

**Revision History****AS4C4M16D1A - 66-pin TSOPII PACKAGE**

Revision	Details	Date
Rev 1.1	Preliminary datasheet	July 2015

## Features

- Fast clock rate: 200 MHz
- Differential Clock CK &  $\overline{CK}$
- Bi-directional DQS
- DLL enable/disable by EMRS
- Fully synchronous operation
- Internal pipeline architecture
- Four internal banks, 1M x 16-bit for each bank
- Programmable Mode and Extended Mode Registers
  - CAS Latency: 2, 2.5, 3
  - Burst length: 2, 4, 8
  - Burst Type: Sequential & Interleaved
- Individual byte writes mask control
- DM Write Latency = 0
- Auto Refresh and Self Refresh
- 4096 refresh cycles / 64ms
- Precharge & active power down
- Power supplies:  $V_{DD}$  &  $V_{DDQ} = 2.5V \pm 0.2V$
- Operating temperature:
  - Commercial (0°C~70°C)
  - Industrial (-40°C~85°C)
- Interface: SSTL\_2 I/O Interface
- Package: 66 Pin TSOP II, 0.65mm pin pitch
  - Pb free and Halogen free

## Overview

The AS4C4M16D1 DDR SDRAM is a high-speed CMOS double data rate synchronous DRAM containing 64 Mbits. It is internally configured as a quad 1M x 16 DRAM with a synchronous interface (all signals are registered on the positive edge of the clock signal, CK). Data outputs occur at both rising edges of CK and  $\overline{CK}$ . Read and write accesses to the SDRAM are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of a BankActivate command which is then followed by a Read or Write command.

The AS4C4M16D1 provides programmable Read or Write burst lengths of 2, 4, 8. An auto precharge function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst sequence. The refresh functions, either Auto or Self Refresh are easy to use. In addition, AS4C4M16D1 features programmable DLL option. By having a programmable mode register and extended mode register, the system can choose the most suitable modes to maximize its performance. These devices are well suited for applications requiring high memory bandwidth and high performance.

**Table 1. Ordering Information**

Product part No	Clock	Temperature	Data Rate	Package
AS4C4M16D1A-5TCN	200MHz	Commercial 0°C to 70°C	400Mbps/pin	66pin TSOPII
AS4C4M16D1A-5TIN	200MHz	Industrial -40°C to 85°C	400Mbps/pin	66pin TSOPII

## Pin Descriptions

**Table 2. Pin Details**

Symbol	Type	Description
CK, $\overline{CK}$	Input	<b>Differential Clock:</b> CK and $\overline{CK}$ are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of $\overline{CK}$ . Input and output data is referenced to the crossing of CK and $\overline{CK}$ (both directions of the crossing)
CKE	Input	<b>Clock Enable:</b> CKE activates (HIGH) and deactivates (LOW) the CK signal. If CKE goes low synchronously with clock, the internal clock is suspended from the next clock cycle and the state of output and burst address is frozen as long as the CKE remains low. When all banks are in the idle state, deactivating the clock controls the entry to the Power Down and Self Refresh modes.
BA0, BA1	Input	<b>Bank Activate:</b> BA0 and BA1 define to which bank the BankActivate, Read, Write, or BankPrecharge command is being applied.
A0-A11	Input	<b>Address Inputs:</b> A0-A11 are sampled during the BankActivate command (row address A0-A11) and Read/Write command (column address A0-A7 with A10 defining Auto Precharge).
$\overline{CS}$	Input	<b>Chip Select:</b> $\overline{CS}$ enables (sampled LOW) and disables (sampled HIGH) the command decoder. All commands are masked when $\overline{CS}$ is sampled HIGH. $\overline{CS}$ provides for external bank selection on systems with multiple banks. It is considered part of the command code.
$\overline{RAS}$	Input	<b>Row Address Strobe:</b> The $\overline{RAS}$ signal defines the operation commands in conjunction with the $\overline{CAS}$ and $\overline{WE}$ signals and is latched at the positive edges of CK. When $\overline{RAS}$ and $\overline{CS}$ are asserted "LOW" and $\overline{CAS}$ is asserted "HIGH," either the BankActivate command or the Precharge command is selected by the $\overline{WE}$ signal. When the $\overline{WE}$ is asserted "HIGH," the BankActivate command is selected and the bank designated by BA is turned on to the active state. When the $\overline{WE}$ is asserted "LOW," the Precharge command is selected and the bank designated by BA is switched to the idle state after the precharge operation.
$\overline{CAS}$	Input	<b>Column Address Strobe:</b> The $\overline{CAS}$ signal defines the operation commands in conjunction with the $\overline{RAS}$ and $\overline{WE}$ signals and is latched at the positive edges of CK. When $\overline{RAS}$ is held "HIGH" and $\overline{CS}$ is asserted "LOW," the column access is started by asserting $\overline{CAS}$ "LOW." Then, the Read or Write command is selected by asserting $\overline{WE}$ "HIGH" or "LOW."
$\overline{WE}$	Input	<b>Write Enable:</b> The $\overline{WE}$ signal defines the operation commands in conjunction with the $\overline{RAS}$ and $\overline{CAS}$ signals and is latched at the positive edges of CK. The $\overline{WE}$ input is used to select the BankActivate or Precharge command and Read or Write command.
LDQS, UDQS	Input / Output	<b>Bidirectional Data Strobe:</b> Specifies timing for Input and Output data. Read Data Strobe is edge triggered. Write Data Strobe provides a setup and hold time for data and DQM. LDQS is for DQ0~7, UDQS is for DQ8~15.
LDM, UDM	Input	<b>Data Input Mask:</b> Input data is masked when DM is sampled HIGH during a write cycle. LDM masks DQ0-DQ7, UDM masks DQ8-DQ15.
DQ0 - DQ15	Input / Output	<b>Data I/O:</b> The DQ0-DQ15 input and output data are synchronized with positive and negative edges of LDQS & UDQS. The I/Os are byte-maskable during Writes.
V <sub>DD</sub>	Supply	<b>Power Supply:</b> +2.5V ±0.2V

V <sub>SS</sub>	Supply	Ground
V <sub>DDQ</sub>	Supply	<b>DQ Power:</b> +2.5V ±0.2V. Provide isolated power to DQs for improved noise immunity.
V <sub>SSQ</sub>	Supply	<b>DQ Ground:</b> Provide isolated ground to DQs for improved noise immunity.
V <sub>REF</sub>	Supply	<b>Reference Voltage for Inputs:</b> +0.5*V <sub>DDQ</sub>
NC	-	<b>No Connect:</b> No internal connection, these pins suggest to be left unconnected.

## Operation Mode

Table 3 shows the truth table for the operation commands.

**Table 3. Truth Table (Note (1), (2))**

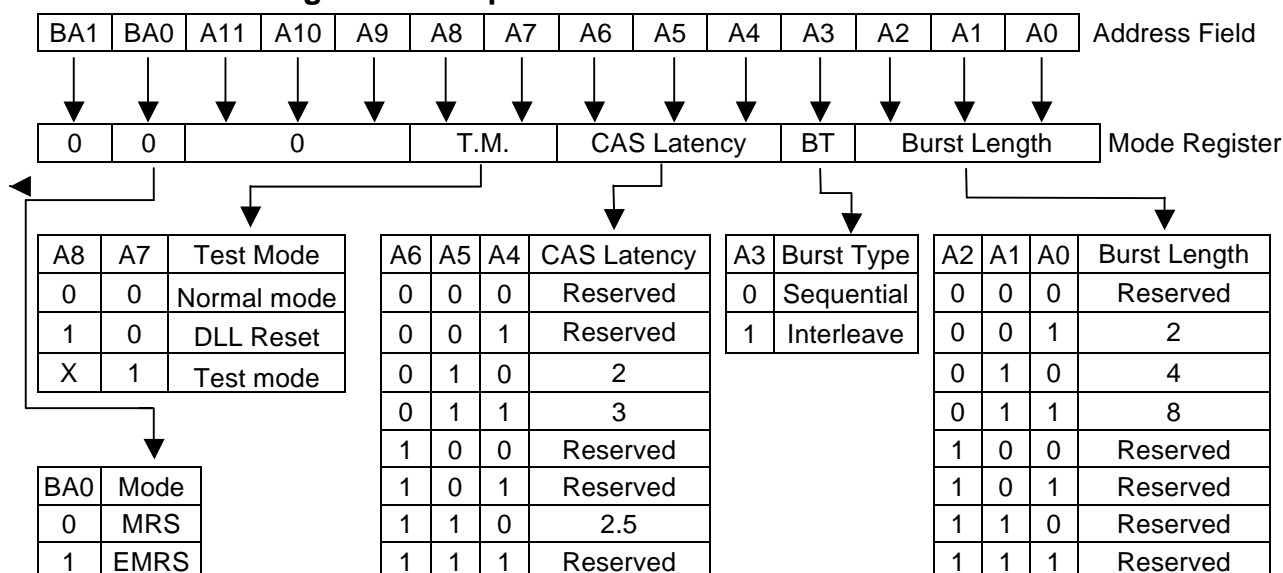

Command	State	CKE <sub>n-1</sub>	CKE <sub>n</sub>	DM	BA0,1	A10	A0-9,11	$\overline{\text{CS}}$	$\overline{\text{RAS}}$	$\overline{\text{CAS}}$	$\overline{\text{WE}}$
BankActivate	Idle <sup>(3)</sup>	H	X	X	V	Row address		L	L	H	H
BankPrecharge	Any	H	X	X	V	L	X	L	L	H	L
PrechargeAll	Any	H	X	X	X	H	X	L	L	H	L

Precharge Power Down Mode Exit	Any (PowerDown)	L	H	X	X	X	X	H	X	X	X
								L	H	H	H
Active Power Down Mode Entry	Active	H	L	X	X	X	X	H	X	X	X
								L	V	V	V
Active Power Down Mode Exit	Any (PowerDown)	L	H	X	X	X	X	H	X	X	X
								L	H	H	H
Data Input Mask Disable	Active	H	X	L	X	X	X	X	X	X	X
Data Input Mask Enable <sup>(5)</sup>	Active	H	X	H	X	X	X	X	X	X	X

- Note:**
1. V=Valid data, X=Don't Care, L=Low level, H=High level
  2. CKE<sub>n</sub> signal is input level when commands are provided.  
CKE<sub>n-1</sub> signal is input level one clock cycle before the commands are provided.
  3. These are states of bank designated by BA signal.
  4. Device state is 2, 4, 8, burst operation.
  5. LDM and UDM can be enabled respectively.

## Mode Register Set (MRS)

The Mode Register stores the data for controlling various operating modes of a DDR SDRAM. It programs CAS Latency, Burst Type, and Burst Length to make the DDR SDRAM useful for a variety of applications. The default value of the Mode Register is not defined; therefore the Mode Register must be written by the user. Values stored in the register will be retained until the register is reprogrammed. The Mode Register is written by asserting Low on  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$ , BA1 and BA0 (the device should have all banks idle with no bursts in progress prior to writing into the mode register, and CKE should be High). The state of address pins A0~A11 and BA0, BA1 in the same cycle in which  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$  and  $\overline{WE}$  are asserted Low is written into the Mode Register. A minimum of two clock cycles, tMRD, are required to complete the write operation in the Mode Register. The Mode Register is divided into various fields depending on functionality. The Burst Length uses A0~A2, Burst Type uses A3, and CAS Latency (read latency from column address) uses A4~A6. A logic 0 should be programmed to all the undefined addresses to ensure future compatibility. Reserved states should not be used to avoid unknown device operation or incompatibility with future versions. Refer to the table for specific codes for various burst lengths, burst types and CAS latencies.

**Table 4. Mode Register Bitmap**

- Burst Length Field (A2~A0)**

This field specifies the data length of column access using the A2~A0 pins and selects the Burst Length to be 2, 4, and 8.

**Table 5. Burst Length**

A2	A1	A0	Burst Length
0	0	0	Reserved
0	0	1	2
0	1	0	4
0	1	1	8
1	0	0	Reserved
1	0	1	Reserved
1	1	0	Reserved
1	1	1	Reserved

- Addressing Mode Select Field (A3)

The Addressing Mode can be one of two modes, either Interleave Mode or Sequential Mode. Both Sequential Mode and Interleave Mode support burst length of 2, 4, and 8.

**Table 6. Addressing Mode**

A3	Addressing Mode
0	Sequential
1	Interleave

- Burst Definition, Addressing Sequence of Sequential and Interleave Mode

**Table 7. Burst Address ordering**

Burst Length	Start Address			Sequential	Interleave
	A2	A1	A0		
2	X	X	0	0, 1	0, 1
	X	X	1	1, 0	1, 0
4	X	0	0	0, 1, 2, 3	0, 1, 2, 3
	X	0	1	1, 2, 3, 0	1, 0, 3, 2
	X	1	0	2, 3, 0, 1	2, 3, 0, 1
	X	1	1	3, 0, 1, 2	3, 2, 1, 0
8	0	0	0	0, 1, 2, 3, 4, 5, 6, 7	0, 1, 2, 3, 4, 5, 6, 7
	0	0	1	1, 2, 3, 4, 5, 6, 7, 0	1, 0, 3, 2, 5, 4, 7, 6
	0	1	0	2, 3, 4, 5, 6, 7, 0, 1	2, 3, 0, 1, 6, 7, 4, 5
	0	1	1	3, 4, 5, 6, 7, 0, 1, 2	3, 2, 1, 0, 7, 6, 5, 4
	1	0	0	4, 5, 6, 7, 0, 1, 2, 3	4, 5, 6, 7, 0, 1, 2, 3
	1	0	1	5, 6, 7, 0, 1, 2, 3, 4	5, 4, 7, 6, 1, 0, 3, 2
	1	1	0	6, 7, 0, 1, 2, 3, 4, 5	6, 7, 4, 5, 2, 3, 0, 1
	1	1	1	7, 0, 1, 2, 3, 4, 5, 6	7, 6, 5, 4, 3, 2, 1, 0

- CAS Latency Field (A6~A4)

This field specifies the number of clock cycles from the assertion of the Read command to the first read data. The minimum whole value of CAS Latency depends on the frequency of CK. The minimum whole value satisfying the following formula must be programmed into this field.  $t_{CAC}(\text{min}) \leq \text{CAS Latency} \times t_{CK}$

**Table 8. CAS Latency**

A6	A5	A4	CAS Latency
0	0	0	Reserved
0	0	1	Reserved
0	1	0	2 clocks
0	1	1	3 clocks
1	0	0	Reserved
1	0	1	Reserved
1	1	0	2.5 clocks
1	1	1	Reserved

- Test Mode Field (A8~A7)

These two bits are used to enter the test mode and must be programmed to "00" in normal operation.

**Table 9. Test Mode**

A8	A7	Test Mode
0	0	Normal mode
1	0	DLL Reset
X	1	Test mode

- (BA0, BA1)

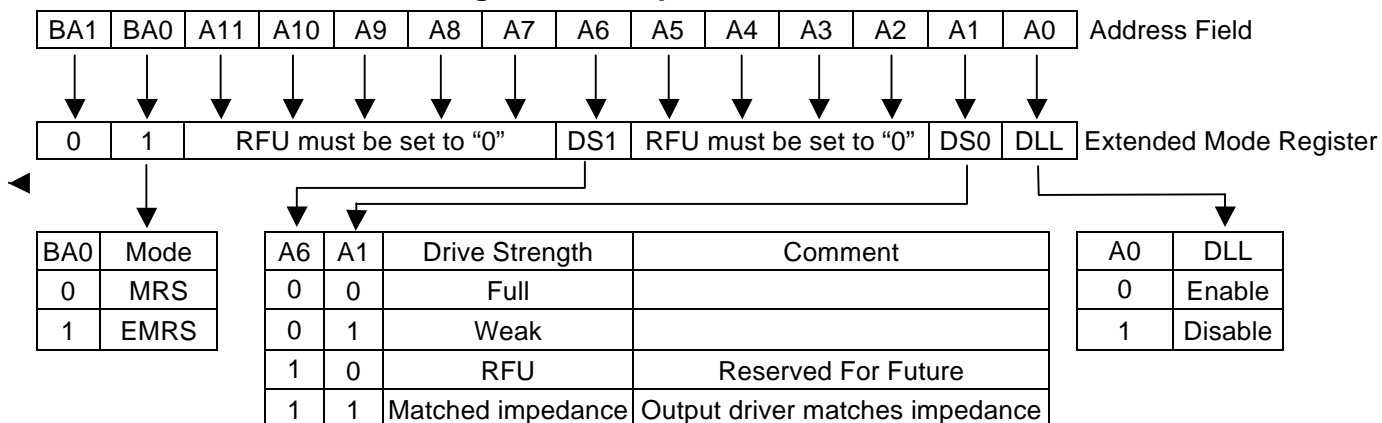

**Table 10. MRS/EMRS**

BA1	BA0	A11 ~ A0
RFU	0	MRS Cycle
RFU	1	Extended Functions (EMRS)

## Extended Mode Register Set (EMRS)

The Extended Mode Register Set stores the data for enabling or disabling DLL and selecting output driver strength. The default value of the extended mode register is not defined, therefore must be written after power up for proper operation. The extended mode register is written by asserting low on  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$ , and  $\overline{WE}$ . The state of A0 ~ A11, BA0 and BA1 is written in the mode register in the same cycle as  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$ , and  $\overline{WE}$  going low. (the device should have all banks idle with no bursts in progress prior to writing into the mode register, and CKE should be High). A1 is used for setting driver strength to normal, or weak. Two clock cycles are required to complete the write operation in the extended mode register. The mode register contents can be changed using the same command and clock cycle requirements during operation as long as all banks are in the idle state. A0 is used for DLL enable or disable. "High" on BA0 is used for EMRS. Refer to the table for specific codes.

**Table 11. Extended Mode Register Bitmap**

**Table 12. Absolute Maximum Rating**

Symbol	Item	Rating	Unit	Note
		-5		
V <sub>IN</sub> , V <sub>OUT</sub>	I/O Pins Voltage	- 0.5~V <sub>DDQ</sub> + 0.5	V	1,2
V <sub>DD</sub> , V <sub>DDQ</sub>	Power Supply Voltage	- 1~3.6	V	1,2
T <sub>A</sub>	Ambient Temperature	Commercial	0~70	°C
		Industrial	- 40~85	°C
T <sub>STG</sub>	Storage Temperature	- 55~150	°C	1
P <sub>D</sub>	Power Dissipation	1	W	1
I <sub>OS</sub>	Short Circuit Output Current	50	mA	1

Note1. Stress greater than those listed under “Absolute Maximum Ratings” may cause permanent damage of the devices

Note2. All voltages are referenced to V<sub>SS</sub>.

**Table 13. Recommended D.C. Operating Conditions (V<sub>DD</sub> = 2.5V ± 0.2V, T<sub>A</sub> = -40~85 °C)**

Symbol	Parameter	Min.	Max.	Unit
V <sub>DD</sub>	Power Supply Voltage	2.3	2.7	V
V <sub>DDQ</sub>	Power Supply Voltage (for I/O Buffer)	2.3	2.7	V
V <sub>REF</sub>	Input Reference Voltage	0.49* V <sub>DDQ</sub>	0.51* V <sub>DDQ</sub>	V
V <sub>TT</sub>	Termination Voltage	V <sub>REF</sub> - 0.04	V <sub>REF</sub> + 0.04	V
V <sub>IH</sub> (DC)	Input High Voltage (DC)	V <sub>REF</sub> + 0.15	V <sub>DDQ</sub> + 0.3	V
V <sub>IL</sub> (DC)	Input Low Voltage (DC)	-0.3	V <sub>REF</sub> - 0.15	V
V <sub>IN</sub> (DC)	Input Voltage Level, CK and $\overline{CK}$ inputs	-0.3	V <sub>DDQ</sub> + 0.3	V
V <sub>ID</sub> (DC)	Input Different Voltage, CK and $\overline{CK}$ inputs	0.36	V <sub>DDQ</sub> + 0.6	V
I <sub>IL</sub>	Input leakage current	-2	2	μA
I <sub>OZ</sub>	Output leakage current	-5	5	μA
I <sub>OH</sub>	Output High Current (V <sub>OH</sub> = 1.95V)	-16.2	-	mA
I <sub>OL</sub>	Output Low Current (V <sub>OL</sub> = 0.35V)	16.2	-	mA

**Table 14. Capacitance (V<sub>DD</sub> = 2.5V, f = 1MHz, T<sub>A</sub> = 25 °C)**

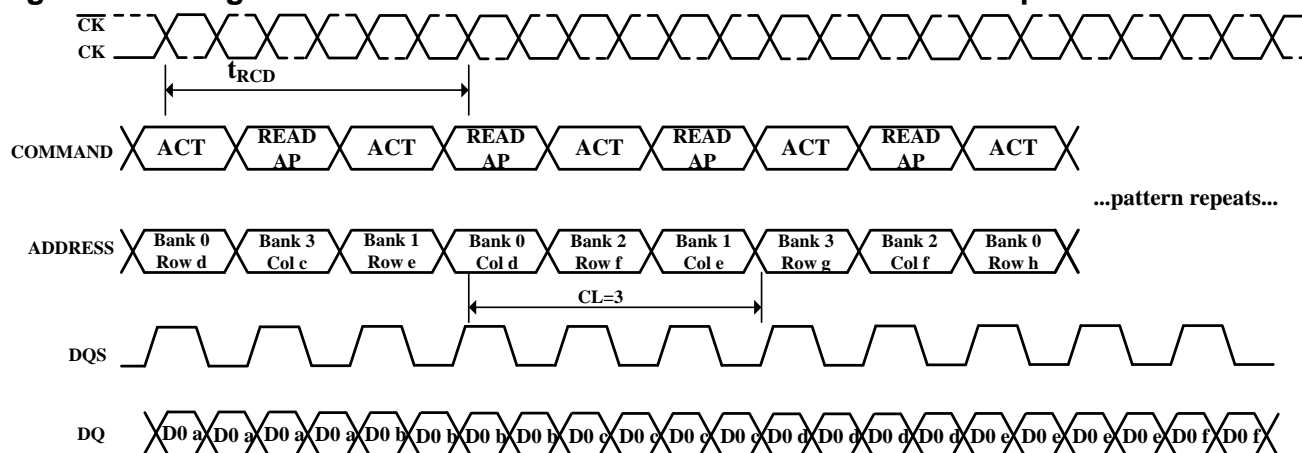

Symbol	Parameter	Min.	Max.	Unit
C <sub>IN1</sub>	Input Capacitance (CK, $\overline{CK}$ )	2	3	pF
C <sub>IN2</sub>	Input Capacitance (All other input-only pins)	2	3	pF
C <sub>I/O</sub>	DM, DQ, DQS Input/Output Capacitance	4	5	pF

Note. These parameters are guaranteed by design, periodically sampled and are not 100% tested.

**Table 15. D.C. Characteristics** ( $V_{DD} = 2.5V \pm 0.2V$ ,  $T_A = -40 \sim 85^\circ C$ )

Parameter & Test Condition	Symbol	-5	Unit
		Max.	
<b>OPERATING CURRENT</b> : One bank; Active-Precharge; $t_{RC}=t_{RC}(\min)$ ; $t_{CK}=t_{CK}(\min)$ ; DQ,DM and DQS inputs changing once per clock cycle; Address and control inputs changing once every two clock cycles.	IDD0	55	mA
<b>OPERATING CURRENT</b> : One bank; Active-Read-Precharge; BL=4; $t_{RC}=t_{RC}(\min)$ ; $t_{CK}=t_{CK}(\min)$ ; $I_{out}=0mA$ ; Address and control inputs changing once per clock cycle	IDD1	60	mA
<b>PRECHARGE POWER-DOWN STANDBY CURRENT</b> : All banks idle; power-down mode; $t_{CK}=t_{CK}(\min)$ ; CKE=LOW	IDD2P	4	mA
<b>IDLE STANDBY CURRENT</b> : CKE = HIGH; $\overline{CS}$ =HIGH(DESELECT); All banks idle; $t_{CK}=t_{CK}(\min)$ ; Address and control inputs changing once per clock cycle; $V_{IN}=V_{REF}$ for DQ, DQS and DM	IDD2N	30	mA
<b>ACTIVE POWER-DOWN STANDBY CURRENT</b> : one bank active; power-down mode; CKE=LOW; $t_{CK}=t_{CK}(\min)$	IDD3P	17	mA
<b>ACTIVE STANDBY CURRENT</b> : $\overline{CS}$ =HIGH;CKE=HIGH; one bank active ; $t_{RC}=t_{RC}(\max)$ ; $t_{CK}=t_{CK}(\min)$ ;Address and control inputs changing once per clock cycle; DQ,DQS,and DM inputs changing twice per clock cycle	IDD3N	45	mA
<b>OPERATING CURRENT BURST READ</b> : BL=2; READs; Continuous burst; one bank active; Address and control inputs changing once per clock cycle; $t_{CK}=t_{CK}(\min)$ ; $I_{out}=0mA$ ;50% of data changing on every transfer	IDD4R	90	mA
<b>OPERATING CURRENT BURST Write</b> : BL=2; WRITEs; Continuous Burst ;one bank active; address and control inputs changing once per clock cycle; $t_{CK}=t_{CK}(\min)$ ; DQ,DQS,and DM changing twice per clock cycle; 50% of data changing on every transfer	IDD4W	85	mA
<b>AUTO REFRESH CURRENT</b> : $t_{RC}=t_{RFC}(\min)$ ; $t_{CK}=t_{CK}(\min)$	IDD5	65	mA
<b>SELF REFRESH CURRENT</b> : Self Refresh Mode ; CKE $\leq 0.2V$ ; $t_{CK}=t_{CK}(\min)$	IDD6	2	mA
<b>BURST OPERATING CURRENT 4 bank operation</b> : Four bank interleaving READs; BL=4;with Auto Precharge; $t_{RC}=t_{RC}(\min)$ ; $t_{CK}=t_{CK}(\min)$ ; Address and control inputs change only during Active, READ , or WRITE command	IDD7	110	mA

**Table 17. Recommended A.C. Operating Conditions** ( $V_{DD} = 2.5V \pm 0.2V$ ,  $T_A = -40 \sim 85^\circ C$ )

Symbol	Parameter	Min.	Max.	Unit
$V_{IH}$ (AC)	Input High Voltage (AC)	$V_{REF} + 0.31$	-	V
$V_{IL}$ (AC)	Input Low Voltage (AC)	-	$V_{REF} - 0.31$	V
$V_{ID}$ (AC)	Input Different Voltage, CK and $\overline{CK}$ inputs	0.7	$V_{DDQ} + 0.6$	V
$V_{IX}$ (AC)	Input Crossing Point Voltage, CK and $\overline{CK}$ inputs	$0.5 \cdot V_{DDQ} - 0.2$	$0.5 \cdot V_{DDQ} + 0.2$	V

**Note:**

1. Stress greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device.
2. All voltages are referenced to  $V_{SS}$ .
3. These parameters depend on the cycle rate and these values are measured by the cycle rate under the minimum value of  $t_{CK}$  and  $t_{RC}$ . Input signals are changed one time during  $t_{CK}$ .
4. Power-up sequence is described in Note 6.
5. A.C. Test Conditions

**Table 18. SSTL\_2 Interface**

Reference Level of Output Signals ( $V_{REF}$ )	$0.5 \cdot V_{DDQ}$
Output Load	Reference to the Test Load
Input Signal Levels	$V_{REF} + 0.35 V / V_{REF} - 0.35 V$
Input Signals Slew Rate	1 V/ns
Reference Level of Input Signals	$0.5 \cdot V_{DDQ}$

**Figure 4. SSTL\_2 A.C. Test Load**

## 6. Power up Sequence

Power up must be performed in the following sequence.

- 1) Apply power to  $V_{DD}$  before or at the same time as  $V_{DDQ}$ ,  $V_{TT}$  and  $V_{REF}$  when all input signals are held "NOP" state and maintain CKE "LOW".
- 2) Start clock and maintain stable condition for minimum 200 $\mu$ s.
- 3) Issue a "NOP" command and keep CKE "HIGH"
- 4) Issue a "Precharge All" command.
- 5) Issue EMRS – enable DLL.
- 6) Issue MRS – reset DLL. (An additional 200 clock cycles are required to lock the DLL).
- 7) Precharge all banks of the device.
- 8) Issue two or more Auto Refresh commands.
- 9) Issue MRS – with A8 to low to initialize the mode register.

7. For command/address slew rate  $\geq 0.5V/ns$  and  $< 1.0V/ns$ . For CK & CK slew rate  $\geq 1.0V/ns$ .

Figure 28. Precharge Command

BA= Bank Address (if A10 is  
LOW, otherwise don't care)

 Don't Care

The diagram illustrates the timing for entering and exiting power-down mode. It shows four signals over time, with clock cycles labeled T0 through Tn+6.

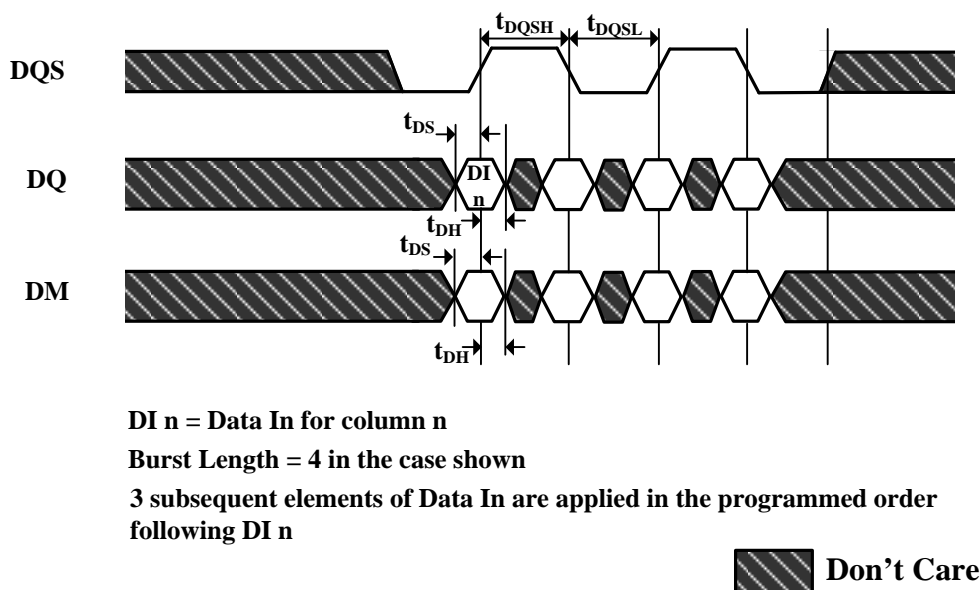

- CK (Clock):** A periodic square wave. A dashed line above it represents the inverted clock ( $\overline{CK}$ ).
- CKE (Clock Enable):** A signal that transitions from high to low at T1 and back to high at Tn+3. The time from the falling edge of CKE to the start of the power-down period is labeled  $t_{IS}$ . Similarly, the time from the rising edge of CKE to the end of the power-down period is labeled  $t_{IS}$ .
- COMMAND:** A sequence of command words represented by hexagons.
  - At T0, a **VALID** command is issued.
  - At T1, the command becomes **Don't Care** (hatched).
  - At T2, a **NOP** (No column access) command is issued, marking the **Enter power-down mode**.
  - From T3 to T4, the command is **Don't Care**.
  - From Tn to Tn+2, the command is **Don't Care**.
  - At Tn+3, a **NOP** command is issued, marking the **Exit power-down mode**.
  - At Tn+5, a **VALID** command is issued.
  - From Tn+6 onwards, the command is **Don't Care**.

A legend at the bottom right shows a hatched hexagon labeled **Don't Care**.

The diagram illustrates the timing sequence for a PLL frequency change. The top signal is the clock  $\overline{CK}$ , with cycles labeled T0, T1, T2, T4, Tx, Tx+1, Ty, Ty+1, Ty+2, Ty+3, Ty+4, and Tz. The middle signal is the command  $CMD$ , which includes NOP, NOP, a series of shaded blocks representing frequency change commands, NOP, DLL RESET, NOP, NOP, and Valid. The bottom signal is the clock enable  $CKE$ , which starts at  $t_{RP}$ , drops to a low level, and then rises back to a high level at  $t_{IS}$ . The diagram indicates that the frequency change occurs during the shaded blocks, and the new clock frequency is stable before power down exit. The minimum time required before changing frequency is 2 clock cycles, and the time between the DLL RESET command and the power down exit is 200 clock cycles.

**Figure 31. Data input (Write) Timing**

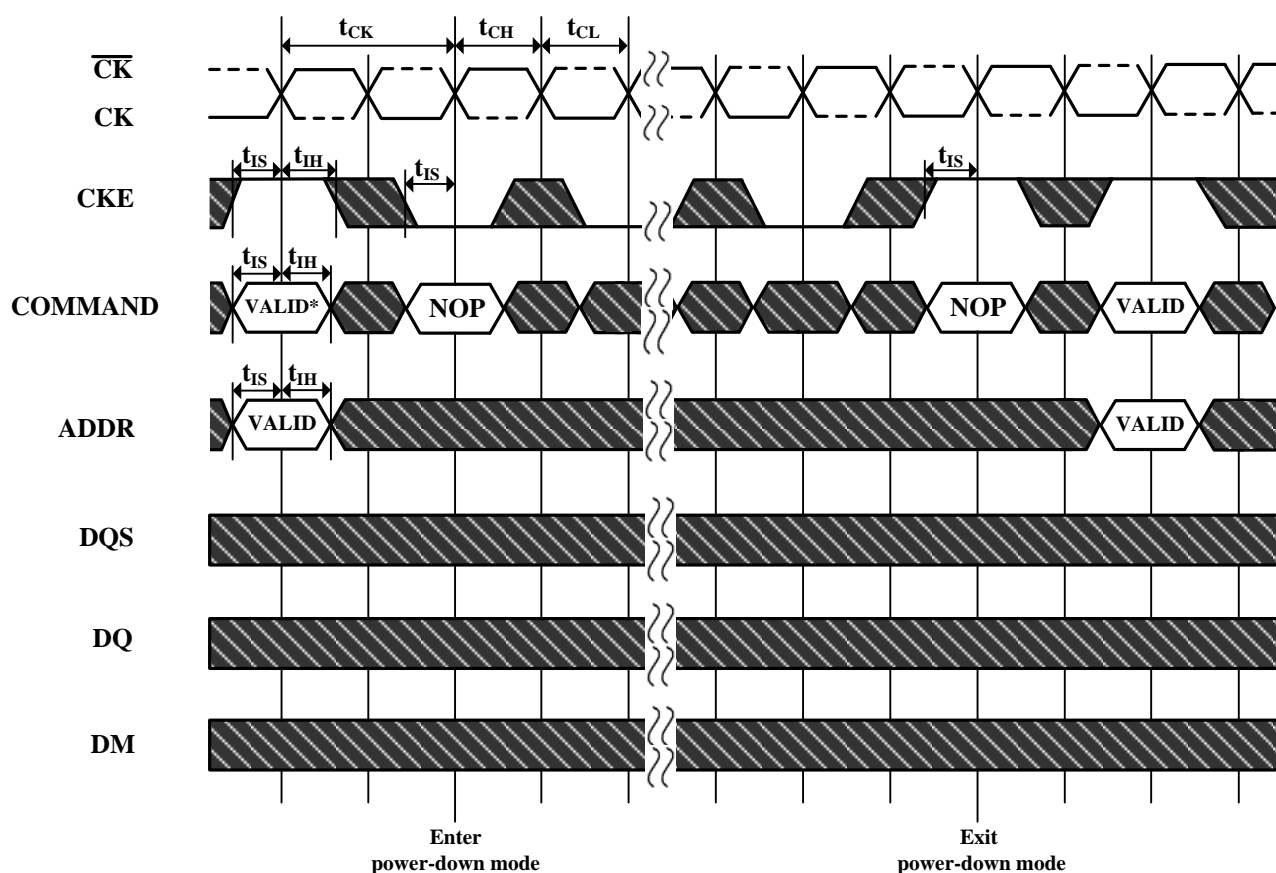

**Figure 32. Data Output (Read) Timing**

\*\* = tMRD is required before any command can be applied, and 200 cycles of CK are required before any executable command can be applied the two auto Refresh commands may be moved to follow the first MRS but precede the second PRECHARGE ALL command.

Rev.1.1 July 2015

Figure 34. Power Down Mode

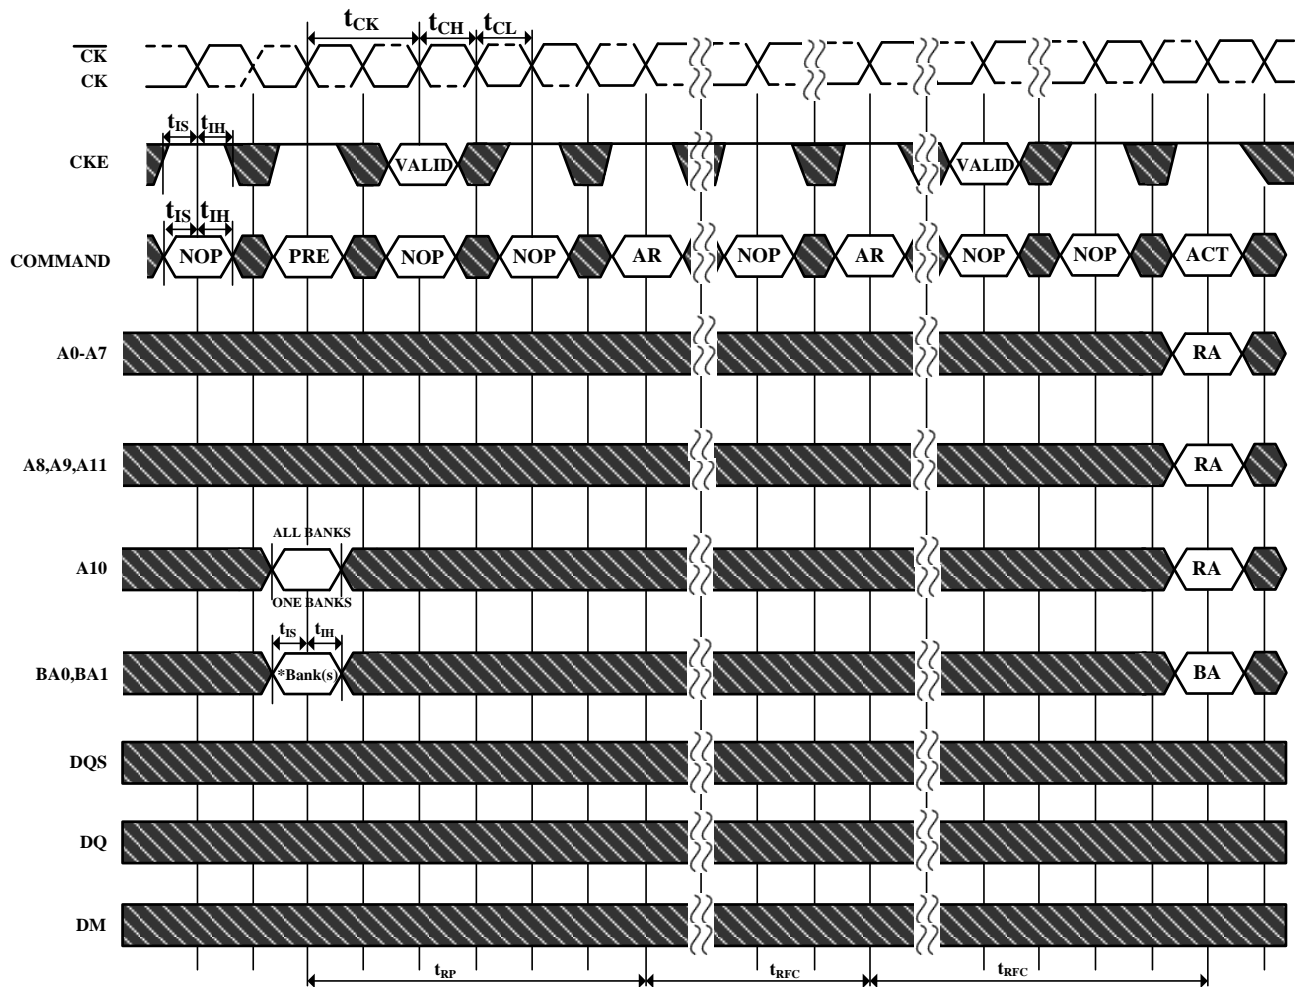

No column accesses are allowed to be in progress at the time Power-Down is entered

\*=If this command is a PRECHARGE ALL (or if the device is already in the idle state) then the Power-Down mode shown is Precharge Power Down. If this command is an ACTIVE (or if at least one row is already active) then the Power-Down mode shown is active Power Down.

 Don't Care

Figure 35. Auto Refresh Mode

\* = "Don't Care", if A10 is HIGH at this point; A10 must be HIGH if more than one bank is active (i.e., must precharge all active banks)

PRE = PRECHARGE, ACT = ACTIVE, RA = Row Address, BA = Bank Address, AR = AUTOREFRESH

NOP commands are shown for ease of illustration; other valid commands may be possible after  $t_{RFC}$

DM, DQ and DQS signals are all "Don't Care" /High-Z for operations shown

 Don't Care

Figure 36. Self Refresh Mode

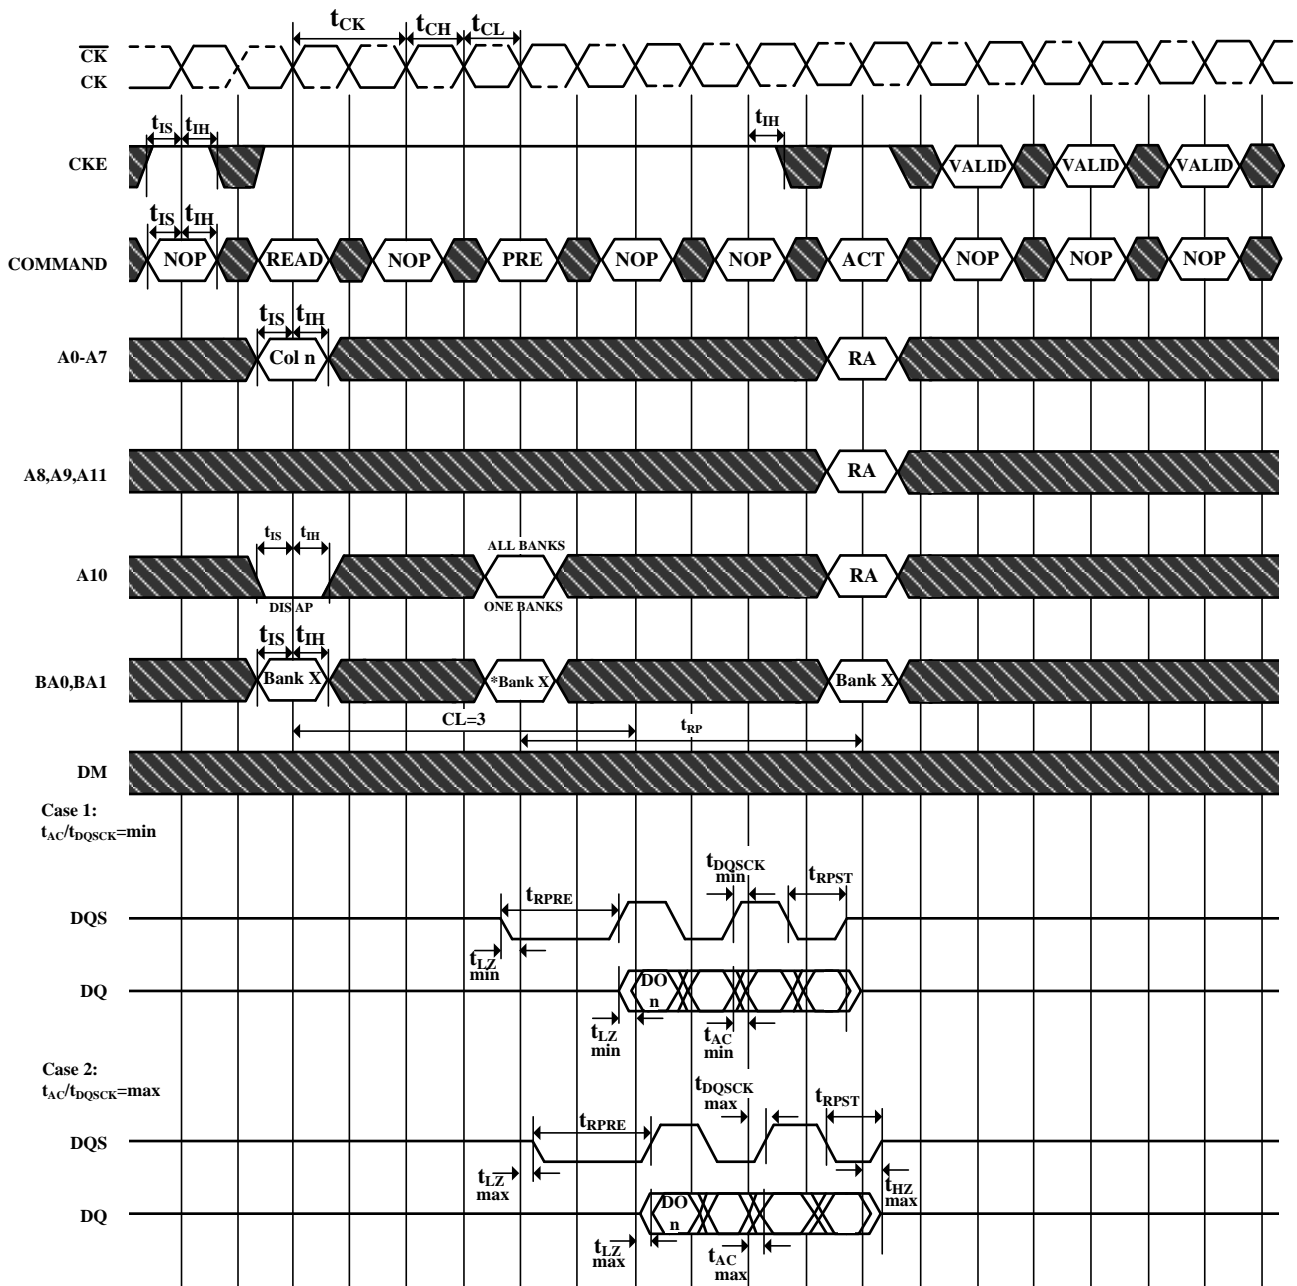

\* = Device must be in the " All banks idle" state prior to entering Self Refresh mode

\*\* =  $t_{XSNR}$  is required before any non-READ command can be applied, and  $t_{XSRD}$  (200 cycles of CK) is required before a READ command can be applied.

 Don't Care

Figure 37. Read without Auto Precharge

DO n = Data Out from column n

Burst Length = 4 in the case shown

3 subsequent elements of Data Out are provided in the programmed order following DO n

DIS AP = Disable Autoprecharge

\* = "Don't Care", if A10 is HIGH at this point

PRE = PRECHARGE, ACT = ACTIVE, RA = Row Address, BA = Bank Address, AR = AUTOREFRESH

NOP commands are shown for ease of illustration; other commands may be valid at these times

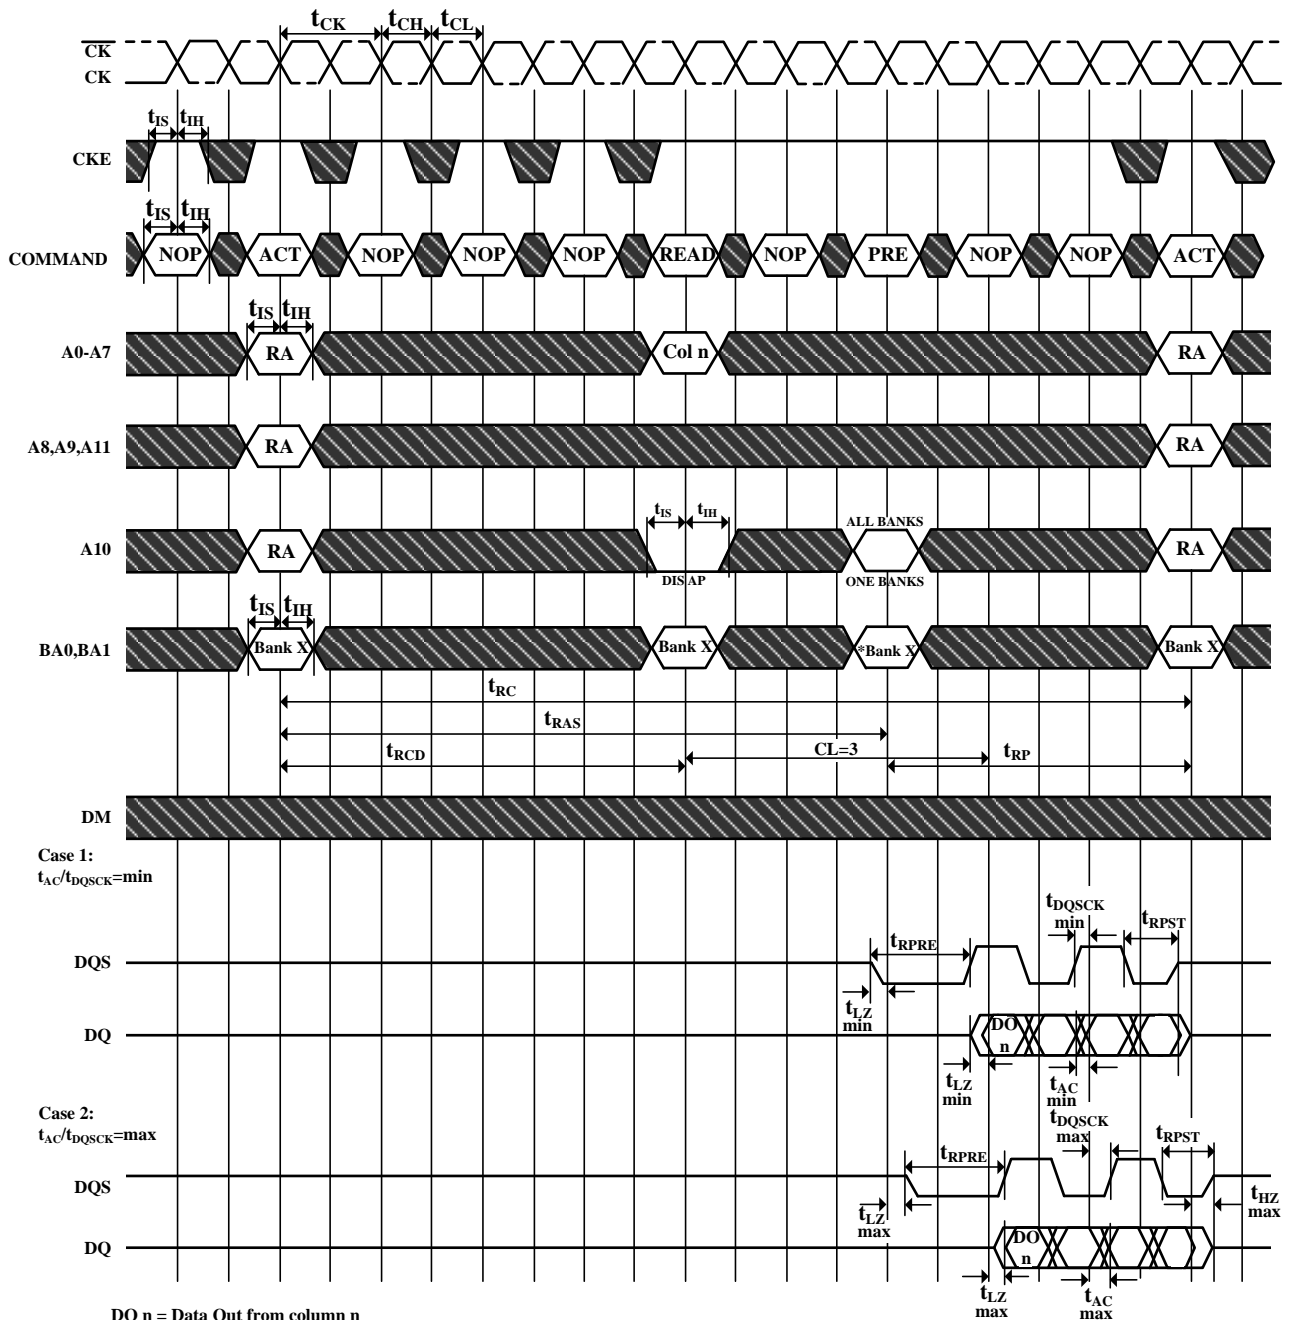

Precharge may not be issued before tRAS ns after the ACTIVE command for applicable banks

 Don't Care

The READ command may not be issued until tRAP has been satisfied. If Fast Autoprecharge is supported, tRAP = tRCD, else the READ may not be issued prior to tRASmin – (BL\*tCK/2)

 Don't Care

Figure 39. Bank Read Access

DO n = Data Out from column n

Burst Length = 4 in the case shown

3 subsequent elements of Data Out are provided in the programmed order following DO n

DIS AP = Disable Autoprecharge

\* = "Don't Care", if A10 is HIGH at this point

PRE = PRECHARGE, ACT = ACTIVE, RA = Row Address, BA = Bank Address

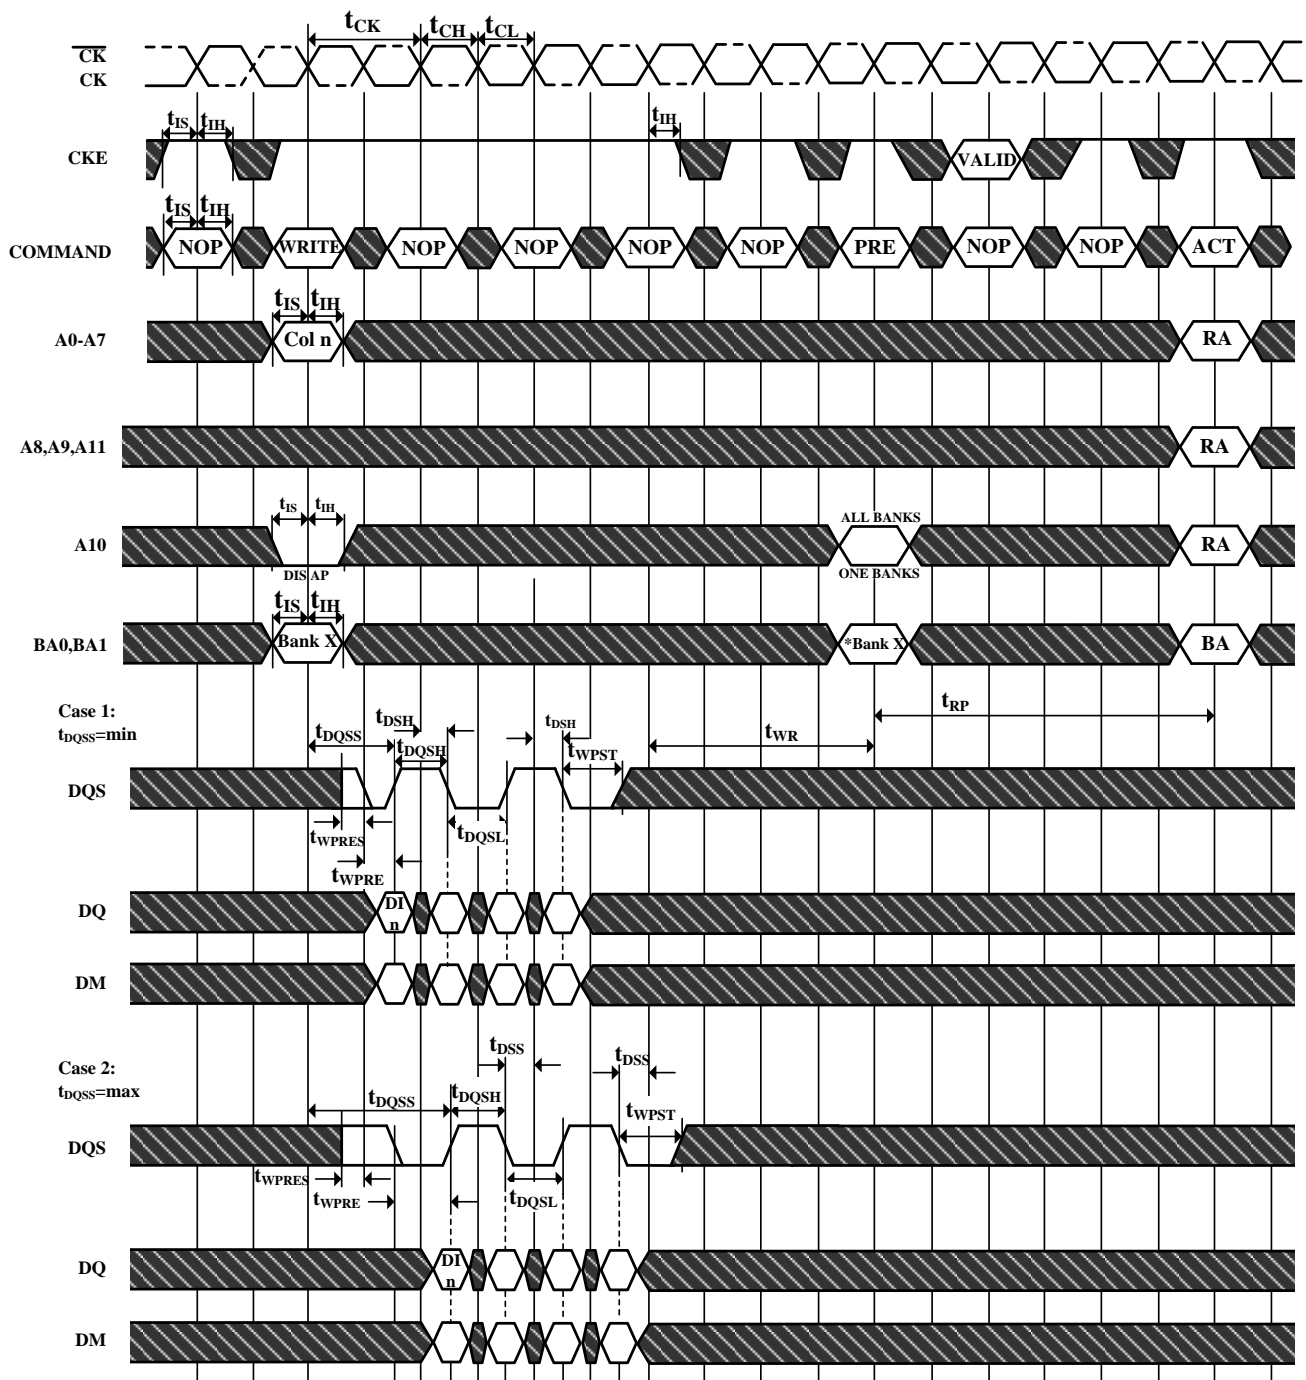

NOP commands are shown for ease of illustration; other commands may be valid at these times

Note that  $t_{RCD} > t_{RCD\ MIN}$  so that the same timing applies if Autoprecharge is enabled (in which case  $t_{RAS}$  would be limiting)

 Don't Care
