

## Optocoupler, Phototriac Output, Zero Crossing, High dV/dt, Low Input Current

### DESCRIPTION

The IL410 and IL4108 consists of a GaAs IRLED optically coupled to a photosensitive zero crossing TRIAC network. The TRIAC consists of two inverse parallel connected monolithic SCRs. These three semiconductors are assembled in a six pin dual in-line package.

High input sensitivity is achieved by using an emitter follower phototransistor and a cascaded SCR predriver resulting in an LED trigger current of less than 2 mA (DC).

The use of a proprietary dV/dt clamp results in a static dV/dt of greater than 10 kV/ms. This clamp circuit has a MOSFET that is enhanced when high dV/dt spikes occur between MT1 and MT2 of the TRIAC. When conducting, the FET clamps the base of the phototransistor, disabling the first stage SCR predriver.

The zero cross line voltage detection circuit consists of two enhancement MOSFETS and a photodiode. The inhibit voltage of the network is determined by the enhancement voltage of the N-channel FET. The P-channel FET is enabled by a photocurrent source that permits the FET to conduct the main voltage to gate on the N-channel FET. Once the main voltage can enable the N-channel, it clamps the base of the phototransistor, disabling the first stage SCR predriver.

The 600 V, 800 V blocking voltage permits control of off-line voltages up to 240 V<sub>AC</sub>, with a safety factor of more than two, and is sufficient for as much as 380 V<sub>AC</sub>.

The IL410, IL4108 isolates low-voltage logic from 120 V<sub>AC</sub>, 240 V<sub>AC</sub>, and 380 V<sub>AC</sub> lines to control resistive, inductive, or capacitive loads including motors, solenoids, high current thyristors or TRIAC and relays.

### FEATURES

- High input sensitivity
- $I_{FT} = 2 \text{ mA}$ ,  $PF = 1.0$
- $I_{FT} = 5 \text{ mA}$ ,  $PF \leq 1.0$
- 300 mA on-state current
- Zero voltage crossing detector
- 600 V, 800 V blocking voltage
- High static dV/dt 10 kV/μs
- Very low leakage  $< 10 \mu\text{A}$
- Isolation test voltage 5300 V<sub>RMS</sub>
- Small 6 pin DIP package
- Compliant to RoHS Directive 2002/95/EC and in accordance to WEEE 2002/96/EC

**RoHS**  
COMPLIANT

### APPLICATIONS

- Solid-state relays
- Industrial controls
- Office equipment
- Consumer appliances

### AGENCY APPROVALS

- UL1577, file no. E52744 system code H, double protection
- CSA 93751
- DIN EN 60747-5-2 (VDE 0884)/DIN EN 60747-5-5 (pending), available with option 1

# IL410, IL4108

Vishay Semiconductors Optocoupler, Phototriac Output, Zero Crossing,  
High dV/dt, Low Input Current

## ABSOLUTE MAXIMUM RATINGS ( $T_{amb} = 25 \text{ }^{\circ}\text{C}$ , unless otherwise specified)

PARAMETER	TEST CONDITION	PART	SYMBOL	VALUE	UNIT
<b>INPUT</b>					
Reverse voltage			$V_R$	6	V
Forward current			$I_F$	60	mA
Surge current			$I_{FSM}$	2.5	A
Power dissipation			$P_{diss}$	100	mW
Derate from $25 \text{ }^{\circ}\text{C}$				1.33	$\text{mW}/^{\circ}\text{C}$
<b>OUTPUT</b>					
Peak off-state voltage		IL410	$V_{DRM}$	600	V
		IL4108	$V_{DRM}$	800	V
RMS on-state current			$I_{TM}$	300	mA
Single cycle surge current				3	A
Total power dissipation			$P_{diss}$	500	mW
Derate from $25 \text{ }^{\circ}\text{C}$				6.6	$\text{mW}/^{\circ}\text{C}$
<b>COUPLER</b>					
Isolation test voltage between emitter and detector	$t = 1 \text{ s}$		$V_{ISO}$	5300	$V_{RMS}$
Pollution degree (DIN VDE 0109)				2	
Creepage distance				$\geq 7$	mm
Clearance distance				$\geq 7$	mm
Comparative tracking index per DIN IEC112/VDE 0303 part 1, group IIIa per DIN VDE 6110			CTI	$\geq 175$	
Isolation resistance	$V_{IO} = 500 \text{ V}, T_{amb} = 25 \text{ }^{\circ}\text{C}$		$R_{IO}$	$\geq 10^{12}$	$\Omega$
	$V_{IO} = 500 \text{ V}, T_{amb} = 100 \text{ }^{\circ}\text{C}$		$R_{IO}$	$\geq 10^{11}$	$\Omega$
Storage temperature range			$T_{stg}$	- 55 to + 150	$^{\circ}\text{C}$
Ambient temperature			$T_{amb}$	- 55 to + 100	$^{\circ}\text{C}$
Soldering temperature <sup>(1)</sup>	max. $\leq 10 \text{ s}$ dip soldering $\geq 0.5 \text{ mm}$ from case bottom		$T_{sld}$	260	$^{\circ}\text{C}$

### Notes

- Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operational sections of this document. Exposure to absolute maximum ratings for extended periods of the time can adversely affect reliability.
- <sup>(1)</sup> Refer to reflow profile for soldering conditions for surface mounted devices (SMD). Refer to wave profile for soldering conditions for through hole devices (DIP).

ELECTRICAL CHARACTERISTICS ( $T_{amb} = 25^\circ C$ , unless otherwise specified)							
PARAMETER	TEST CONDITION	PART	SYMBOL	MIN.	TYP.	MAX.	UNIT
<b>INPUT</b>

## TRIGGER CURRENT VS. TEMPERATURE AND VOLTAGE

The trigger current of the IL410, 4108 has a positive temperature gradient and also is dependent on the terminal voltage as shown as the fig. 11.

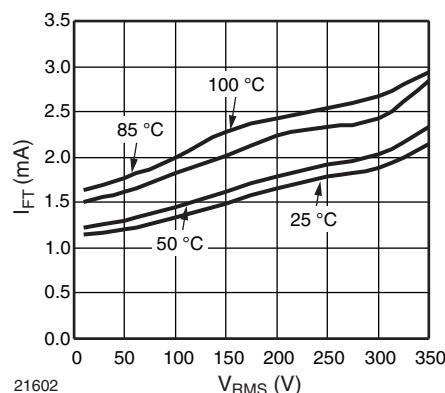

Fig. 11 - Trigger Current vs.  
Temperature and Operating Voltage (50 Hz)

For the operating voltage 250 V<sub>RMS</sub> over the temperature range - 40 °C to 85 °C, the I<sub>F</sub> should be at least 2.3 x of the I<sub>FT1</sub> (2 mA, max.).

Considering - 30 % degradation over time, the trigger current minimum is I<sub>F</sub> = 2 x 2.3 x 130 % = 6 mA

**INDUCTIVE AND RESISTIVE LOADS**

For inductive loads, there is phase shift between voltage and current, shown in the fig. 12.

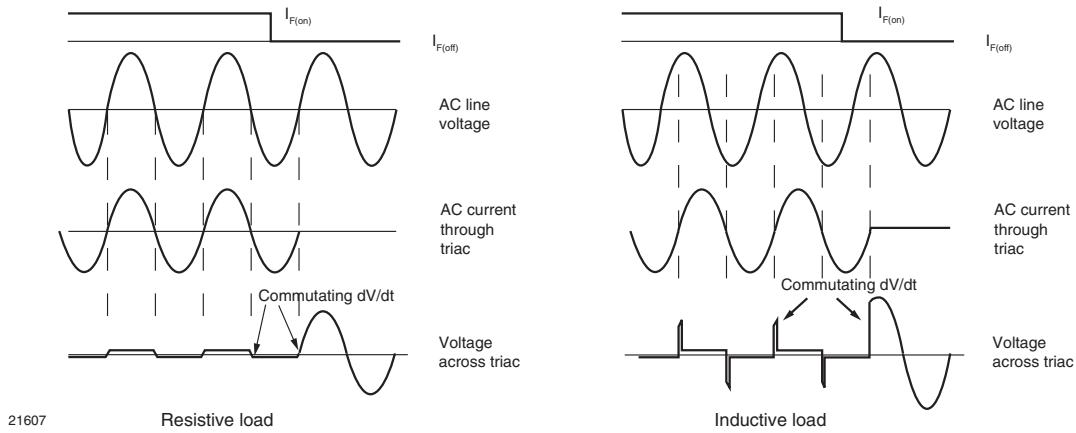

Fig. 12 - Waveforms of Resistive and Inductive Loads

The voltage across the triac will rise rapidly at the time the current through the power handling triac falls below the holding current and the triac ceases to conduct. The rise rate of voltage at the current commutation is called commutating dV/dt. There would be two potential problems for ZC phototriac control if the commutating dV/dt is too high. One is lost control to turn off, another is failed to keep the triac on.

**Lost control to turn off**

If the commutating dV/dt is too high, more than its critical rate ( $dV/dt_{crd}$ ), the triac may resume conduction even if the LED drive current  $I_F$  is off and control is lost.

In order to achieve control with certain inductive loads of power factors is less than 0.8, the rate of rise in voltage ( $dV/dt$ ) must be limited by a series RC network placed in parallel with the power handling triac. The RC network is called snubber circuit. Note that the value of the capacitor increases as a function of the load current as shown in fig. 13.

**Failed to keep on**

As a zero-crossing phototriac, the commutating dV/dt spikes can inhibit one half of the TRIAC from keeping on. If the spike potential exceeds the inhibit voltage of the zero cross detection circuit, even if the LED drive current  $I_F$  is on.

This hold-off condition can be eliminated by using a snubber and also by providing a higher level of LED drive current. The higher LED drive provides a larger photocurrent which causes the triac to turn-on before the commutating spike has activated the zero cross detection circuit. Fig. 14 shows the relationship of the LED current for power factors of less than 1.0. The curve shows that if a device requires 1.5 mA for a resistive load, then 1.8 times (2.7 mA) that amount would be required to control an inductive load whose power factor is less than 0.3 without the snubber to dump the spike.

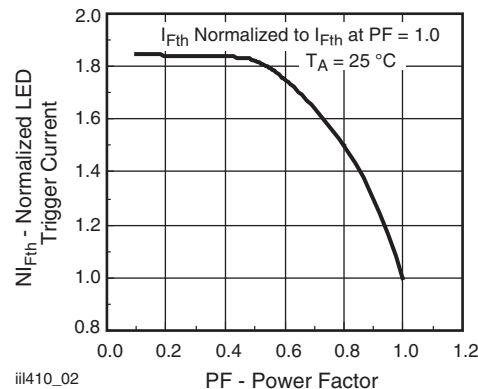

Fig. 14 - Normalized LED Trigger Current vs. Power Factor

## Optocoupler, Phototriac Output, Zero Crossing, Vishay Semiconductors High dV/dt, Low Input Current

### APPLICATIONS

Direct switching operation:

The IL410, IL4108 isolated switch is mainly suited to control synchronous motors, valves, relays and solenoids. Fig. 15 shows a basic driving circuit. For resistive load the snubber circuit  $R_s$   $C_s$  can be omitted due to the high static dV/dt characteristic.

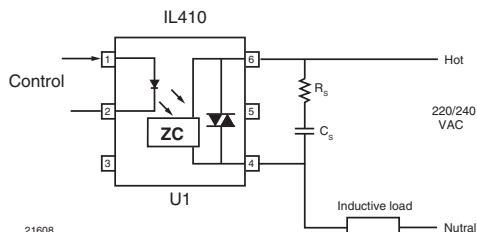

Fig. 15 - Basic Direct Load Driving Circuit

Indirect switching operation:

The IL410, IL4108 switch acts here as an isolated driver and thus enables the driving of power thyristors and power triacs by microprocessors. Fig. 16 shows a basic driving circuit of inductive load. The resistor  $R_1$  limits the driving current pulse which should not exceed the maximum permissible surge current of the IL410, IL4108. The resistor  $R_G$  is needed only for very sensitive thyristors or triacs from being triggered by noise or the inhibit current.
