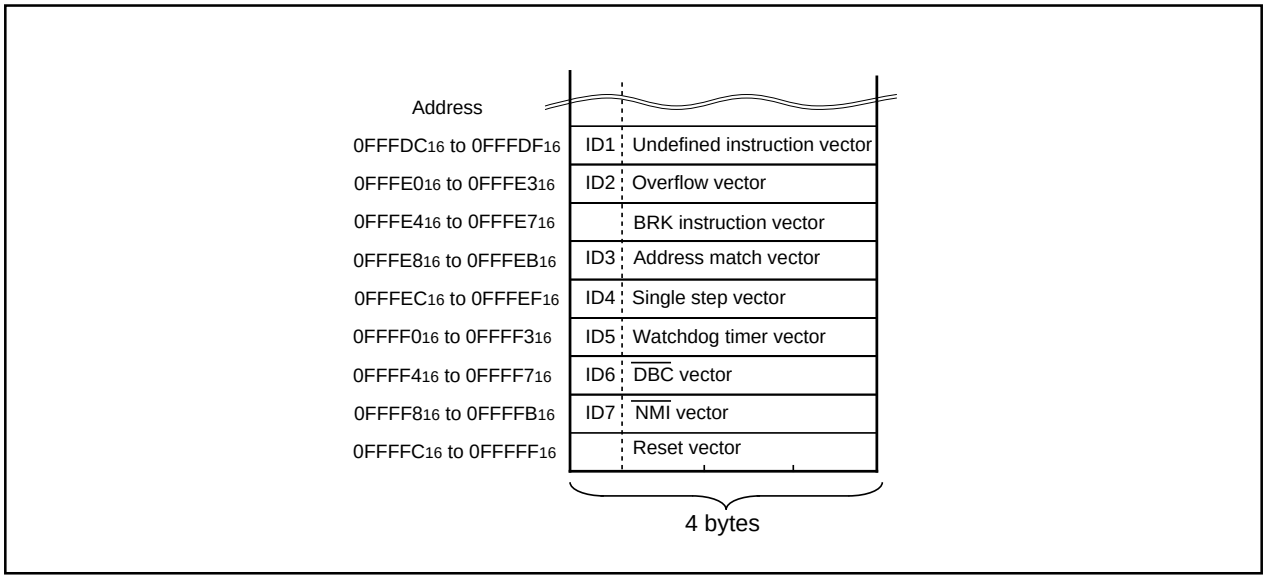


Figure 5.4.2. ID code store addresses

5.5 Parallel I/O Mode

The parallel I/O mode inputs and outputs the software commands, addresses and data needed to operate (read, program, erase, etc.) the internal flash memory. This I/O is parallel.

Use an exclusive programer supporting M306H2 (flash memory version).

Refer to the instruction manual of each programer maker for the details of use.

User ROM and Boot ROM Areas

In parallel I/O mode, the user ROM and boot ROM areas shown in Figure 5.2.1 can be rewritten. Both areas of flash memory can be operated on in the same way.

Program and block erase operations can be performed in the user ROM area. The user ROM area and its blocks are shown in Figure 5.2.1.

The boot ROM area is 8 Kbytes in size. In parallel I/O mode, it is located at addresses $0DE000_{16}$ through $0DFFFF_{16}$. Make sure program and block erase operations are always performed within this address range. (Access to any location outside this address range is prohibited.)

In the boot ROM area, an erase block operation is applied to only one 8 Kbyte block. The boot ROM area has had a standard serial I/O mode control program stored in it when shipped from the Mitsubishi factory. Therefore, using the device in standard serial input/output mode, you do not need to write to the boot ROM area.

5.6 Standard serial I/O mode

The standard serial I/O mode inputs and outputs the software commands, addresses and data needed to operate (read, program, erase, etc.) the internal flash memory. This I/O is serial. There are actually two standard serial I/O modes: mode 1, which is clock synchronized, and mode 2, which is asynchronized. Both modes require a purpose-specific peripheral unit.

The standard serial I/O mode is different from the parallel I/O mode in that the CPU controls flash memory rewrite (uses the CPU's rewrite mode), rewrite data input and so forth. The standard serial I/O mode is started by connecting “H” to the CNVSS pin and P50 pin, connecting “L” to the M1 pin, and releasing the reset operation. (In the ordinary command mode, set CNVss pin to “L” level.)
This control program is written in the boot ROM area when the product is shipped from Mitsubishi. Accordingly, make note of the fact that the standard serial I/O mode cannot be used if the boot ROM area is rewritten in the parallel I/O mode. Figure 5.6.1 shows the pin connections for the standard serial I/O mode. Serial data I/O uses UART1 and transfers the data serially in 8-bit units. Standard serial I/O switches between mode 1 (clock synchronized) and mode 2 (clock asynchronized) according to the level of CLK1 pin when the reset is released.

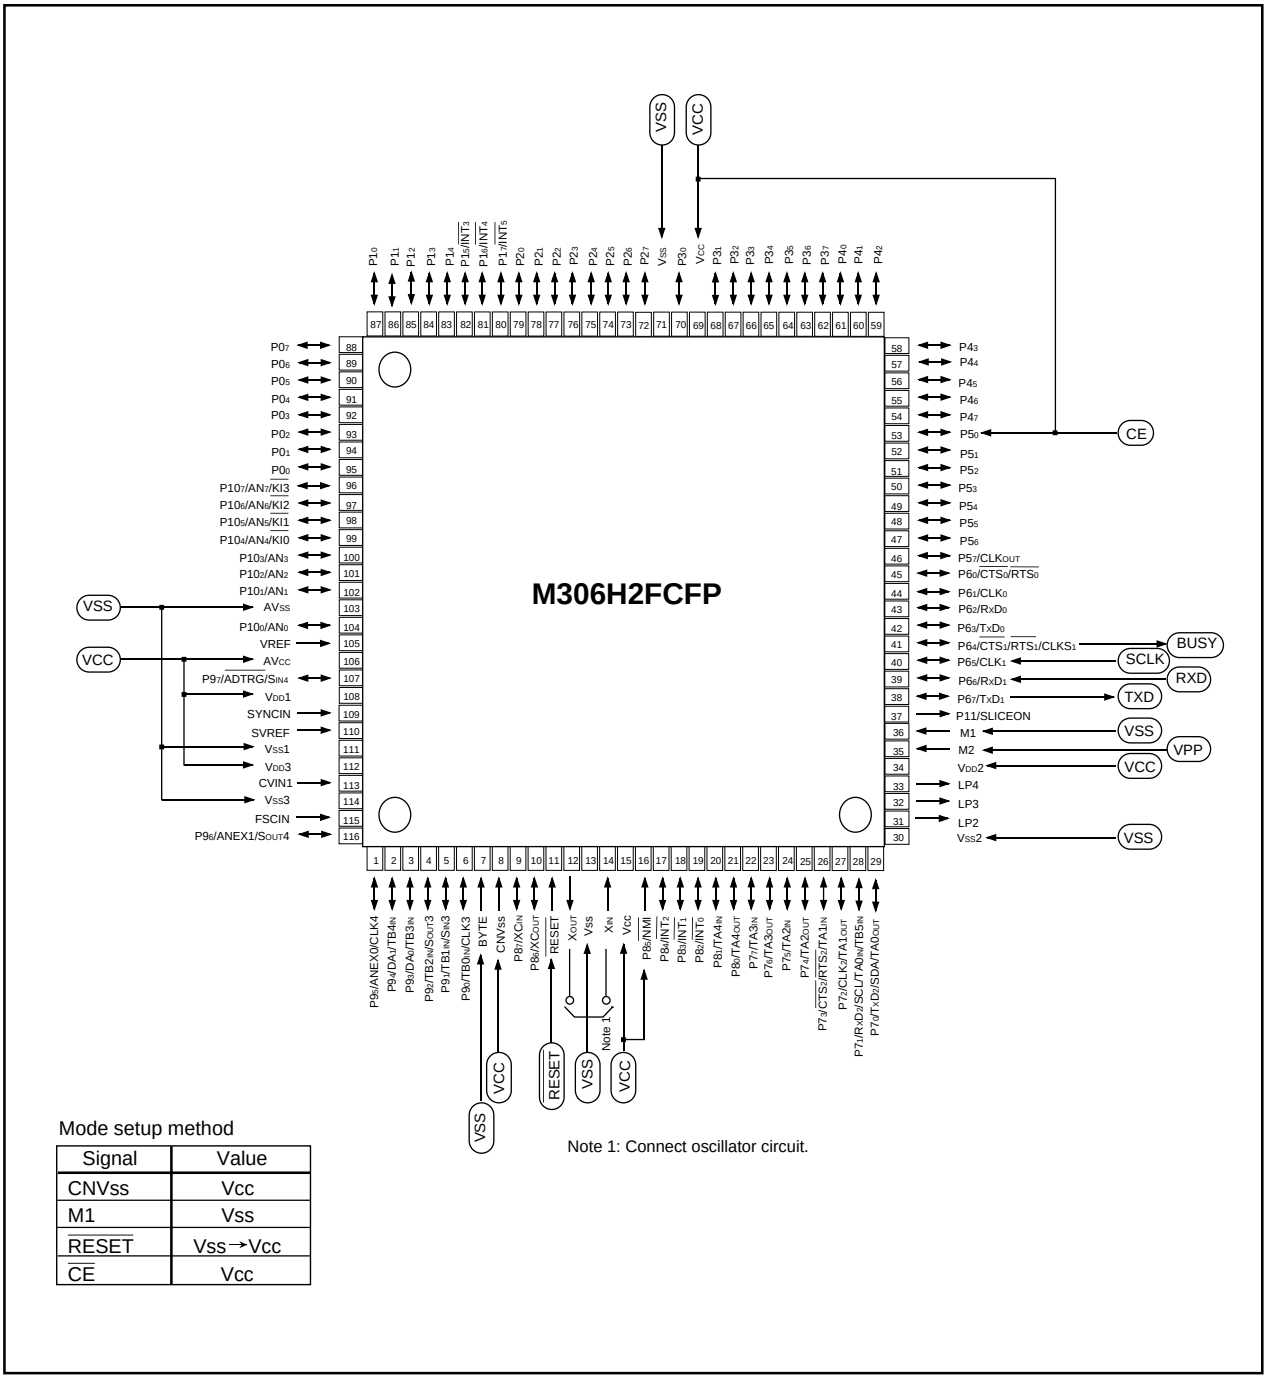
To use standard serial I/O mode 1 (clock synchronized), set the CLK1 pin to “H” level and release the reset. The operation uses the four UART1 pins CLK1, RxD1, TxD1 and RTS1 (BUSY). The CLK1 pin is the transfer clock input pin through which an external transfer clock is input. The TxD1 pin is for CMOS output. The RTS1 (BUSY) pin outputs an "L" level when ready for reception and an “L” level when reception starts.

To use standard serial I/O mode 2 (clock asynchronized), set the CLK1 pin to “L” level and release the reset. The operation uses the two UART1 pins RxD1 and TxD1.

In the standard serial I/O mode, only the user ROM area indicated in Figure 5.2.1 can be rewritten. The boot ROM cannot.
In the standard serial I/O mode, a 7-byte ID code is used. When there is data in the flash memory, commands sent from the peripheral unit (programmer) are not accepted unless the ID code matches.

Pin functions (Flash memory standard serial I/O mode) (Note 1)

Pin	Name	I/O	Description
VCC,VSS	Power input		Apply a 4.75 - 5.25 V voltage on the Vcc pin, and 0 V voltage on the Vss pin.
CNVSS	CNVSS	I	Connect to VCC.
$\overline{\text{RESET}}$	Reset input	I	Reset input pin. While reset is "L" level, a 20 cycle or longer clock must be input to X_{IN} pin.
M1	M1 input	I	Connect to VSS.
M2	M2 input	I	Apply a 4.75 - 5.25 V voltage on the Vcc pin when built-in flash memory rewriting.
BYTE	$\overline{\text{BYTE}}$ input	I	Connect to VSS.
XIN	Clock input	I	Connect a ceramic resonator or crystal oscillator between XIN and XOUT pins. To input an externally generated clock, input it to X IN pin and open XOUT pin.
XOUT	Clock output	O	
AVCC, AVSS	Analog power supply input		Connect AVSS to VSS and AVCC to VCC, respectively.
VREF	Reference voltage input		Enter the reference voltage for AD from this pin.
P00 to P07	Input port P0	I	Input "H" or "L" level signal or open.
P10 to P17	Input port P1	I	Input "H" or "L" level signal or open.
P20 to P27	Input port P2	I	Input "H" or "L" level signal or open.
P30 to P37	Input port P3	I	Input "H" or "L" level signal or open.
P40 to P47	Input port P4	I	Input "H" or "L" level signal or open.
P50	$\overline{\text{CE}}$ input	I	Input "H" level signal or open.
P51 to P57	Input port P5	I	Input "H" or "L" level signal or open.
P60 to P63	Input port P6	I	Input "H" or "L" level signal or open.
P64	BUSY output	O	BUSY signal output pin
P65	SCLK input	I	Serial clock input pin
P66	RXD input	I	Serial data input pin
P67	TXD output	O	Serial data output pin
P70 to P77	Input port P7	I	Input "H" or "L" level signal or open.
P80 to P84,P86,P87	Input port P8	I	Input "H" or "L" level signal or open.
P85	$\overline{\text{NMI}}$ input	I	Connect this pin to Vcc.
P90 to P97	Input port P9	I	Input "H" or "L" level signal or open.
P100 to P107	Input port P10	I	Input "H" or "L" level signal or open.
P11	Input port P11	O	Open
VDD1, VSS1	Power input		Connect VDD1 pin to VCC and connect VSS1 pin to VSS.
VDD2, VSS2	Power input		Connect VDD2 pin to VCC and connect VSS2 pin to VSS.
VDD3, VSS3	Power input		Connect VDD3 pin to VCC and connect VSS3 pin to VSS.
LP2 to LP4	Filter output	O	Open
FSCIN	fsc input pin for synchronized signal generating	I	Subcarrier (fsc) input pin for synchronized signal generating. Input "L" level signal or open.
CVIN1, SYNCIN	Composite video signal input	I	Input pin of external compound video signal. Input "H" or "L" level signal or open.
SVREF	Synchronous slice level input	I	Slice voltage input pin at the time of slicing synchronized signal.



Mode setup method

Signal	Value
CNVss	Vcc
M1	Vss
$\overline{\text{RESET}}$	Vss→Vcc
$\overline{\text{CE}}$	Vcc

Figure 5.6.1. Pin connections for serial I/O mode (1)

5.6.1 Overview of standard serial I/O mode 1 (clock synchronized)

In standard serial I/O mode 1, software commands, addresses and data are input and output between the MCU and peripheral units (serial programer, etc.) using 4-wire clock-synchronized serial I/O (UART1). Standard serial I/O mode 1 is engaged by releasing the reset with the $P6_5$ (CLK_1) pin "H" level.

In reception, software commands, addresses and program data are synchronized with the rise of the transfer clock that is input to the CLK_1 pin, and are then input to the MCU via the RxD_1 pin. In transmission, the read data and status are synchronized with the fall of the transfer clock, and output from the TxD_1 pin.

The TxD_1 pin is for CMOS output. Transfer is in 8-bit units with LSB first.

When busy, such as during transmission, reception, erasing or program execution, the RTS_1 (BUSY) pin is "H" level. Accordingly, always start the next transfer after the RTS_1 (BUSY) pin is "L" level.

Also, data and status registers in memory can be read after inputting software commands. Status, such as the operating state of the flash memory or whether a program or erase operation ended successfully or not, can be checked by reading the status register. Here following are explained software commands, status registers, etc.

5.6.2 Software Commands

Table 5.6.1 lists software commands. In the standard serial I/O mode 1, erase operations, programs and reading are controlled by transferring software commands via the RxD1 pin. Software commands are explained here below.

Table 5.6.1. Software commands (Standard serial I/O mode 1)

	Control command	1st byte transfer	2nd byte	3rd byte	4th byte	5th byte	6th byte		When ID is not verified
1	Page read	FF_{16}	Address (middle)	Address (high)	Data output	Data output	Data output	Data output to 259th byte	Not acceptable
2	Page program	41_{16}	Address (middle)	Address (high)	Data input	Data input	Data input	Data input to 259th byte	Not acceptable
3	Block erase	20_{16}	Address (middle)	Address (high)	$D0_{16}$				Not acceptable
4	Erase all blocks	$A7_{16}$	$D0_{16}$						Not acceptable
5	Read status register	70_{16}	SRD output	SRD1 output					Acceptable
6	Clear status register	50_{16}							Not acceptable
7	ID check function	$F5_{16}$	Address (low)	Address (middle)	Address (high)	ID size	ID1	To ID7	Acceptable
8	Download function	FA_{16}	Size (low)	Size (high)	Check-sum	Data input	To required number of times		Not acceptable
9	Version data output function	FB_{16}	Version data output	Version data output	Version data output	Version data output	Version data output	Version data output to 9th byte	Acceptable
10	Boot ROM area output function	FC_{16}	Address (middle)	Address (high)	Data output	Data output	Data output	Data output to 259th byte	Not acceptable
11	Read check data	FD_{16}	Check data (low)	Check data (high)					Not acceptable

Note 1: Shading indicates transfer from flash memory microcomputer to peripheral unit. All other data is transferred from the peripheral unit to the flash memory microcomputer.

Note 2: SRD refers to status register data. SRD1 refers to status register 1 data.

Note 3: All commands can be accepted when the flash memory is totally blank.

Page Read Command

This command reads the specified page (256 bytes) in the flash memory sequentially one byte at a time. Execute the page read command as explained here following.

(1) Transfer the "FF_{16}" command code with the 1st byte.

(2) Transfer addresses A_8 to A_{15} and A_{16} to A_{23} with the 2nd and 3rd bytes respectively.

(3) From the 4th byte onward, data (D_0–D_7) for the page (256 bytes) specified with addresses A_8 to A_{23} will be output sequentially from the smallest address first in sync with the fall of the clock.

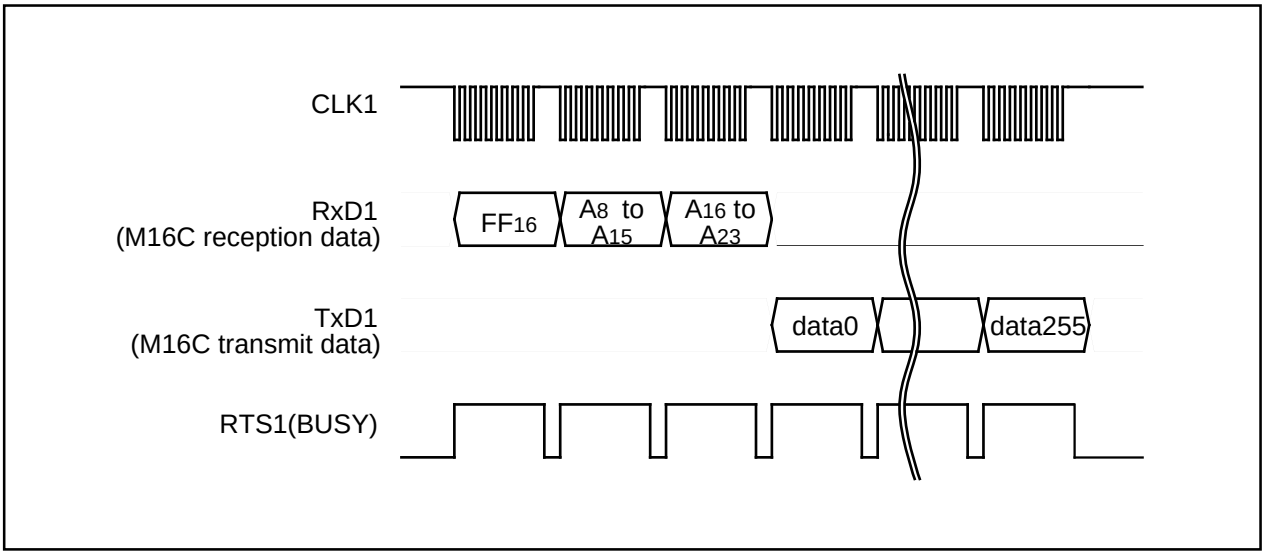


Figure 5.6.2. Timing for page read

Read Status Register Command

This command reads status information. When the "70_{16}" command code is sent with the 1st byte, the contents of the status register (SRD) specified with the 2nd byte and the contents of status register 1 (SRD1) specified with the 3rd byte are read.

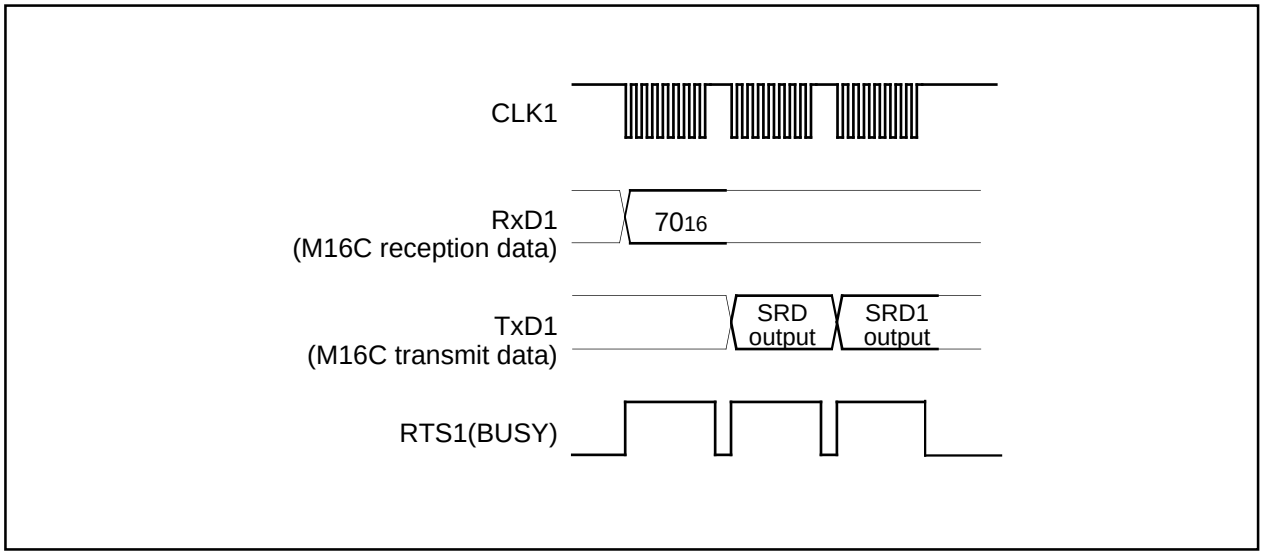

Figure 5.6.3. Timing for reading the status register

Clear Status Register Command

This command clears the bits (SR4–SR5) which are set when the status register operation ends in error. When the "50_{16}" command code is sent with the 1st byte, the aforementioned bits are cleared. When the clear status register operation ends, the RTS_1 (BUSY) signal changes from the "H" to the "L" level.

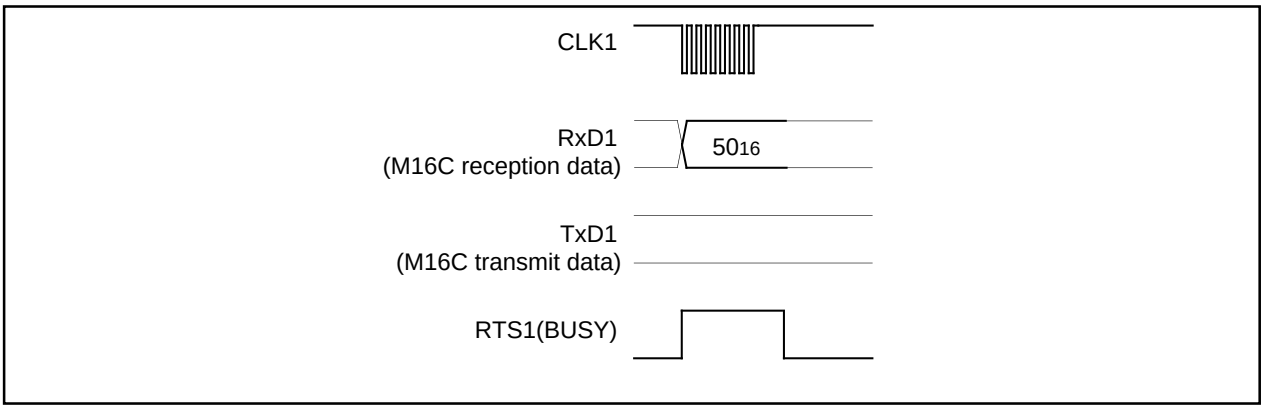

Figure 5.6.4. Timing for clearing the status register

Page Program Command

This command writes the specified page (256 bytes) in the flash memory sequentially one byte at a time. Execute the page program command as explained here following.

(1) Transfer the "41_{16}" command code with the 1st byte.
(2) Transfer addresses A_8 to A_{15} and A_{16} to A_{23} with the 2nd and 3rd bytes respectively.
(3) From the 4th byte onward, as write data (D_0–D_7) for the page (256 bytes) specified with addresses A_8 to A_{23} is input sequentially from the smallest address first, that page is auto matically written.

When reception setup for the next 256 bytes ends, the RTS_1 (BUSY) signal changes from the "H" to the "L" level. The result of the page program can be known by reading the status register. For more information, see the section on the status register.

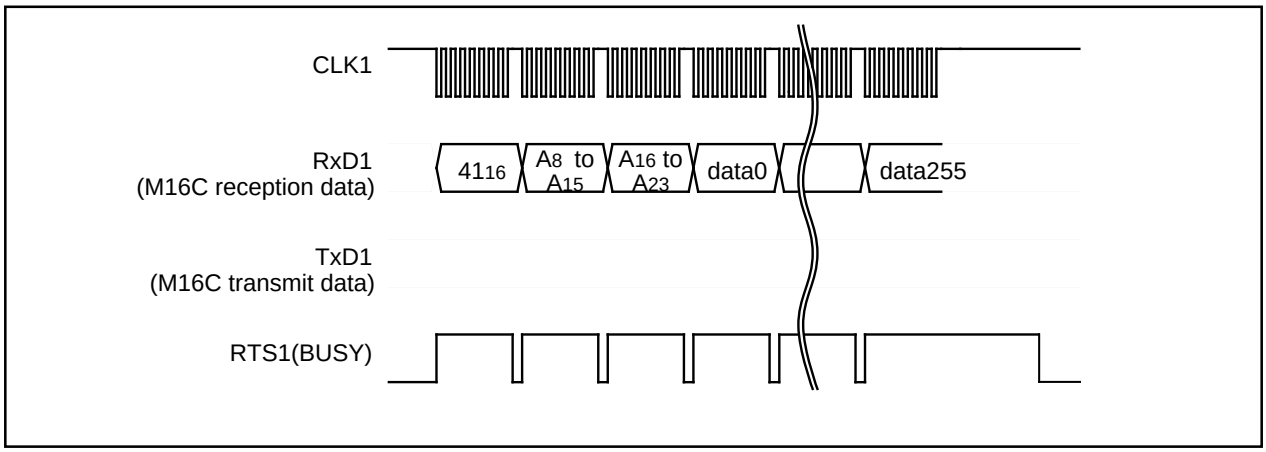

Figure 5.6.5. Timing for the page program

Block Erase Command

This command erases the data in the specified block. Execute the block erase command as explained here following.

(1) Transfer the "20_{16}" command code with the 1st byte.
(2) Transfer addresses A_8 to A_{15} and A_{16} to A_{23} with the 2nd and 3rd bytes respectively.
(3) Transfer the verify command code "$D0_{16}$" with the 4th byte. With the verify command code, the erase operation will start for the specified block in the flash memory. Write the optional even address of the specified block for addresses A_8 to A_{23}.

When block erasing ends, the RTS_1 (BUSY) signal changes from the "H" to the "L" level. After block erase ends, the result of the block erase operation can be known by reading the status register. For more information, see the section on the status register.

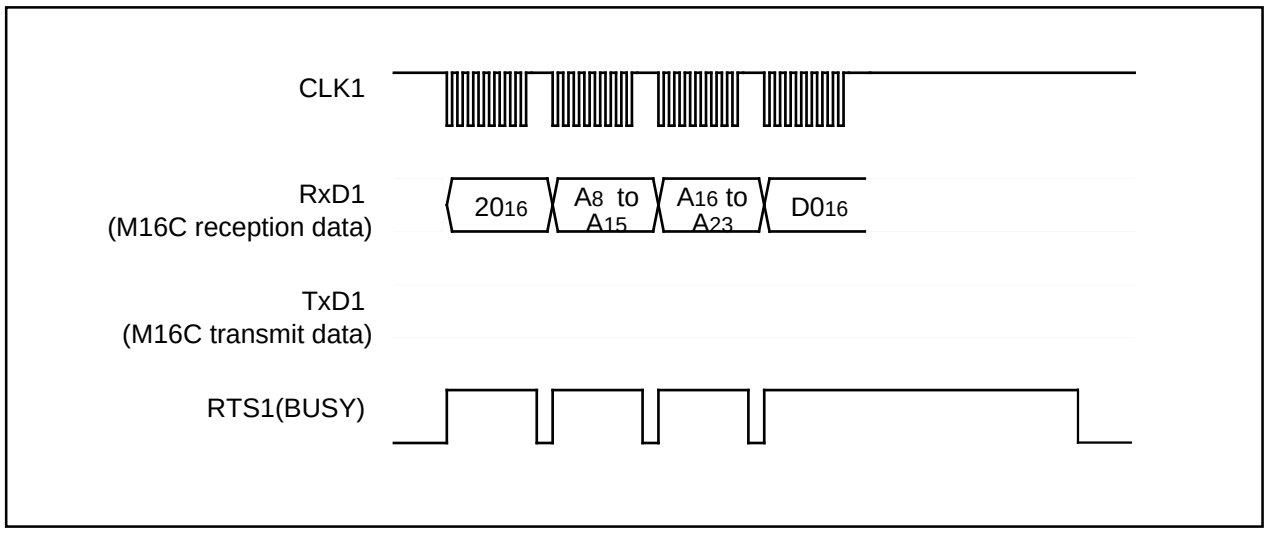

Figure 5.6.6. Timing for block erasing

Erase All Blocks Command

This command erases the content of all blocks. Execute the erase all blocks command as explained here following.

(1) Transfer the "A7$_{16}$" command code with the 1st byte.

(2) Transfer the verify command code "D0$_{16}$" with the 2nd byte. With the verify command code, the erase operation will start and continue for all blocks in the flash memory.
When block erasing ends, the RTS$_1$ (BUSY) signal changes from the "H" to the "L" level. The result of the erase operation can be known by reading the status register.

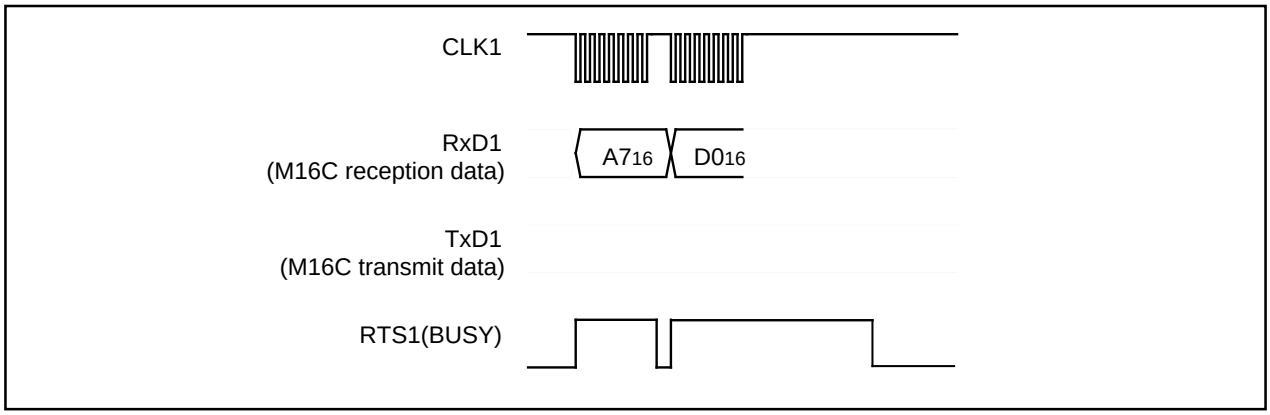

Figure 5.6.7. Timing for erasing all blocks

Download Command

This command downloads a program to the RAM for execution. Execute the download command as explained here following.

(1) Transfer the "FA$_{16}$" command code with the 1st byte.

(2) Transfer the program size with the 2nd and 3rd bytes.

(3) Transfer the check sum with the 4th byte. The check sum is added to all data sent with the 5th byte onward.

(4) The program to execute is sent with the 5th byte onward.

When all data has been transmitted, if the check sum matches, the downloaded program is executed. The size of the program will vary according to the internal RAM.

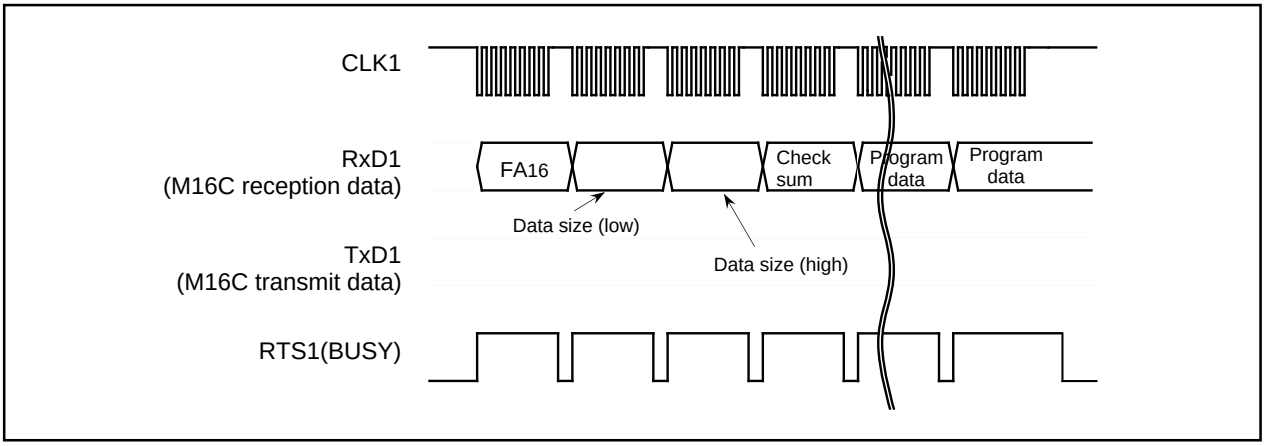

Figure 5.6.8. Timing for download

Version Information Output Command

This command outputs the version information of the control program stored in the boot area. Execute the version information output command as explained here following.

(1) Transfer the "FB16" command code with the 1st byte.

(2) The version information will be output from the 2nd byte onward. This data is composed of 8 ASCII code characters.

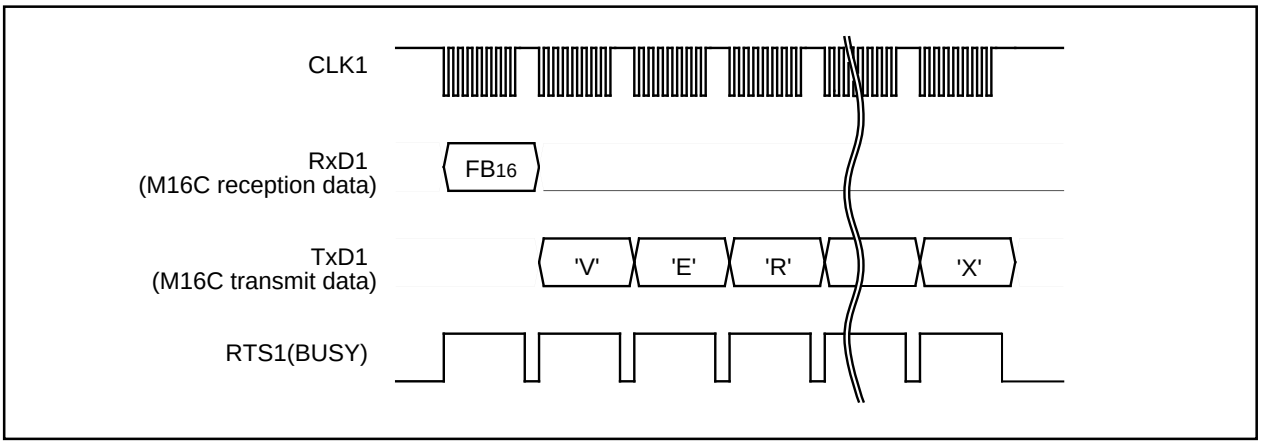

Figure 5.6.9. Timing for version information output

Boot ROM Area Output Command

This command outputs the control program stored in the boot ROM area in one page blocks (256 bytes). Execute the boot ROM area output command as explained here following.

(1) Transfer the "FC16" command code with the 1st byte.

(2) Transfer addresses A8 to A15 and A16 to A23 with the 2nd and 3rd bytes respectively.

(3) From the 4th byte onward, data (D0–D7) for the page (256 bytes) specified with addresses A8 to A23 will be output sequentially from the smallest address first, in sync with the fall of the clock.

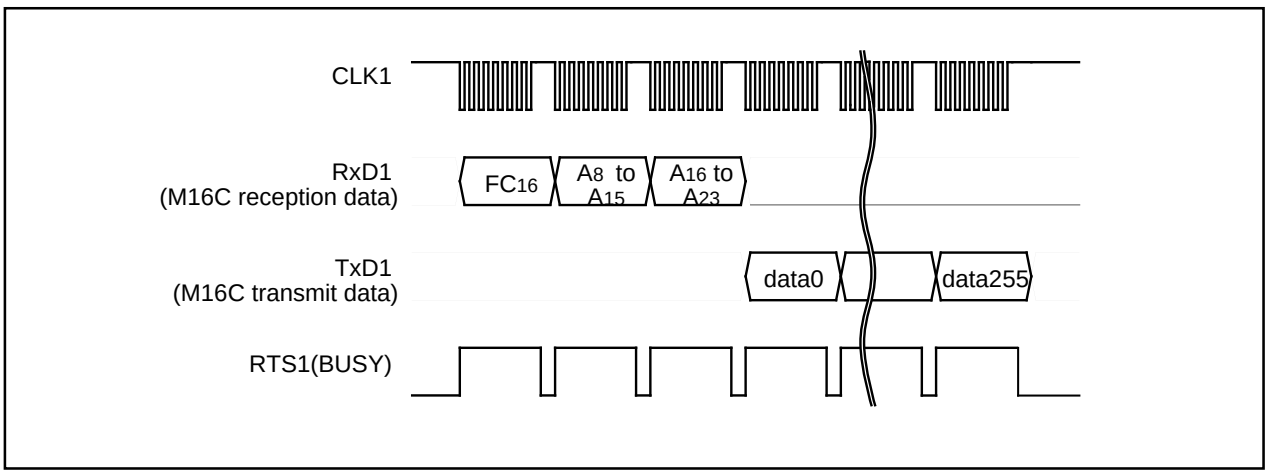

Figure 5.6.10. Timing for boot ROM area output

ID Check

This command checks the ID code. Execute the boot ID check command as explained here following.

(1) Transfer the "F5$_{16}$" command code with the 1st byte.

(2) Transfer addresses A$_0$ to A$_7$, A$_8$ to A$_{15}$ and A$_{16}$ to A$_{23}$ of the 1st byte of the ID code with the 2nd, 3rd and 4th bytes respectively.

(3) Transfer the number of data sets of the ID code with the 5th byte.

(4) The ID code is sent with the 6th byte onward, starting with the 1st byte of the code.

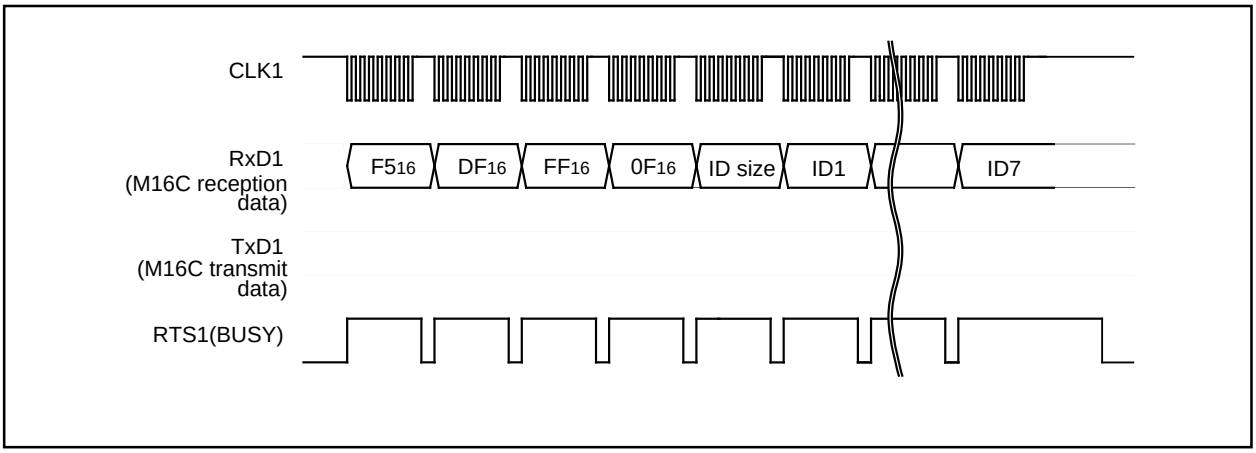

Figure 5.6.11. Timing for the ID check

ID Code

When the flash memory is not blank, the ID code sent from the peripheral units and the ID code written in the flash memory are compared to see if they match. If the codes do not match, the command sent from the peripheral units is not accepted. An ID code contains 8 bits of data. Area is, from the 1st byte, addresses 0FFFDF$_{16}$, 0FFFE3$_{16}$, 0FFFEB$_{16}$, 0FFFEF$_{16}$, 0FFFF3$_{16}$, 0FFFF7$_{16}$ and 0FFFFB$_{16}$. Write a program into the flash memory, which already has the ID code set for these addresses.

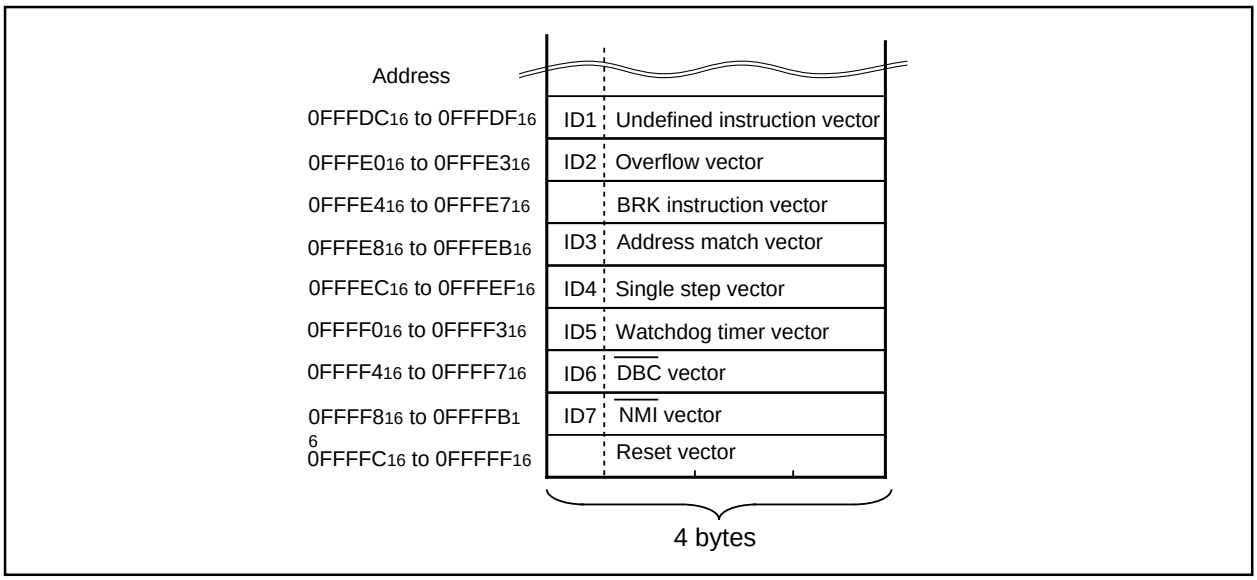

Figure 5.6.12. ID code storage addresses

Read Check Data

This command reads the check data that confirms that the write data, which was sent with the page program command, was successfully received.

(1) Transfer the "FD16" command code with the 1st byte.

(2) The check data (low) is received with the 2nd byte and the check data (high) with the 3rd.

To use this read check data command, first execute the command and then initialize the check data. Next, execute the page program command the required number of times. After that, when the read check command is executed again, the check data for all of the read data that was sent with the page program command during this time is read. Check data adds write data in 1 byte units and obtains the two's-compliment of the insignificant 2 bytes of the accumulated data.

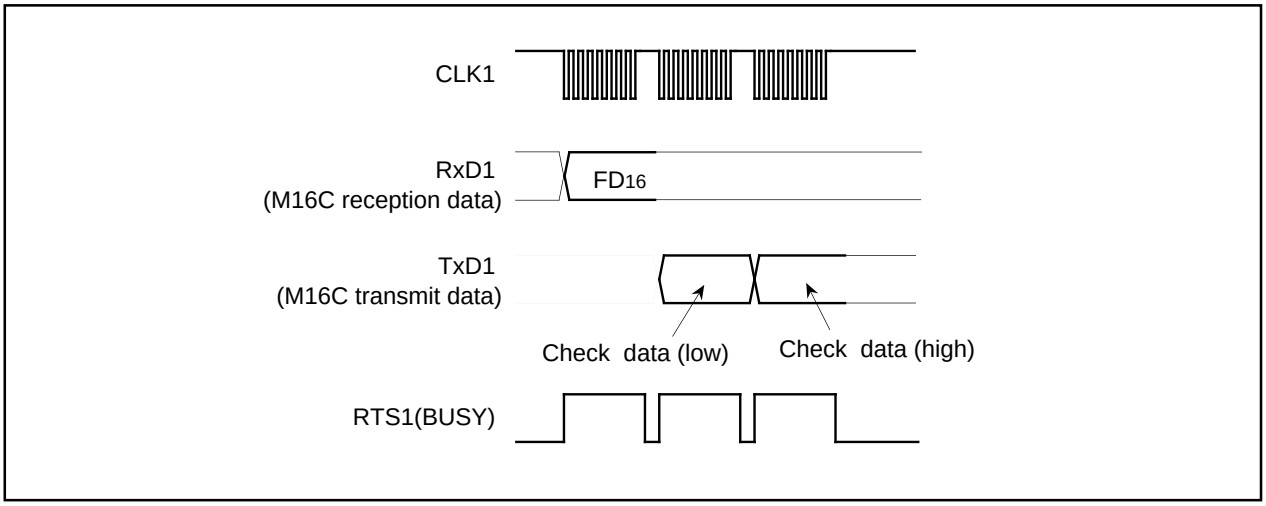

Figure 5.6.13. Timing for the read check data

Status Register (SRD)

The status register indicates operating status of the flash memory and status such as whether an erase operation or a program ended successfully or in error. It can be read by writing the read status register command (70_{16}). Also, the status register is cleared by writing the clear status register command (50_{16}).

Table 5.6.2 gives the definition of each status register bit. After clearing the reset, the status register outputs "80_{16}".

Table 5.6.2. Status register (SRD)

SRD0 bits	Status name	Definition	
		"1"	"0"
SR7 (bit7)	Sequencer status	Ready	Busy
SR6 (bit6)	Reserved	-	-
SR5 (bit5)	Erase status	Terminated in error	Terminated normally
SR4 (bit4)	Program status	Terminated in error	Terminated normally
SR3 (bit3)	Reserved	-	-
SR2 (bit2)	Reserved	-	-
SR1 (bit1)	Reserved	-	-
SR0 (bit0)	Reserved	-	-

Sequencer status (SR7)

After power-on, the sequencer status is set to 1(ready).

The sequencer status indicates the operating status of the device. This status bit is set to 0 (busy) during write or erase operation and is set to 1 upon completion of these operations.

Erase Status (SR5)

The erase status reports the operating status of the auto erase operation. If an erase error occurs, it is set to "1". When the erase status is cleared, it is set to "0".

Program Status (SR4)

The program status reports the operating status of the auto write operation. If a write error occurs, it is set to "1". When the program status is cleared, it is set to "0".

Status Register 1 (SRD1)

Status register 1 indicates the status of serial communications, results from ID checks and results from check sum comparisons. It can be read after the SRD by writing the read status register command (70_{16}). Also, status register 1 is cleared by writing the clear status register command (50_{16}). Table 5.6.3 gives the definition of each status register 1 bit. "00_{16}" is output when power is turned ON and the flag status is maintained even after the reset.

Table 5.6.3. Status register 1 (SRD1)

SRD1 bits	Status name	Definition	
		"1"	"0"
SR15 (bit7)	Boot update completed bit	Update completed	Not update
SR14 (bit6)	Reserved	-	-
SR13 (bit5)	Reserved	-	-
SR12 (bit4)	Check sum match bit	Match	Mismatch
SR11 (bit3) SR10 (bit2)	ID check completed bits	00 Not verified 01 Verification mismatch 10 Reserved 11 Verified	
SR9 (bit1)	Data receive time out	Time out	Normal operation
SR8 (bit0)	Reserved	-	-

Boot Update Completed Bit (SR15)

This flag indicates whether the control program was downloaded to the RAM or not, using the download function.

Check Sum Match Bit (SR12)

This flag indicates whether the check sum matches or not when a program, is downloaded for execution using the download function.

ID Check Completed Bits (SR11 and SR10)

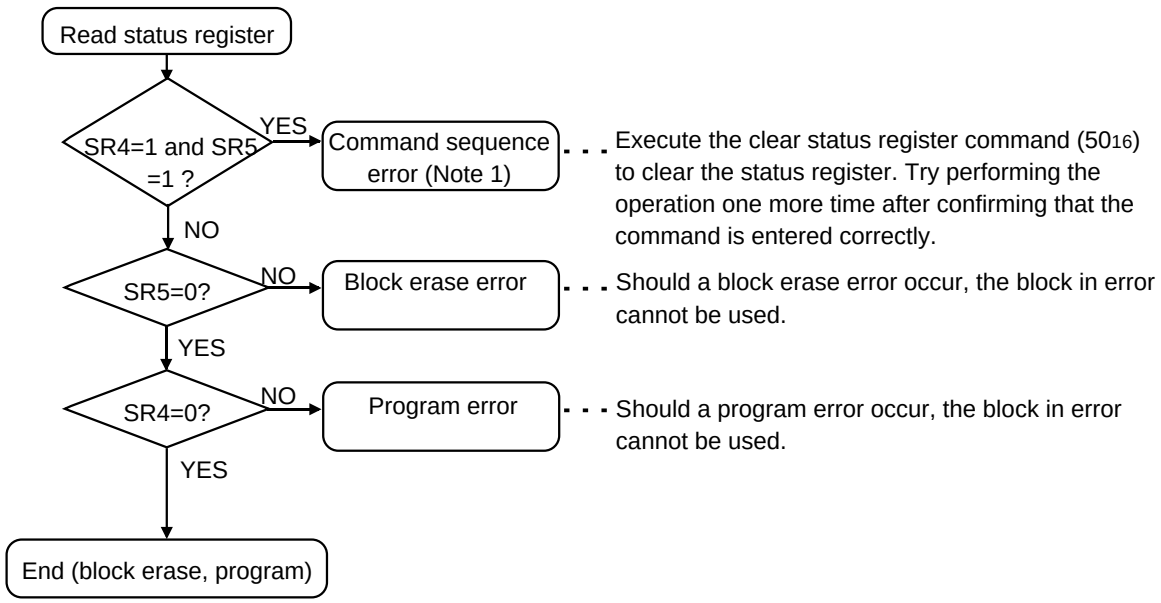
These flags indicate the result of ID checks. Some commands cannot be accepted without an ID check.

Data Receive Time Out (SR9)

This flag indicates when a time out error is generated during data reception. If this flag is attached during data reception, the received data is discarded and the microcomputer returns to the command wait state.

Full Status Check

Results from executed erase and program operations can be known by running a full status check. Figure 5.6.14 shows a flowchart of the full status check and explains how to remedy errors which occur.

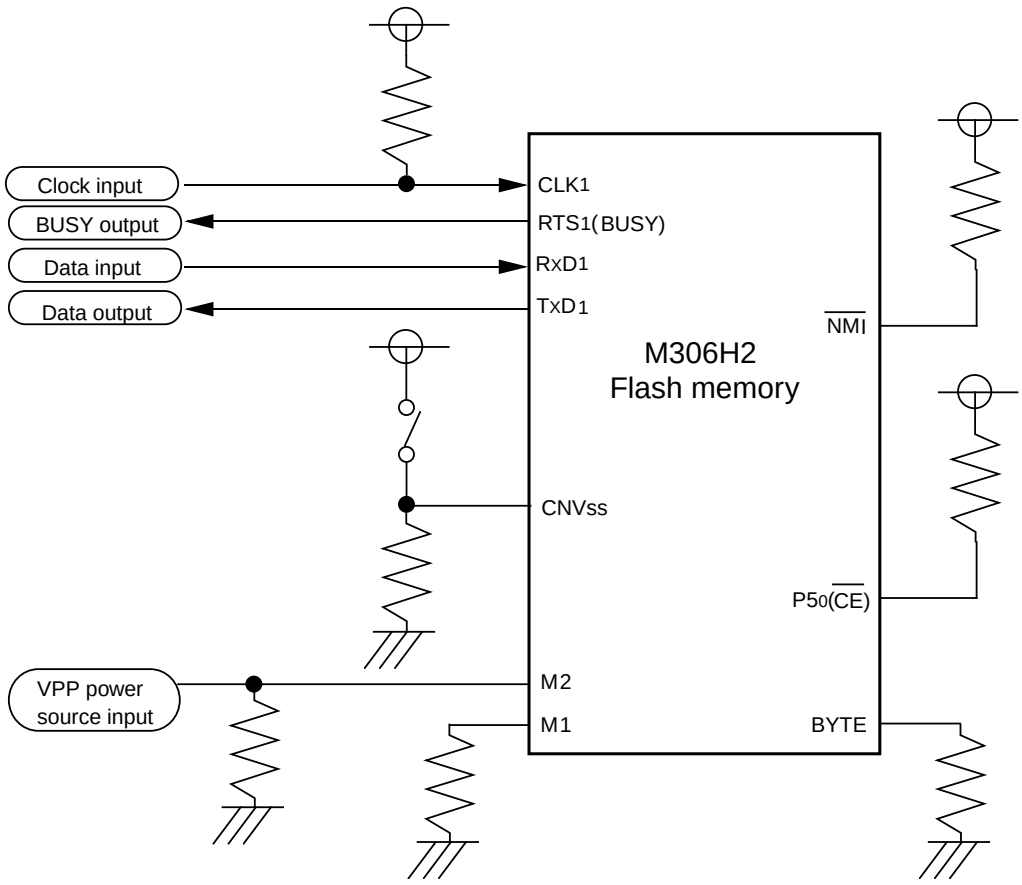


Note 1: Either SR5 or SR4 may become "0". Take care about it during program debugging.
Note 2: When one of SR5 to SR4 is set to 1, none of the program, erase all blocks, and block erase commands is accepted. Execute the clear status register command (5016) before executing these commands.

Figure 5.6.14. Full status check flowchart and remedial procedure for errors

Example Circuit Application for The Standard Serial I/O Mode 1

The below figure shows a circuit application for the standard serial I/O mode 1. Control pins will vary according to programmer, therefore see the peripheral unit manual for more information.



(1) Control pins and external circuitry will vary according to peripheral unit. For more information, see the peripheral unit manual.
(2) In this example, the Vpp power supply is supplied from an external source (writer). To use the user's power source, connect to 4.75V to 5.25 V.
(3) In this example, microcomputer mode and standard serial I/O mode are changed with a switch.

Figure 5.6.15. Example circuit application for the standard serial I/O mode 1

5.6.4 Overview of standard serial I/O mode 2 (clock asynchronized)

In standard serial I/O mode 2, software commands, addresses and data are input and output between the MCU and peripheral units (serial programer, etc.) using 2-wire clock-asynchronized serial I/O (UART1). Standard serial I/O mode 2 is engaged by releasing the reset with the $P6_5$ (CLK_1) pin "L" level.

The TxD_1 pin is for CMOS output. Data transfer is in 8-bit units with LSB first, 1 stop bit and parity OFF. After the reset is released, connections can be established at 9,600 bps when initial communications (Figure 5.6.16) are made with a peripheral unit. However, this requires a main clock with a minimum 2 MHz input oscillation frequency. Baud rate can also be changed from 9,600 bps to 19,200, 38,400 or 57,600 bps by executing software commands. However, communication errors may occur because of the oscillation frequency of the main clock. If errors occur, change the main clock's oscillation frequency and the baud rate.

After executing commands from a peripheral unit that requires time to erase and write data, as with erase and program commands, allow a sufficient time interval or execute the read status command and check how processing ended, before executing the next command.

Data and status registers in memory can be read after transmitting software commands. Status, such as the operating state of the flash memory or whether a program or erase operation ended successfully or not, can be checked by reading the status register. Here following are explained initial communications with peripheral units, how frequency is identified and software commands.

Initial communications with peripheral units

After the reset is released, the bit rate generator is adjusted to 9,600 bps to match the oscillation frequency of the main clock, by sending the code as prescribed by the protocol for initial communications with peripheral units (Figure 5.6.16).

(1) Transmit "$B0_{16}$" from a peripheral unit. If the oscillation frequency input by the main clock is 10 MHz, the MCU with internal flash memory outputs the "$B0_{16}$" check code. If the oscillation frequency is anything other than 10 MHz, the MCU does not output anything.

(2) Transmit "00_{16}" from a peripheral unit 16 times. (The MCU with internal flash memory sets the bit rate generator so that "00_{16}" can be successfully received.)

(3) The MCU with internal flash memory outputs the "$B0_{16}$" check code and initial communications end successfully *1. Initial communications must be transmitted at a speed of 9,600 bps and a transfer interval of a minimum 15 ms. Also, the baud rate at the end of initial communications is 9,600 bps.

*1. If the peripheral unit cannot receive "$B0_{16}$" successfully, change the oscillation frequency of the main clock.

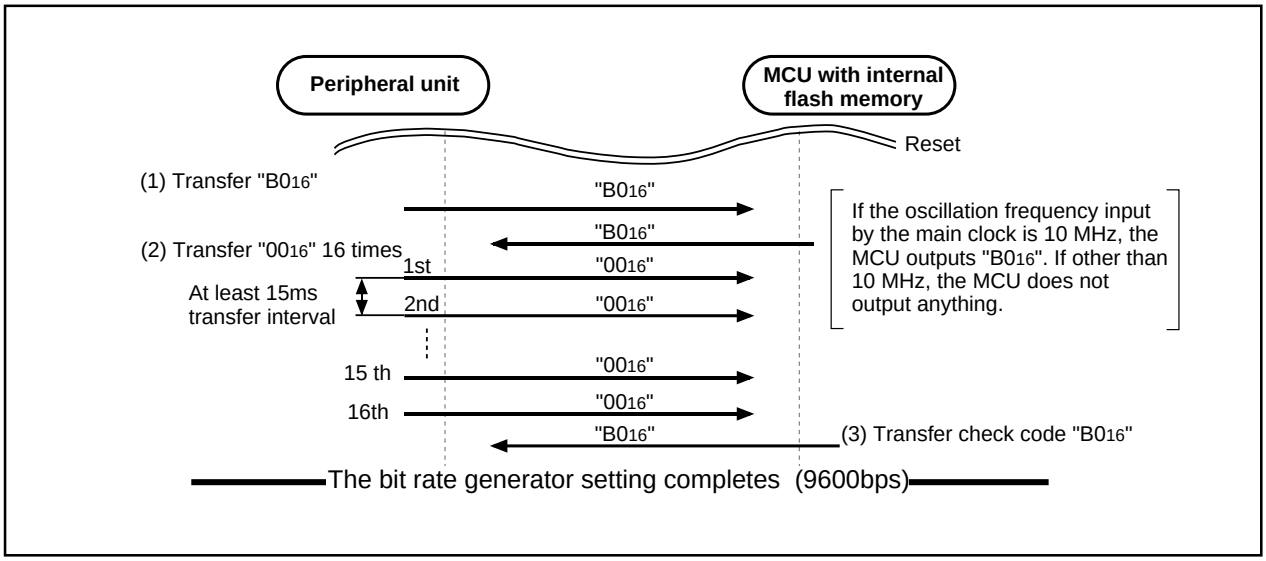


Figure 5.6.16. Peripheral unit and initial communication

How frequency is identified

When "0016" data is received 16 times from a peripheral unit at a baud rate of 9,600 bps, the value of the bit rate generator is set to match the operating frequency (2 - 10 MHz). The highest speed is taken from the first 8 transmissions and the lowest from the last 8. These values are then used to calculate the bit rate generator value for a baud rate of 9,600 bps.

Baud rate cannot be attained with some operating frequencies. Table 5.6.4 gives the operation frequency and the baud rate that can be attained for.

Table 5.6.4 Operation frequency and the baud rate

Operation frequency (MHz)	Baud rate 9,600bps	Baud rate 19,200bps	Baud rate 38,400bps	Baud rate 57,600bps
10MHz	✔	✔	–	✔
8MHz	✔	✔	–	✔

5.6.5 Software Commands

Table 5.6.5 lists software commands. In the standard serial I/O mode 2, erase operations, programs and reading are controlled by transferring software commands via the RxD_1 pin. Standard serial I/O mode 2 adds four transmission speed commands - 9,600, 19,200, 38,400 and 57,600 bps - to the software commands of standard serial I/O mode 1. Software commands are explained here below.

Table 5.6.5. Software commands (Standard serial I/O mode 2)

	Control command	1st byte transfer	2nd byte	3rd byte	4th byte	5th byte	6th byte		When ID is not verified
1	Page read	FF_{16}	Address (middle)	Address (high)	Data output	Data output	Data output	Data output to 259th byte	Not acceptable
2	Page program	41_{16}	Address (middle)	Address (high)	Data input	Data input	Data input	Data input to 259th byte	Not acceptable
3	Block erase	20_{16}	Address (middle)	Address (high)	$D0_{16}$				Not acceptable
4	Erase all unlocked blocks	$A7_{16}$	$D0_{16}$						Not acceptable
5	Read status register	70_{16}	SRD output	SRD1 output					Acceptable
6	Clear status register	50_{16}							Not acceptable
7	ID check function	$F5_{16}$	Address (low)	Address (middle)	Address (high)	ID size	ID1	To ID7	Acceptable
8	Download function	FA_{16}	Size (low)	Size (high)	Check-sum	Data input	To required number of times		Not acceptable
9	Version data output function	FB_{16}	Version data output	Version data output	Version data output	Version data output	Version data output	Version data output to 9th byte	Acceptable
10	Boot ROM area output function	FC_{16}	Address (middle)	Address (high)	Data output	Data output	Data output	Data output to 259th byte	Not acceptable
11	Read check data	FD_{16}	Check data (low)	Check data (high)					Not acceptable
12	Baud rate 9600	$B0_{16}$	$B0_{16}$						Acceptable
13	Baud rate 19200	$B1_{16}$	$B1_{16}$						Acceptable
14	Baud rate 38400	$B2_{16}$	$B2_{16}$						Acceptable
15	Baud rate 57600	$B3_{16}$	$B3_{16}$						Acceptable

Note 1: Shading indicates transfer from flash memory microcomputer to peripheral unit. All other data is transferred from the peripheral unit to the flash memory microcomputer.

Note 2: SRD refers to status register data. SRD1 refers to status register 1 data.

Note 3: All commands can be accepted when the flash memory is totally blank.

Page Read Command

This command reads the specified page (256 bytes) in the flash memory sequentially one byte at a time. Execute the page read command as explained here following.

(1) Transfer the "FF16" command code with the 1st byte.

(2) Transfer addresses A8 to A15 and A16 to A23 with the 2nd and 3rd bytes respectively.

(3) From the 4th byte onward, data (D0–D7) for the page (256 bytes) specified with addresses A8 to A23 will be output sequentially from the smallest address first.

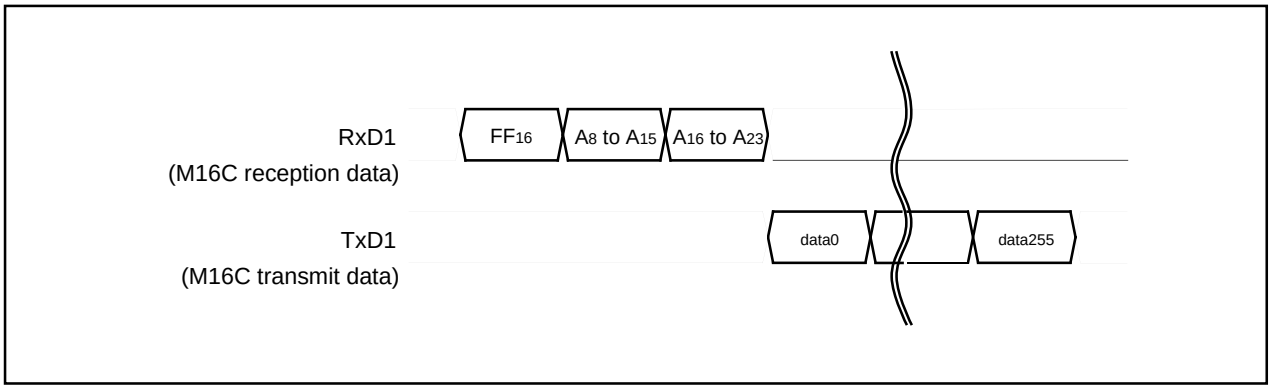

Figure 5.6.17. Timing for page read

Read Status Register Command

This command reads status information. When the "7016" command code is sent with the 1st byte, the contents of the status register (SRD) specified with the 2nd byte and the contents of status register 1 (SRD1) specified with the 3rd byte are read.

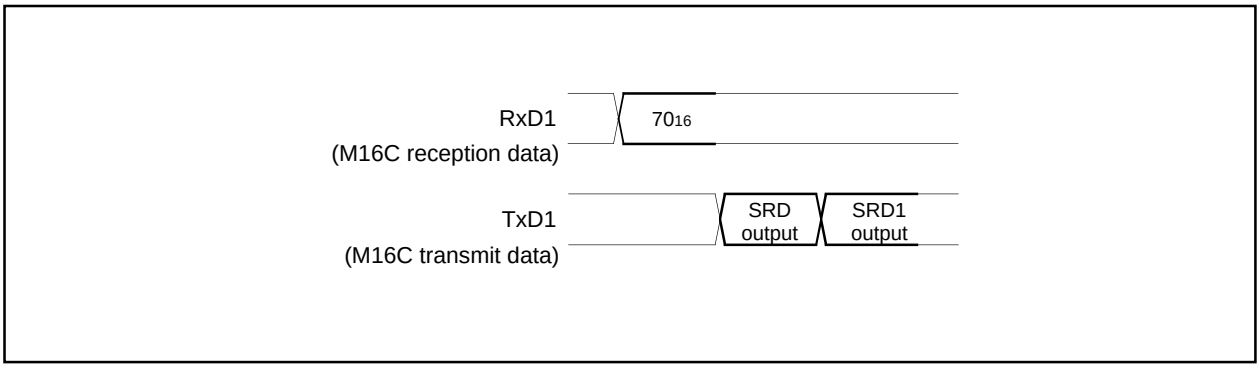

Figure 5.6.18. Timing for reading the status register

Clear Status Register Command

This command clears the bits (SR4–SR5) which are set when the status register operation ends in error. When the "50_{16}" command code is sent with the 1st byte, the aforementioned bits are cleared.

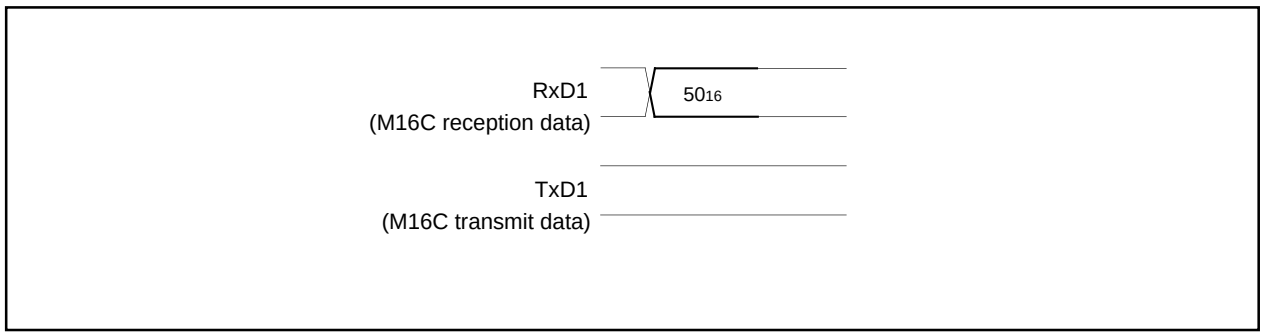

Figure 5.6.19. Timing for clearing the status register

Page Program Command

This command writes the specified page (256 bytes) in the flash memory sequentially one byte at a time. Execute the page program command as explained here following.

(1) Transfer the "41_{16}" command code with the 1st byte.

(2) Transfer addresses A_8 to A_{15} and A_{16} to A_{23} with the 2nd and 3rd bytes respectively.

(3) From the 4th byte onward, as write data (D_0–D_7) for the page (256 bytes) specified with addresses A_8 to A_{23} is input sequentially from the smallest address first, that page is automatically written.

The result of the page program can be known by reading the status register. For more information, see the section on the status register.

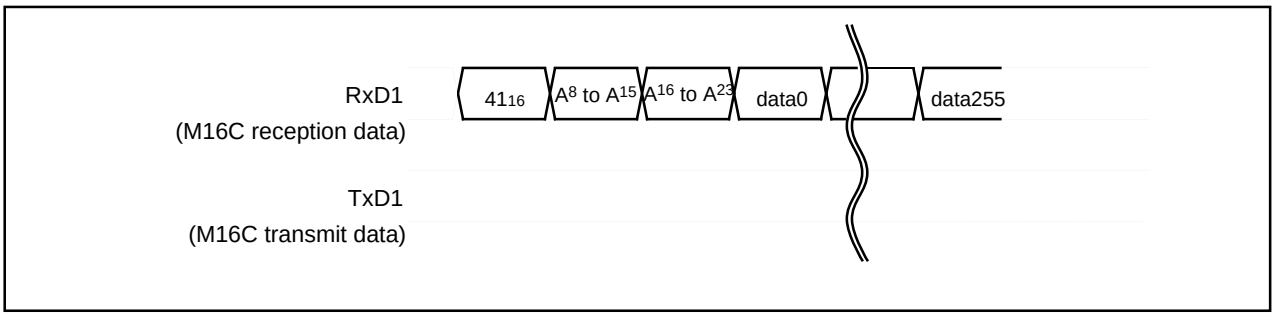

Figure 5.6.20. Timing for the page program

Block Erase Command

This command erases the data in the specified block. Execute the block erase command as explained here following.

(1) Transfer the "20_{16}" command code with the 1st byte.

(2) Transfer addresses A_8 to A_{15} and A_{16} to A_{23} with the 2nd and 3rd bytes respectively.

(3) Transfer the verify command code "$D0_{16}$" with the 4th byte. With the verify command code, the erase operation will start for the specified block in the flash memory. Write the optional even address of the specified block for addresses A_8 to A_{23}.

After block erase ends, the result of the block erase operation can be known by reading the status register. For more information, see the section on the status register.

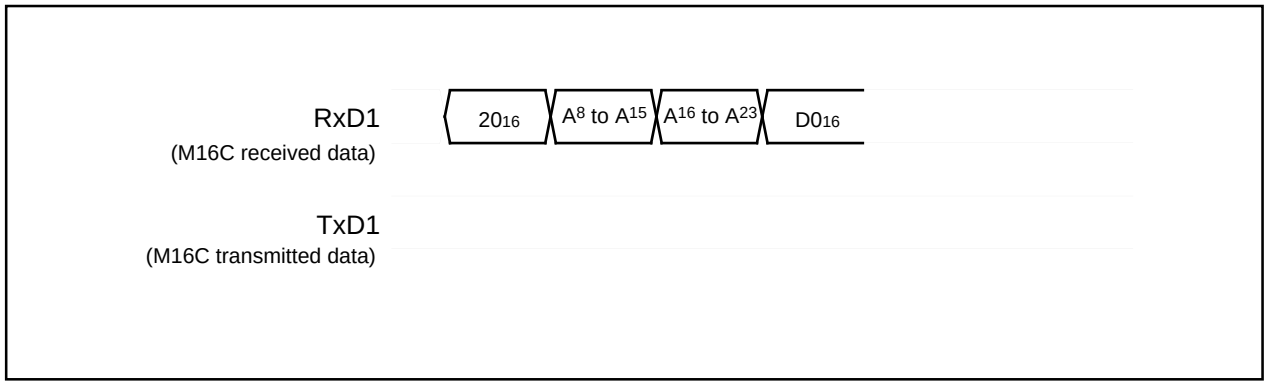

Figure 5.6.21. Timing for block erasing

Erase All Blocks Command

This command erases the content of all blocks. Execute the erase all blocks command as explained here following.

(1) Transfer the "$A7_{16}$" command code with the 1st byte.

(2) Transfer the verify command code "$D0_{16}$" with the 2nd byte. With the verify command code, the erase operation will start and continue for all blocks in the flash memory.

The result of the erase operation can be known by reading the status register.

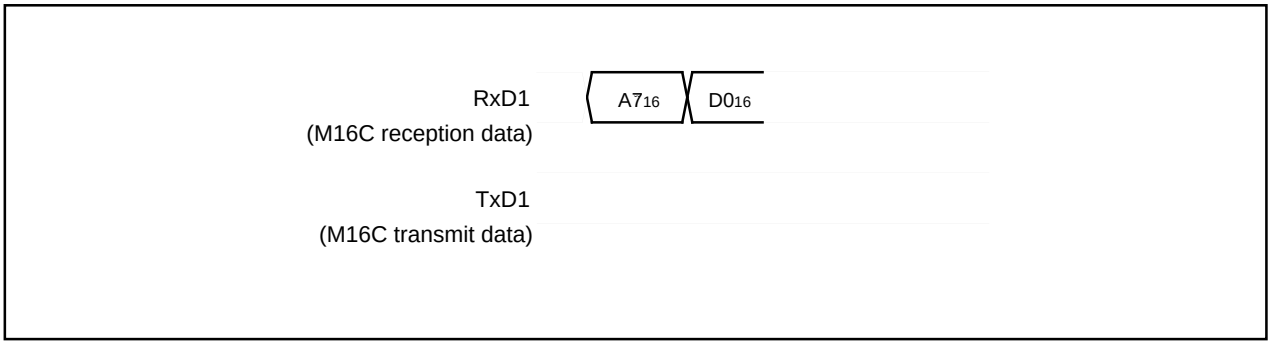

Figure 5.6.22. Timing for erasing all blocks

Download Command

This command downloads a program to the RAM for execution. Execute the download command as explained here following.

(1) Transfer the "FA_{16}" command code with the 1st byte.
(2) Transfer the program size with the 2nd and 3rd bytes.
(3) Transfer the check sum with the 4th byte. The check sum is added to all data sent with the 5th byte onward.
(4) The program to execute is sent with the 5th byte onward.

When all data has been transmitted, if the check sum matches, the downloaded program is executed. The size of the program will vary according to the internal RAM.

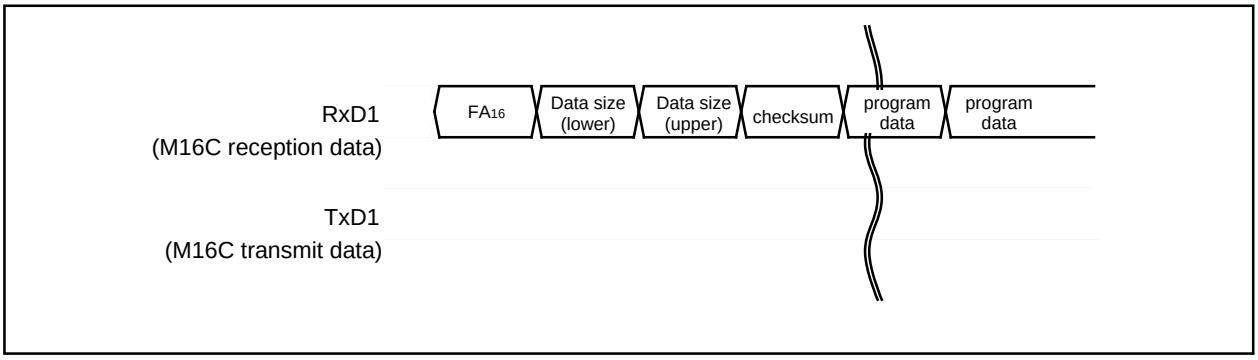

Figure 5.6.23. Timing for download

Version Information Output Command

This command outputs the version information of the control program stored in the boot area. Execute the version information output command as explained here following.

(1) Transfer the "FB_{16}" command code with the 1st byte.

(2) The version information will be output from the 2nd byte onward. This data is composed of 8 ASCII code characters.

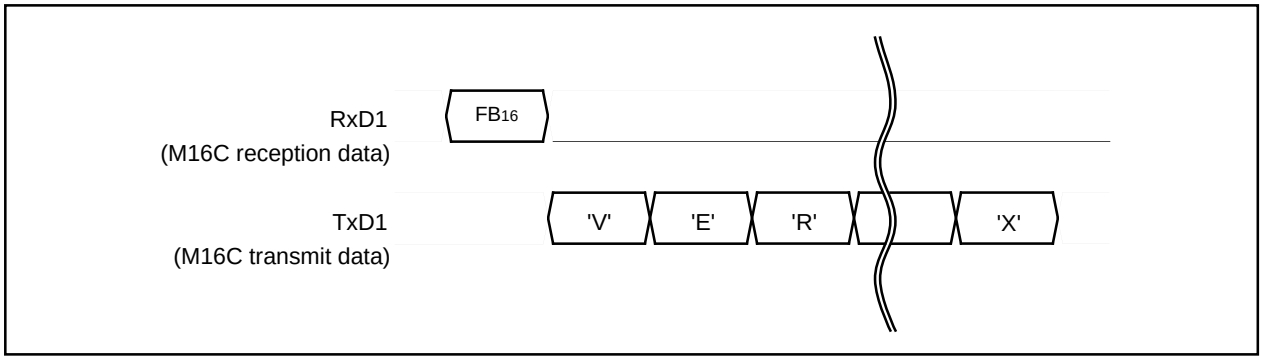

Figure 5.6.24. Timing for version information output

Boot ROM Area Output Command

This command outputs the control program stored in the boot ROM area in one page blocks (256 bytes). Execute the boot ROM area output command as explained here following.

(1) Transfer the "FC_{16}" command code with the 1st byte.

(2) Transfer addresses A_8 to A_{15} and A_{16} to A_{23} with the 2nd and 3rd bytes respectively.

(3) From the 4th byte onward, data (D_0–D_7) for the page (256 bytes) specified with addresses A_8 to A_{23} will be output sequentially from the smallest address first.

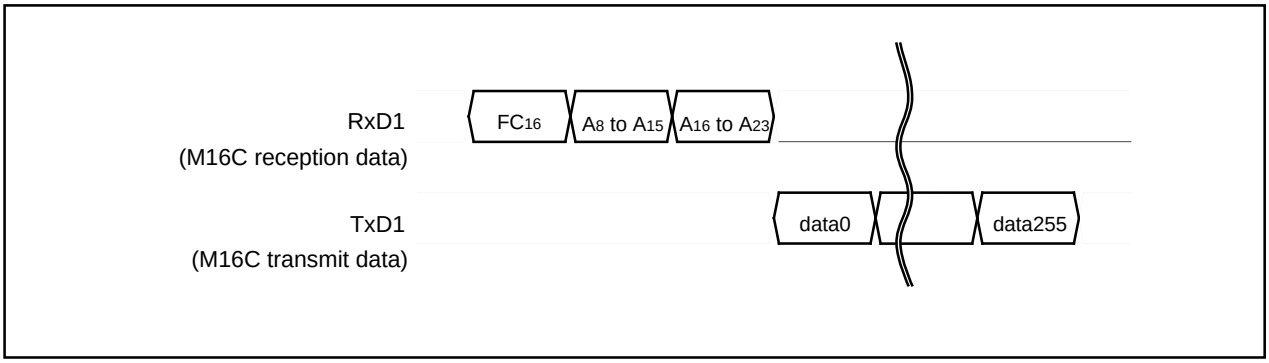

Figure 5.6.25. Timing for boot ROM area output

ID Check

This command checks the ID code. Execute the boot ID check command as explained here following.

(1) Transfer the "F5$_{16}$" command code with the 1st byte.

(2) Transfer addresses A$_0$ to A$_7$, A$_8$ to A$_{15}$ and A$_{16}$ to A$_{23}$ of the 1st byte of the ID code with the 2nd, 3rd and 4th bytes respectively.

(3) Transfer the number of data sets of the ID code with the 5th byte.

(4) The ID code is sent with the 6th byte onward, starting with the 1st byte of the code.

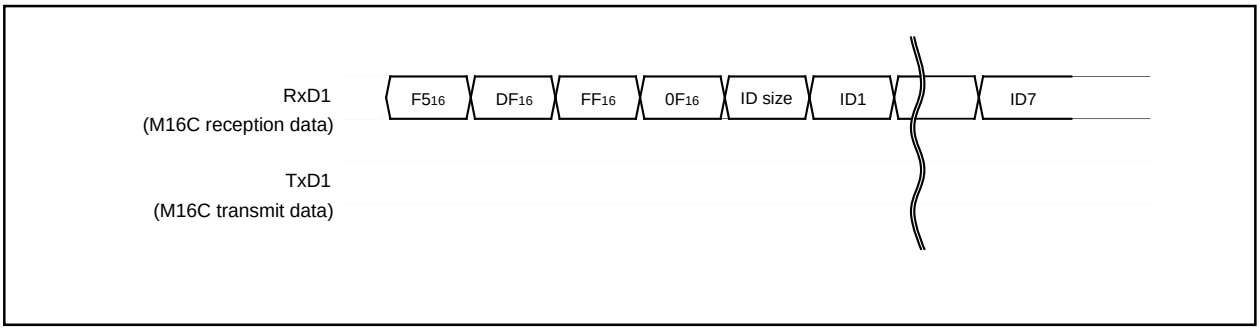

Figure 5.6.26. Timing for the ID check

ID Code

When the flash memory is not blank, the ID code sent from the peripheral units and the ID code written in the flash memory are compared to see if they match. If the codes do not match, the command sent from the peripheral units is not accepted. An ID code contains 8 bits of data. Area is, from the 1st byte, addresses 0FFFDF$_{16}$, 0FFFE3$_{16}$, 0FFFEB$_{16}$, 0FFFEF$_{16}$, 0FFFF3$_{16}$, 0FFFF7$_{16}$ and 0FFFFB$_{16}$. Write a program into the flash memory, which already has the ID code set for these addresses.

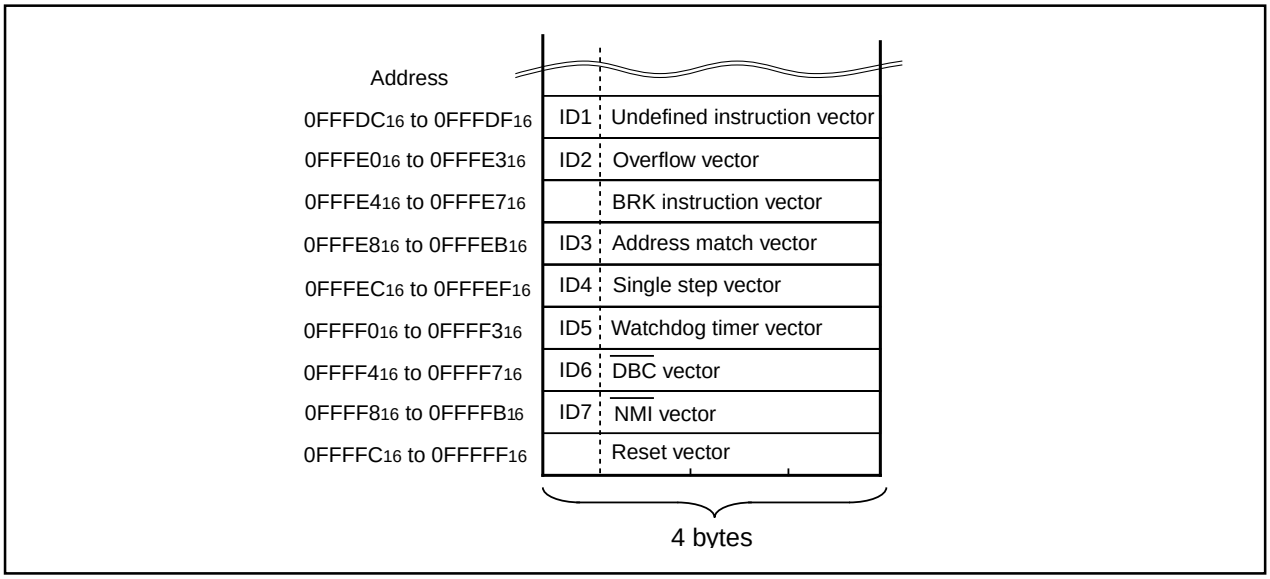

Figure 5.6.27. ID code storage addresses

Read Check Data

This command reads the check data that confirms that the write data, which was sent with the page program command, was successfully received.

(1) Transfer the "FD16" command code with the 1st byte.

(2) The check data (low) is received with the 2nd byte and the check data (high) with the 3rd.

To use this read check data command, first execute the command and then initialize the check data. Next, execute the page program command the required number of times. After that, when the read check command is executed again, the check data for all of the read data that was sent with the page program command during this time is read. Check data adds write data in 1 byte units and obtains the two's-compliment of the insignificant 2 bytes of the accumulated data.

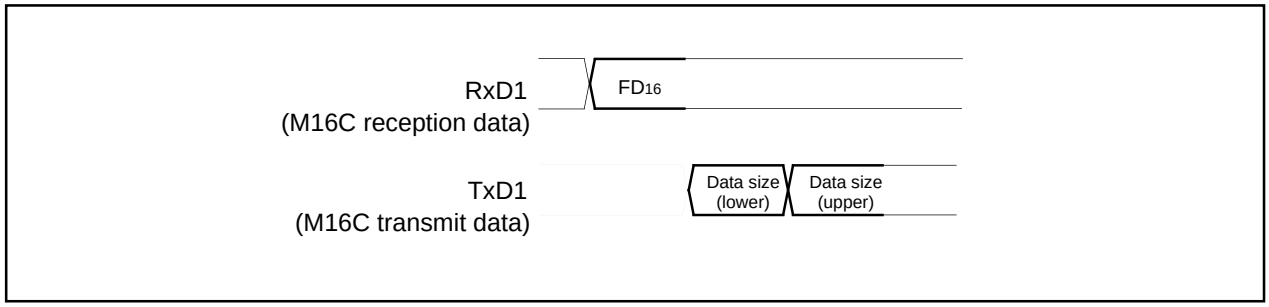

Figure 5.6.28. Timing for the read check data

Baud Rate 9600

This command changes baud rate to 9,600 bps. Execute it as follows.

(1) Transfer the "B016" command code with the 1st byte.

(2) After the "B016" check code is output with the 2nd byte, change the baud rate to 9,600 bps.

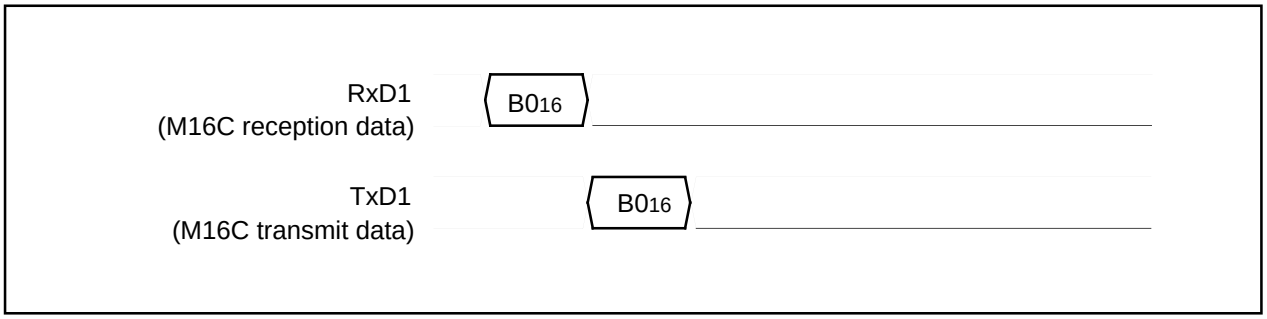

Figure 5.6.29. Timing of baud rate 9600

Baud Rate 19200

This command changes baud rate to 19,200 bps. Execute it as follows.

(1) Transfer the "B1$_{16}$" command code with the 1st byte.

(2) After the "B1$_{16}$" check code is output with the 2nd byte, change the baud rate to 19,200 bps.

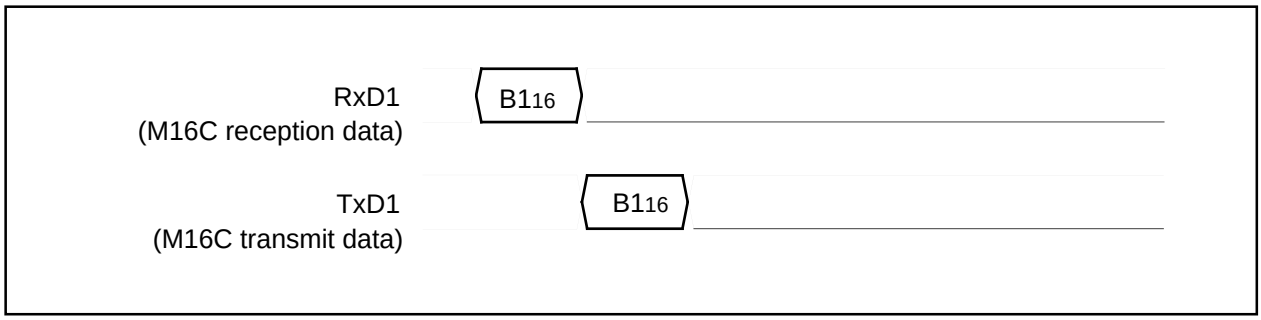

Figure 5.6.30. Timing of baud rate 19200

Baud Rate 38400

This command changes baud rate to 38,400 bps. Execute it as follows.

(1) Transfer the "B2$_{16}$" command code with the 1st byte.

(2) After the "B2$_{16}$" check code is output with the 2nd byte, change the baud rate to 38,400 bps.

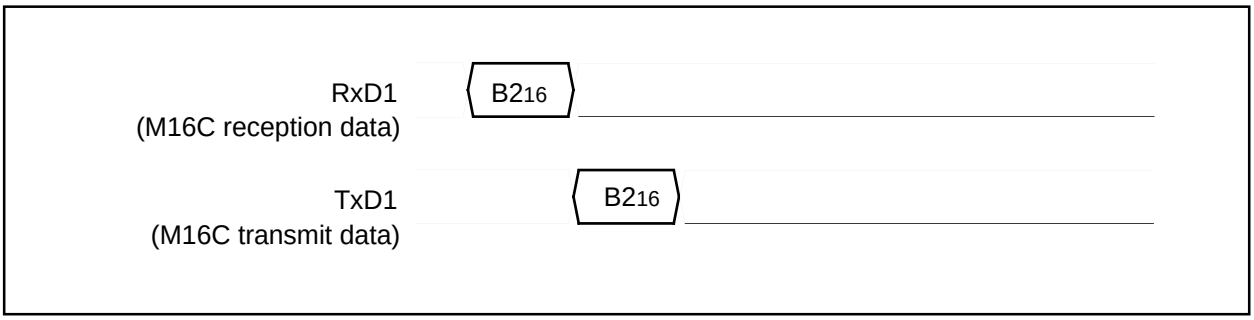

Figure 5.6.31. Timing of baud rate 38400

Baud Rate 57600

This command changes baud rate to 57,600 bps. Execute it as follows.

(1) Transfer the "B3$_{16}$" command code with the 1st byte.

(2) After the "B3$_{16}$" check code is output with the 2nd byte, change the baud rate to 57,600 bps.

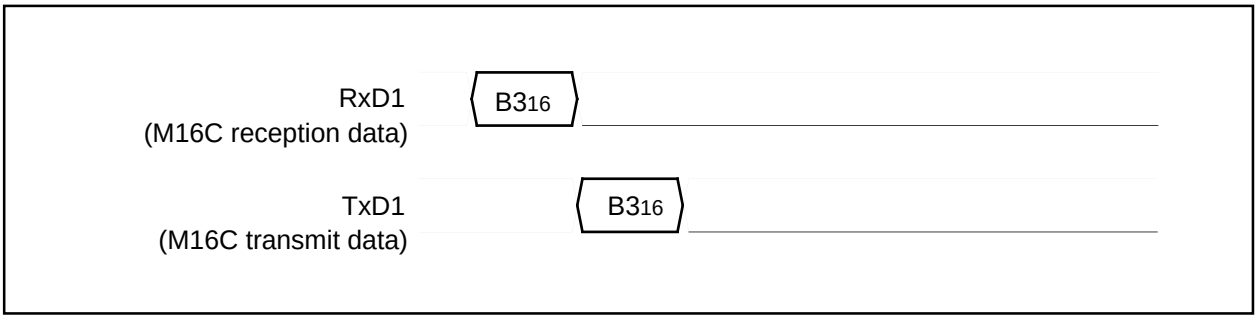

Figure 5.6.32. Timing of baud rate 57600

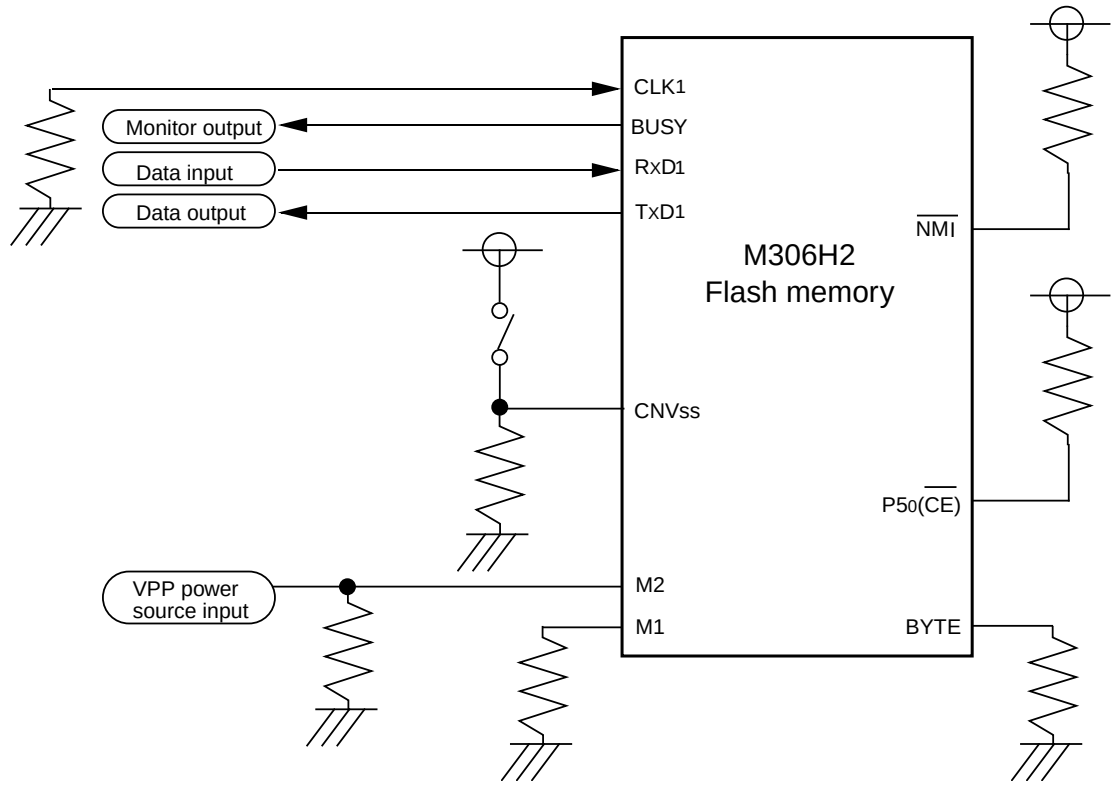
5.6.6 Example Circuit Application for The Standard Serial I/O Mode 2

The below figure shows a circuit application for the standard serial I/O mode 2.



(1) In this example, the Vpp power supply is supplied from an external source (writer). To use the user's power source, connect to 4.75V to 5.25 V.
(2) In this example, microcomputer mode and standard serial I/O mode are changed with a switch.

Figure 5.6.23. Example circuit application for the standard serial I/O mode 2

5.7 Electrical Characteristics

Table 5.7.1 Absolute maximum ratings

Symbol	Parameter		Condition	Rated value	Unit
Vcc	Supply voltage		Vcc=AVcc	- 0.3 to 5.75	V
AVcc	Analog supply voltage		Vcc=AVcc	- 0.3 to 5.75	V
M2	Supply voltage for program/erase			- 0.3 to 5.75	V
V_I	Input voltage	$\overline{RESET}$, CNV_{SS}, BYTE, $P0_0$ to $P0_7$, $P1_0$ to $P1_7$, $P2_0$ to $P2_7$, $P3_0$ to $P3_7$, $P4_0$ to $P4_7$, $P5_0$ to $P5_7$, $P6_0$ to $P6_7$, $P7_2$ to $P7_7$, $P8_0$ to $P8_7$, $P9_0$ to $P9_7$, $P10_0$ to $P10_7$, V_{REF}, X_{IN}, M1		- 0.3 to Vcc+0.3	V
		$P7_0$, $P7_1$		- 0.3 to 5.75	V
V_O	Output voltage	$P0_0$ to $P0_7$, $P1_0$ to $P1_7$, $P2_0$ to $P2_7$, $P3_0$ to $P3_7$, $P4_0$ to $P4_7$, $P5_0$ to $P5_7$, $P6_0$ to $P6_7$, $P7_2$ to $P7_7$, $P8_0$ to $P8_4$, $P8_6$, $P8_7$, $P9_0$ to $P9_7$, $P10_0$ to $P10_7$, X_{OUT}, P11		- 0.3 to Vcc+0.3	V
		$P7_0$, $P7_1$,		- 0.3 to 5.75	V
P_d	Power dissipation		Ta=25 °C	1000	mW
T_{opr}	Operating ambient temperature (Note)			25 ± 5	°C
T_{stg}	Storage temperature			- 40 to 125	°C

Note: It is a value in flash memory mode. Other parameter becomes same as a value in microcomputer mode.

Table 5.7.2 DC electrical characteristics (referenced to V_{CC} = 5.0V at Ta = 25°C unless otherwise specified)

Symbol	Parameter	Condition	Rated value			Unit
			Min.	Typ.	Max.	
I_{PP1}	V_{PP} power supply current (at read)	V_{PP} =V_{CC}			100	µA
I_{PP2}	V_{PP} power supply current (at program)	V_{PP} =V_{CC}			60	mA
I_{PP3}	V_{PP} power supply current (at erase)	V_{PP} =V_{CC}			70	mA
V_{PP}	V_{PP} power supply voltage		4.75		5.25	V

7. DIFFERENCES BETWEEN M306H2MC-XXXFP AND M306H2FCFP

Item	M306H2MC-XXXFP	M306H2FCFP
Processor mode	Single-chip mode Memory extension mode Microprocessor mode(Note 1)	Single-chip mode Memory expansion mode
ROM type	Mask ROM	Flash memory
M1/M2 pin function	M1: Test input (Connect it to the Vss pin.)	M1: Chip mode setting input (Note 2)
	M2: Test input (Connect it to the Vss pin.)	M2: Flash memory rewriting power supply input
CNVss pin function	This pin switches between processor modes.	Normally connect it to the Vss pin.(Note 2)
BYTE pin function	This pin switches between external data buses.	This pin switches between external data buses. (Note 3)

Notes 1: Microprocessor mode can be used only on M306H2MC-XXXFP.
2: These pins are used to control flash memory mode. For more information, consult M306H2FCFP flash memory specifications.
3 :When use flash memory mode (parallel I/O, standard serial I/O and CPU rewriting mode), connect with VSS pin.
4 :Since it differs in part about an electrical characteristics, check the specification of M306H2MC-XXXFP and M306H2FCFP.
5 :There are differences in electric characteristics, operation margin, noise immunity, and noise radiation between Mask ROM and Flash Memory version MCUs due to the difference in the manufacturing processes. When manufacturing an application system with the Flash Memory version and then switching to use of the Mask ROM version, please perform sufficient evaluations for the commercial samples of the Mask ROM version.
