

Micropower, Over-The-Top SOT-23, Rail-to-Rail Input and Output Op Amp

FEATURES

- Operates with Inputs Above V^+
- Rail-to-Rail Input and Output
- **Micropower: 55 μ A Supply Current Max**
- Operating Temperature Range: -40°C to 125°C
- Low Profile (1mm) ThinSOT™ Package
- Low Input Offset Voltage: 800 μ V Max
- Single Supply Input Range: 0V to 18V
- High Output Current: 18mA Min
- Specified on 3V, 5V and ± 5 V Supplies
- Output Shutdown on 6-Lead Version
- Reverse Battery Protection to 18V
- High Voltage Gain: 1500V/mV
- Gain Bandwidth Product: 200kHz
- Slew Rate: 0.07V/ μ s

APPLICATIONS

- Portable Instrumentation
- Battery- or Solar-Powered Systems
- Sensor Conditioning
- Supply Current Sensing
- Battery Monitoring
- MUX Amplifiers
- 4mA to 20mA Transmitters

DESCRIPTION

The LT[®]1782 is a 200kHz op amp available in the small SOT-23 package that operates on all single and split supplies with a total voltage of 2.5V to 18V. The amplifier draws less than 55 μ A of quiescent current and has reverse battery protection, drawing negligible current for reverse supply voltages up to 18V.

The input range of the LT1782 includes ground, and a unique feature of this device is its Over-The-Top™ operation capability with either or both of its inputs above the positive rail. The inputs handle 18V both differential and common mode, independent of supply voltage. The input stage incorporates phase reversal protection to prevent false outputs from occurring even when the inputs are 9V below the negative supply.

The LT1782 can drive loads up to 18mA and still maintain rail-to-rail capability. A shutdown feature on the 6-lead version can disable the part, making the output high impedance and reducing quiescent current to 5 μ A. The LT1782 op amp is available in the 5- and 6-lead SOT-23 packages. For applications requiring higher speed, refer to the LT1783.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.
ThinSOT and Over-The-Top are trademarks of Linear Technology Corporation.

TYPICAL APPLICATION

Positive Supply Rail Current Sense

1782 TA01

Distribution of Input Offset Voltage

1782 TA01a

ABSOLUTE MAXIMUM RATINGS (Note 1)

Total Supply Voltage (V^+ to V^-)	18V
Input Differential Voltage	18V
Input Pin Voltage to V^-	+24V/-10V
Shutdown Pin Voltage Above V^-	18V
Shutdown Pin Current	$\pm 10\text{mA}$
Output Short-Circuit Duration (Note 2)	Indefinite
Operating Temperature Range (Note 3)	
LT1782C	-40°C to 85°C
LT1782I	-40°C to 85°C
LT1782H	-40°C to 125°C

Specified Temperature Range (Note 4)	
LT1782C	-40°C to 85°C
LT1782I	-40°C to 85°C
LT1782H	-40°C to 125°C
Junction Temperature	150°C
Storage Temperature Range	-65°C to 150°C
Lead Temperature (Soldering, 10 sec)	300°C

ELECTRICAL CHARACTERISTICS

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: A heat sink may be required to keep the junction temperature below absolute maximum.

Note 3: The LT1782C and LT1782I are guaranteed functional over the operating temperature range of -40°C to 85°C . The LT1782H is guaranteed functional over the operating temperature range of -40°C to 125°C .

Note 4: The LT1782C is guaranteed to meet specified performance from 0°C to 70°C . The LT1782C is designed, characterized and expected to meet specified performance from -40°C to 85°C but is not tested or QA sampled at these temperatures. The LT1782I is guaranteed to meet specified performance from -40°C to 85°C . The LT1782H is guaranteed to meet specified performance from -40°C to 125°C .

Note 5: $V_S = 5\text{V}$ limits are guaranteed by correlation to $V_S = 3\text{V}$ and $V_S = \pm 5\text{V}$ or $V_S = \pm 9\text{V}$ tests.

Note 6: $V_S = 3\text{V}$ limits are guaranteed by correlation to $V_S = 5\text{V}$ and $V_S = \pm 5\text{V}$ or $V_S = \pm 9\text{V}$ tests.

Note 7: Guaranteed by correlation to slew rate at $V_S = \pm 5\text{V}$, and GBW at $V_S = 3\text{V}$ and $V_S = \pm 5\text{V}$ tests.

Note 8: This specification implies a typical input offset voltage of 1.8mV at $V_{\text{CM}} = 18\text{V}$ and a maximum input offset voltage of 7.2mV at $V_{\text{CM}} = 18\text{V}$.

Note 9: This parameter is not 100% tested.

Note 10: Specifications apply to 6-lead SOT-23 with shutdown.

Note 11: Full-power bandwidth is calculated for the slew rate.
 $\text{FPBW} = \text{SR}/2\pi V_P$.

APPLICATIONS INFORMATION

Supply Voltage

The positive supply pin of the LT1782 should be bypassed with a small capacitor (typically $0.1\mu\text{F}$) within an inch of the pin. When driving heavy loads, an additional $4.7\mu\text{F}$ electrolytic capacitor should be used. When using split supplies, the same is true for the negative supply pin.

The LT1782 is protected against reverse battery voltages up to 18V. In the event a reverse battery condition occurs, the supply current is typically less than 1nA.

Inputs

The LT1782 has two input stages, NPN and PNP (see the Simplified Schematic), resulting in three distinct operating regions as shown in the Input Bias Current vs Common Mode typical performance curve.

For input voltages about 0.8V or more below V^+ , the PNP input stage is active and the input bias current is typically -8nA . When the input common mode voltage is within 0.5V of the positive rail, the NPN stage is operating and the input bias current is typically 15nA. Increases in temperature will cause the voltage at which operation switches from the PNP input stage to the NPN input stage to move towards V^+ . The input offset voltage of the NPN stage is untrimmed and is typically 1.8mV.

A Schottky diode in the collector of the input NPN transistors, along with special geometries for these NPN transistors, allows the LT1782 to operate with either or both of its inputs above V^+ . At about 0.3V above V^+ , the NPN input transistor is fully saturated and the input bias current is typically $4\mu\text{A}$ at room temperature. The input offset voltage is typically 1.8mV when operating above V^+ . The LT1782 will operate with its inputs 18V above V^- regardless of V^+ .

The inputs are protected against excursions as much as 10V below V^- by an internal 6k resistor in series with each input and a diode from the input to the negative supply. The input stage of the LT1782 incorporates phase reversal protection to prevent the output from phase reversing for inputs up to 9V below V^- . There are no clamping diodes between the inputs and the maximum differential input voltage is 18V.

Output

The output of the LT1782 can swing to within 60mV of the positive rail with no load and within 3mV of the negative rail with no load. When monitoring voltages within 60mV of the positive rail or within 3mV of the negative rail, gain should be taken to keep the output from clipping. The LT1782 can sink and source over 30mA at $\pm 5\text{V}$ supplies, sourcing current is reduced to 10mA at 3V total supplies as noted in the Electrical Characteristics.

The LT1782 is internally compensated to drive at least 600pF of capacitance under any output loading conditions. A $0.22\mu\text{F}$ capacitor in series with a 150Ω resistor between the output and ground will compensate these amplifiers for larger capacitive loads, up to 10,000pF, at all output currents.

Distortion

There are two main contributors to distortion in op amps: output crossover distortion as the output transitions from sourcing to sinking current, and distortion caused by nonlinear common mode rejection. If the op amp is operating inverting, there is no common mode induced distortion. If the op amp is operating in the PNP input stage (input is not within 0.8V of V^+), the CMRR is very good,

APPLICATIONS INFORMATION

typically 100dB. When the LT1782 switches between input stages, there is significant nonlinearity in the CMRR. Lower load resistance increases the output crossover distortion but has no effect on the input stage transition distortion. For lowest distortion, the LT1782 should be operated single supply, with the output always sourcing current and with the input voltage swing between ground and ($V^+ - 0.8V$). See the Typical Performance Characteristics curves, "Total Harmonic Distortion + Noise vs Output Voltage Amplitude."

Gain

The open-loop gain is almost independent of load when the output is sourcing current. This optimizes perfor-

mance in single supply applications where the load is returned to ground. The typical performance curve of open-loop gain for various loads shows the details.

Shutdown

The 6-lead part includes a shutdown feature that disables the part, reducing quiescent current and making the output high impedance. The part can be shut down by bringing the SHDN pin 1.2V or more above V^- . When shut down, the supply current is about 5 μA and the output leakage current is less than 1 μA ($V^- \leq V_{OUT} \leq V^+$). In normal operation, the SHDN pin can be tied to V^- or left floating. See the Typical Performance Characteristics curves, "Supply Current vs Shutdown Pin Voltage."
