

Future Technology Devices International Ltd. Application Note AN_178 User Guide For LibMPSSE - SPI

Version 1.0

Issue Date: 2011-08-01

This application note is a guide to using the LibMPSSE-SPI – a library which simplifies the design of firmware for interfacing to the FTDI MPSSE configured as an SPI interface. The library is available for Windows and for Linux.

Version 1.0 Clearance No.: FTDI #215

Version 1.0 Clearance No.: FTDI #215

Introduction 1

The Multi Protocol Synchronous Serial Engine (MPSSE) is generic hardware found in several FTDI chips that allows these chips to communicate with a synchronous serial device such an I2C device, an SPI device or a JTAG device. The MPSSE is currently available on the FT2232D, FT2232H, FT4232H and FT232H chips, which communicate with a PC (or an application processor) over the USB interface. Applications on a PC or on an embedded system communicate with the MPSSE in these chips using the D2XX USB drivers.

The MPSSE takes different commands to send out data from the chips in the different formats, namely I2C, SPI and JTAG. libMPSSE is a library that provides a user friendly API that enables users to write applications to communicate with the I2C/SPI/JTAG devices without needing to understand the MPSSE and its commands. However, if the user wishes then he/she may try to understand the working of the MPSSE and use it from their applications directly by calling D2XX functions.

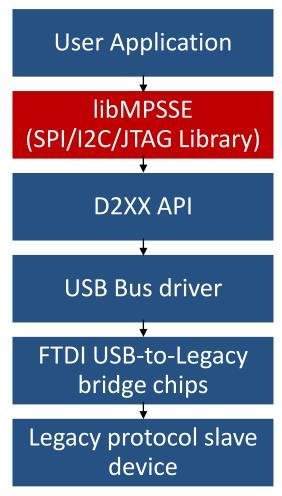

Diagram 1: The software and hardware stack through which legacy protocol data flows

As shown in the the above diagram, libMPSSE has three different APIs, one each for I2C, SPI and JTAG. This document will only describe the SPI section.

Document Reference No.: FT_000491

Version 1.0

2 **System Overview**

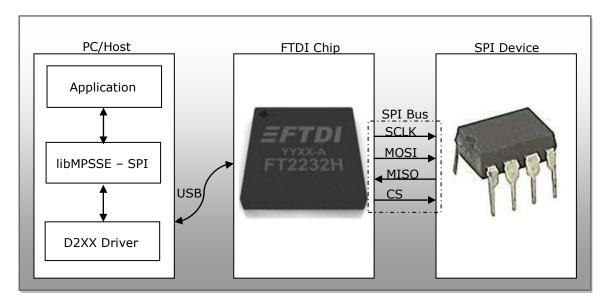

Diagram 2: System organisation

The above diagram shows how the components of the system will typically be organised. The PC/Host may be desktop/laptop machine or an embedded system. The FTDI chip and the SPI device would usually be on the same PCB. Though only one SPI device is shown in the diagram above, up to five SPI devices can actually be connected to each MPSSE.

Version 1.0 Clearance No.: FTDI #215

3 Application Programming Interface (API)

The libMPSSE-SPI APIs can be divided into two broad sets. The first set consists of six control APIs and the second set consists of two data transferring APIs. All the APIs return an FT_STATUS. This is the same FT_STATUS that is defined in the D2XX driver.

3.1 SPI Functions

3.1.1 SPI_GetNumChannels

FT_STATUS **SPI_GetNumChannels** (uint32 *numChannels)

This function gets the number of SPI channels that are connected to the host system. The number of ports available in each of these chips is different.

Parameters:

ou	t	*numChannels	The number of channels connected to the host

Returns:

Returns status code of type FT_STATUS

Note:

FTDI's USB-to-legacy bridge chips may have multiple channels in it but not all these channels can be configured to work as SPI masters. This function returns the total number of channels connected to the host system that has a MPSSE attached to it so that it may be configured as an SPI master.

For example, if an FT2232D (1 MPSSE port), an FT232H (1 MPSSE port), an FT2232H (2 MPSSE ports) and an FT4232H (2 MPSSE ports) are connected to a PC, then a call to SPI_GetNumChannels would return 6 in numChannels.

Warning:

This function should not be called from two applications or from two threads at the same time.

3.1.2 SPI_GetChannelInfo

FT_STATUS SPI_GetChannelInfo (uint32 index,FT_DEVICE_LIST_INFO_NODE *chanInfo)

This function takes a channel index (valid values are from 0 to the value returned by SPI_GetNumChannels - 1) and provides information about the channel in the form of a populated FT_DEVICE_LIST_INFO_NODE structure.

Parameters:

in	index	Index of the channel
out	*chanInfo	Pointer to FT_DEVICE_LIST_INFO_NODE structure

Returns:

Clearance No.: FTDI #215

Returns status code of type FT_STATUS

Note:

This API could be called only after calling SPI_GetNumChannels.

See also:

Structure definition of FT_DEVICE_LIST_INFO_NODE is in the <u>D2XX Programmer's</u> <u>Guide</u>.

Warning:

This function should not be called from two applications or from two threads at the same time.

3.1.3 SPI_OpenChannel

FT_STATUS SPI_OpenChannel (uint32 index, FT_HANDLE *handle)

This function opens the indexed channel and provides a handle to it. Valid values for the index of channel can be from 0 to the value obtained using SPI_GetNumChannels - 1).

Parameters:

in	index	Index of the channel
out	handle	Pointer to the handle of type FT_HANDLE

Returns:

Returns status code of type FT STATUS

Note:

Trying to open an already open channel will return an error code.

3.1.4 SPI_InitChannel

FT_STATUS SPI_InitChannel (FT_HANDLE handle, ChannelConfig *config)

This function initializes the channel and the communication parameters associated with it.

Parameters:

in	handle	Handle of the channel
in	config	Pointer to ChannelConfig structure with the value of clock and latency timer updated
out	none	

Returns:

Returns status code of type FT_STATUS

See also:

Version 1.0 Clearance No.: FTDI #215

Structure definition of ChannelConfig

Note:

This function internally performs what is required to get the channel operational such as resetting and enabling the MPSSE.

3.1.5 SPI_CloseChannel

FT_STATUS SPI_CloseChannel (FT_HANDLE handle)

Closes a channel and frees all resources that were used by it

Parameters:

in	handle	Handle of the channel
out	none	

Returns:

Returns status code of type FT_STATUS

3.1.6 SPI_Read

FT_STATUS SPI_Read(FT_HANDLE handle, uint8 *buffer, uint32 sizeToTransfer, uint32 *sizeTransfered, uint32 transferOptions)

This function reads the specified number of bits or bytes (depending on transferOptions parameter) from an SPI slave.

Parameters:

in	handle	Handle of the channel
out	buffer	Pointer to the buffer where data is to be read
in	sizeToTransfer	Number of bytes or bits to be read
out	*sizeTransfered	Pointer to variable containing the number of bytes or bits read
in	transferOptions	This parameter specifies data transfer options. The bit positions defined for each of these options are:
		BIT0: if set then <i>sizeToTransfer</i> is in bits, otherwise bytes. Bit masks defined for this bit are SPI_TRANSFER_OPTIONS_SIZE_IN_BYTES and SPI_TRANSFER_OPTIONS_SIZE_IN_BITS
		BIT1: if set then the chip select line is asserted before beginning the transfer. Bit mask defined for this bit is SPI_TRANSFER_OPTIONS_CHIPSELECT_ENABLE
		BIT2: if set then the chip select line is disasserted after the transfer ends. Bit mask defined for this bit is SPI_TRANSFER_OPTIONS_CHIPSELECT_DISABLE

Clearance No.: FTDI #215

Version 1.0

BIT3 - BIT31: reserved

Returns:

Returns status code of type FT_STATUS

Warning:

This is a blocking function and will not return until either the specified amount of data are read or an error is encountered.

3.1.7 SPI_Write

FT_STATUS SPI_ Write(FT_HANDLE handle, uint8 *buffer, uint32 sizeToTransfer, uint32 *sizeTransfered, uint32 transferOptions)

This function writes the specified number of bits or bytes (depending on transferOptions parameter) to a SPI slave.

Parameters:

in	handle	Handle of the channel
out	buffer	Pointer to the buffer from where data is to be written
in	sizeToTransfer	Number of bytes or bits to write
out	*sizeTransfered	Pointer to variable containing the number of bytes or bits written
in	transferOptions	This parameter specifies data transfer options. The bit positions defined for each of these options are:
		BIT0: if set then <i>sizeToTransfer</i> is in bits, otherwise bytes. Bit masks defined for this bit are SPI_TRANSFER_OPTIONS_SIZE_IN_BYTES and SPI_TRANSFER_OPTIONS_SIZE_IN_BITS
		BIT1: if set then the chip select line is asserted before beginning the transfer. Bit mask defined for this bit is SPI_TRANSFER_OPTIONS_CHIPSELECT_ENABLE
		BIT2: if set then the chip select line is disasserted after the transfer ends. Bit mask defined for this bit is SPI_TRANSFER_OPTIONS_CHIPSELECT_DISABLE
		BIT3 - BIT31: reserved

Returns:

Returns status code of type FT_STATUS

Warning:

This is a blocking function and will not return until either the specified amount of data is read or an error is encountered.

Returns:

Version 1.0 Clearance No.: FTDI #215

Returns status code of type FT_STATUS

Warning:

This is a blocking function and will not return until either the specified amount of data is read or an error is encountered.

3.1.8 SPI_IsBusy

FT_STATUS SPI_ IsBusy(FT_HANDLE handle, bool *state)

This function reads the state of the MISO line without clocking the SPI bus.

Some applications need the SPI master to poll the MISO line without clocking the bus to check if the SPI slave has completed previous operation and is ready for the next operation. This function is useful for such applications.

Parameters:

in	handle	Handle of the channel
out	* state	Pointer to a variable to which the state of the MISO line will be read

Returns:

Returns status code of type FT_STATUS

3.1.9 SPI_ChangeCS

SPI_ChangeCS(FT_HANDLE handle, uint32 configOptions)

This function changes the chip select line that is to be used to communicate to the SPI slave.

Parameters:

in	handle	Handle of the channel
in	configOptions	This parameter provides a way to select the chip select line and the slave's SPI mode. It is the same parameter as <i>ConfigChannel.configOptions</i> that is passed to function SPI_InitChannel and it is explained in section 3.4.1

Returns:

Returns status code of type FT_STATUS

3.2 GPIO functions

Each MPSSE channel in the FTDI chips are provided with a general purpose I/O port having 8 lines in addition to the port that is used for synchronous serial communication. For example, the FT223H has only one MPSSE channel with two 8-bit busses, ADBUS and ACBUS. Out of these, ADBUS is used for synchronous serial communications (I2C/SPI/JTAG) and ACBUS is free to be used as GPIO. The two functions described below have been provided to access these GPIO lines(also called the higher byte lines of MPSSE) that are available in various FTDI chips with MPSSEs.

Version 1.0 Clearance No.: FTDI #215

3.2.1 FT_WriteGPIO

FT_STATUS FT_WriteGPIO(FT_HANDLE handle, uint8 dir, uint8 value)

This function writes to the 8 GPIO lines associated with the high byte of the MPSSE channel

Parameters:

in	handle	Handle of the channel
in	dir	Each bit of this byte represents the direction of the 8 respective GPIO lines. 0 for in and 1 for out
in	value	If the direction of a GPIO line is set to output, then each bit of this byte represent the output logic state of the 8 respective GPIO lines. 0 for logic low and 1 for logic high

Returns:

Returns status code of type FT_STATUS

3.2.2 FT_ReadGPIO

FT_STATUS FT_ReadGPIO(FT_HANDLE handle,uint8 *value)

This function reads from the 8 GPIO lines associated with the high byte of the MPSSE channel

Parameters:

in	handle	Handle of the channel
out	*value	If the direction of a GPIO line is set to input, then each bit of this byte represent the input logic state of the 8 respective GPIO lines. 0 for logic low and 1 for logic high

Returns:

Returns status code of type FT_STATUS

Note:

The direction of the GPIO line must first be set using FT_WriteGPIO function before this function is used.

3.3 Library Infrastructure Functions

The two functions described in this section typically do not need to be called from the user applications as they are automatically called during entry/exit time. However, these functions are not called automatically when linking the library statically using Microsoft Visual C++. It is then that they need to be called explicitly from the user applications. The static linking sample provided with this manual uses a macro which checks if the code is compiled using Microsoft toolchain, if so then it automatically calls these functions.

Clearance No.: FTDI #215

3.3.1 Init_libMPSSE

void Init_libMPSSE(void)
 Initializes the library

Parameters:

in	none	
out	none	

Returns:

void

3.3.2 Cleanup_libMPSSE

void Cleanup libMPSSE(void)

Cleans up resources used by the library

Parameters:

in	none
out	none

Returns:

void

3.4 Data types

3.4.1 ChannelConfig

ChannelConfig is a structure that holds the parameters used for initializing a channel. The following are members of the structure:

uint32 ClockRate

This parameter takes the value of the clock rate of the SPI bus in hertz. Valid range for ClockRate is 0 to 30MHz.

uint8 LatencyTimer

Required value, in milliseconds, of latency timer. Valid range is 0-255. However, FTDI recommend the following ranges of values for the latency timer:

Range for full speed devices (FT2232D): Range 2 – 255

Range for Hi-speed devices (FT232H, FT2232H, FT4232H): Range 1 - 255

uint32 configOptions

Bits of this member are used in the way described below:

Bit number	Description	Valu e	Meaning of value	Defined macro(if any)
BIT1-	These bits	00	SPI MODE0	SPI_CONFIG_OPTION_MODE0

Version 1.0 Clearance No.: FTDI #215

BIT0	specify to which of the standard SPI modes should the SPI	01	SPI MODE1	SPI_CONFIG_OPTION_MODE1 (Please refer to the release notes within the release package zip file for revision history and known limitations of this version)
	master be configured to	10	SPI MODE2	SPI_CONFIG_OPTION_MODE2
		11	SPI MODE3	SPI_CONFIG_OPTION_MODE3
				(Please refer to the release notes within the release package zip file for revision history and known limitations of this version)
BIT4- BIT2	These bits specify which of the available	000	xDBUS3 of MPSSE is chip select	SPI_CONFIG_OPTION_CS_DBUS3
	lines should be used as chip select	001	xDBUS4 of MPSSE is chip select	SPI_CONFIG_OPTION_CS_DBUS4
		010	xDBUS5 of MPSSE is chip select	SPI_CONFIG_OPTION_CS_DBUS5
		011	xDBUS6 of MPSSE is chip select	SPI_CONFIG_OPTION_CS_DBUS6
		100	xDBUS7 of MPSSE is chip select	SPI_CONFIG_OPTION_CS_DBUS7
BIT5	This bit specifies if the chip select	0	Chip select is active high	
	line should be active low	1	Chip select is active low	SPI_CONFIG_OPTION_CS_ACTIVELOW
BIT6- BIT31	Reserved			

Note: The terms xDBUS0 - xDBUS7 corresponds to lines ADBUS0 - ADBUS7 if the first MPSSE channel is used, otherwise it corresponds to lines BDBUSO - BDBUS7 if the second MPSSE channel(i.e. if available in the chip) is used.

The SPI modes are:

SPI MODEO - data are captured on rising edge and propagated on falling edge

SPI MODE1 - data are captured on falling edge and propagated on rising edge

SPI MODE2 - data are captured on falling edge and propagated on rising edge

SPI MODE3 - data are captured on rising edge and propagated on falling edge

uint32 Pins

This member specifies the directions and values of the lines associated with the lower byte of the MPSSE channel after SPI_InitChannel and SPI_CloseChannel functions are called.

Bit number	Description	Comment
BIT7-BIT0	Direction of the lines after	A 1 corresponds to output
	SPI_InitChannel is called	and a 0 corresponds to input

Version 1.0 Clearance No.: FTDI #215

BIT15-BIT8	Value of the lines after SPI_InitChannel is called	A 1 corresponds to logic high and a 0 corresponds to logic low
BIT23-BIT16	Direction of the lines after SPI_CloseChannel is called	A 1 corresponds to output and a 0 corresponds to input
BIT31-BIT24	Value of the lines after SPI_CloseChannel is called	A 1 corresponds to logic high and a 0 corresponds to logic low

Note that the directions of the SCLK, MOSI and the specified chip select line will be overwritten to 1 and the direction of the MISO like will be overwritten to 0 irrespective of the values passed by the user application.

uint16 reserved

This parameter is reserved and should not be used.

3.4.2 Typedefs

Following are the typedefs that have been defined keeping cross platform portability in view:

- typedef unsigned char uint8
- typedef unsigned short uint16
- typedef unsigned long uint32
- typedef signed char int8
- typedef signed short int16
- typedef signed long int32
- typedef unsigned char bool

Version 1.0 Clearance No.: FTDI #215

Usage example

This example will demonstrate how to connect an MPSSE chip (FT2232H) to an SPI device (93LC56B -EEPROM) and program it using libMPSSE-SPI library.

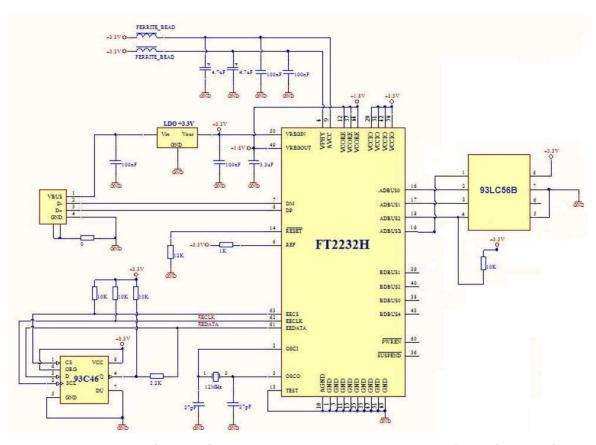

Diagram 3: Schematic for connecting FT2232H to SPI EEPROM device (93LC56B)

The above schematic shows how to connect a FT2232H chip to an SPI EEPROM. Please note that the FT2232H chip is also available as a module which contains all the components shown in the above schematic (except the 93LC56B and the pull-up resistors connected to it). This module is called FT2232H Mini Module and details about it can be found in the device datasheet. The FT2232H chip acts as the SPI master here and is connected to a PC running using USB interface.

The required <u>D2XX driver</u> should be installed into the system depending on the OS that is already installed in the PC/host. If a linux PC is used then the default drivers usbserial and ftdi sio must be removed (using rmmod command).

Once the hardware shown above is connected to a PC and the drivers are installed, we can place the following sample code (sample-static.c), D2XX.h, libMPSSE_spi.h and libMPSSE.a into one folder, compile the sample and run it.

}
```

The sample program shown above writes to address 0 through 15 in the EEPROM chip. The value that is written is address+1, i.e. if the address is 5 then a value 6 is written to that address. When this sample program is compiled and run, we should see an output like the one shown below:
