

CDMA IF VGAs and I/Q Demodulators with VCO and Synthesizer

General Description

The MAX2306/MAX2308/MAX2309 are IF receivers designed for dual-band, dual-mode, and single-mode N-CDMA and W-CDMA cellular phone systems. The signal path consists of a variable-gain amplifier (VGA) and I/Q demodulator. The devices feature guaranteed +2.7V operation, a gain control range of over 110dB, and high input IP3 (-31dBm at 35dB gain, 3.4dBm at -35dB gain).

Unlike similar devices, the MAX2306 family of receivers includes dual oscillators and synthesizers to form a self-contained IF subsystem. The synthesizer's reference and RF dividers are fully programmable through a 3-wire serial bus, enabling dual-band system architectures using any common reference and IF frequency. The differential baseband outputs have enough bandwidth to suit both N-CDMA and W-CDMA systems, and offer saturated output levels of 2.7Vp-p at a low +2.75V supply voltage. Including the low-noise voltage-controlled oscillator (VCO) and synthesizer, the MAX2306 draws only 26mA from a +2.75V supply in CDMA (differential IF) mode.

The MAX2306/MAX2308/MAX2309 are available in 28-pin Thin QFN and QFN packages.

Applications

Single/Dual/Triple-Mode CDMA Handsets
Globalstar Dual-Mode Handsets
Wireless Data Links
W-CDMA Handsets
Wireless Local Loop (WLL)

Features

- ◆ Complete IF Subsystem Includes VCO and Synthesizer
- ◆ Supports Dual-Band, Triple-Mode Operation
- ◆ VGA with >110dB Gain Control
- ◆ Quadrature Demodulator
- ◆ High Output Level (2.7V)
- ◆ Programmable Charge-Pump Current
- ◆ Supports Any IF Frequency Between 40MHz and 300MHz
- ◆ 3-Wire Programmable Interface
- ◆ Low Supply Voltage (+2.7V)

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX2306 EGI	-40°C to +85°C	28 QFN-EP*
MAX2306ETI	-40°C to +85°C	28 TQFN-EP*
MAX2308 EGI	-40°C to +85°C	28 QFN-EP*
MAX2308ETI	-40°C to +85°C	28 TQFN-EP*
MAX2309 EGI	-40°C to +85°C	28 QFN-EP*
MAX2309ETI	-40°C to +85°C	28 TQFN-EP*

*Exposed paddle

Pin Configurations appear at end of data sheet.

Block Diagram appears at end of data sheet.

Selector Guide

PART	MODE	DESCRIPTION	INPUT RANGE
MAX2306	AMPS, Cellular CDMA, PCS CDMA	Dual Band, Triple Mode with Two IF VCOs	40MHz to 300MHz
MAX2308	AMPS, Cellular CDMA, PCS CDMA	Dual Band, Triple Mode with Common IF VCO	70MHz to 300MHz
MAX2309	External AMPS, Cellular CDMA, PCS CDMA	Dual Band, Triple Mode (Drives External AMPS Discriminator)	70MHz to 300MHz

CDMA IF VGAs and I/Q Demodulators with VCO and Synthesizer

ABSOLUTE MAXIMUM RATINGS

V_{CC} to GND -0.3V to +6.0V
 $\overline{\text{SHDN}}$ to GND -0.3V to (V_{CC} + 0.3V)
 $\overline{\text{STBY}}$, BUFEN, MODE, $\overline{\text{EN}}$, DATA,
 CLK, DIVSEL -0.3V to (V_{CC} + 0.3V)
 VGC to GND -0.3V, the lesser of +4.2V or (V_{CC} + 0.3V)
 AC Signals TANKH \pm , TANKL \pm ,
 REF, FM \pm , CDMA \pm 1.0V peak

Digital Input Current $\overline{\text{SHDN}}$, MODE, DIVSEL,
 BUFEN, DATA, CLK, $\overline{\text{EN}}$, $\overline{\text{STBY}}$ $\pm 10\text{mA}$
 Continuous Power Dissipation (T_A = +70°C)
 28-Pin QFN (derate 28.5mW/°C above T_A = +70°C) 2W
 Operating Temperature Range -40°C to +85°C
 Junction Temperature +150°C
 Storage Temperature Range -65°C to +160°C
 Lead Temperature (soldering, 10s) +300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Detailed Description

MAX2306

The MAX2306 is intended for dual-band (PCS and cellular) and dual-mode code division multiple access (CDMA) and FM applications (Figure 1). The device includes an IF variable-gain amplifier, quadrature demodulator, dual VCOs, and dual-frequency synthesizers (*Functional Diagram*). Dual VCOs are provided for applications using different IF frequencies for each mode or band of operation. The analog FM output signal can be configured for conversion to the I channel, or it may be converted in quadrature to both the I and Q channels. The MAX2306's operation modes are described in Table 1. These modes are set by programming the control register and setting logic levels on control pins. If MODE is left floating, the internal register controls the operation. If driven high or low, mode will override certain register bits, as shown in Table 1.

MAX2308

The MAX2308 supports dual-band, triple mode with common IF VCO. As with the MAX2306, the FM mode can be configured for conversion to the I port or quadrature conversion to both the I and Q ports (Figure 2). The MAX2308's operational modes are described in Table 2. These modes are set by programming the control register.

MAX2309

The MAX2309 quadrature demodulators are simplified versions of the MAX2306 that can be used in single-mode CDMA or triple mode using an external FM discriminator (Figure 3). The MAX2309 VCO is optimized for the 67MHz to 300MHz IF frequency range.

The MAX2309 includes a buffered output for the VCO. The buffered VCO output can be used to support sys-

tems implementing traditional limiting IF stages for FM demodulation in dual-mode phones as well as for the transmit LO in TDD systems. This buffered output can be configured for the VCO frequency (twice the IF frequency) or one-half the VCO frequency (IF frequency). The BUFEN pin enables this feature. A standby mode, in which only the VCO and synthesizer are operational, can be selected through the serial interface or the STBY pin. The MAX2309's operational modes are described in Table 3. These modes are set by programming the control register and/or setting logic levels on control pins. If the control pins (STBY, BUFEN, DIVSEL) are left floating, the internal register controls the operational mode. If driven high or low, the control pins will override certain register bits, as shown in Table 3.

Applications Information

Variable-Gain Amplifier and Demodulator

The MAX2306 family provides a VGA with exceptional gain range. The MAX2306/MAX2308 support multimode applications with dual differential inputs, selectable with the IN_SEL (IS) control bit. On the MAX2306, this function can be controlled with the MODE pin, which overrides the IS control bit. The VGA's gain is controlled over a 110dB range with the VGC pin. The output of the VGA drives the RF ports of a quadrature demodulator. The MAX2306/MAX2308 provide two types of FM demodulation, controlled by the FM_TYPE (FT) control bit. When FM_TYPE is "1," the signal is passed through both the I and Q signal paths for subsequent lowpass filtering and A/D conversion at baseband. If FM_TYPE is "0," the FM signal is passed through the I mixer only.

CDMA IF VGAs and I/Q Demodulators with VCO and Synthesizer

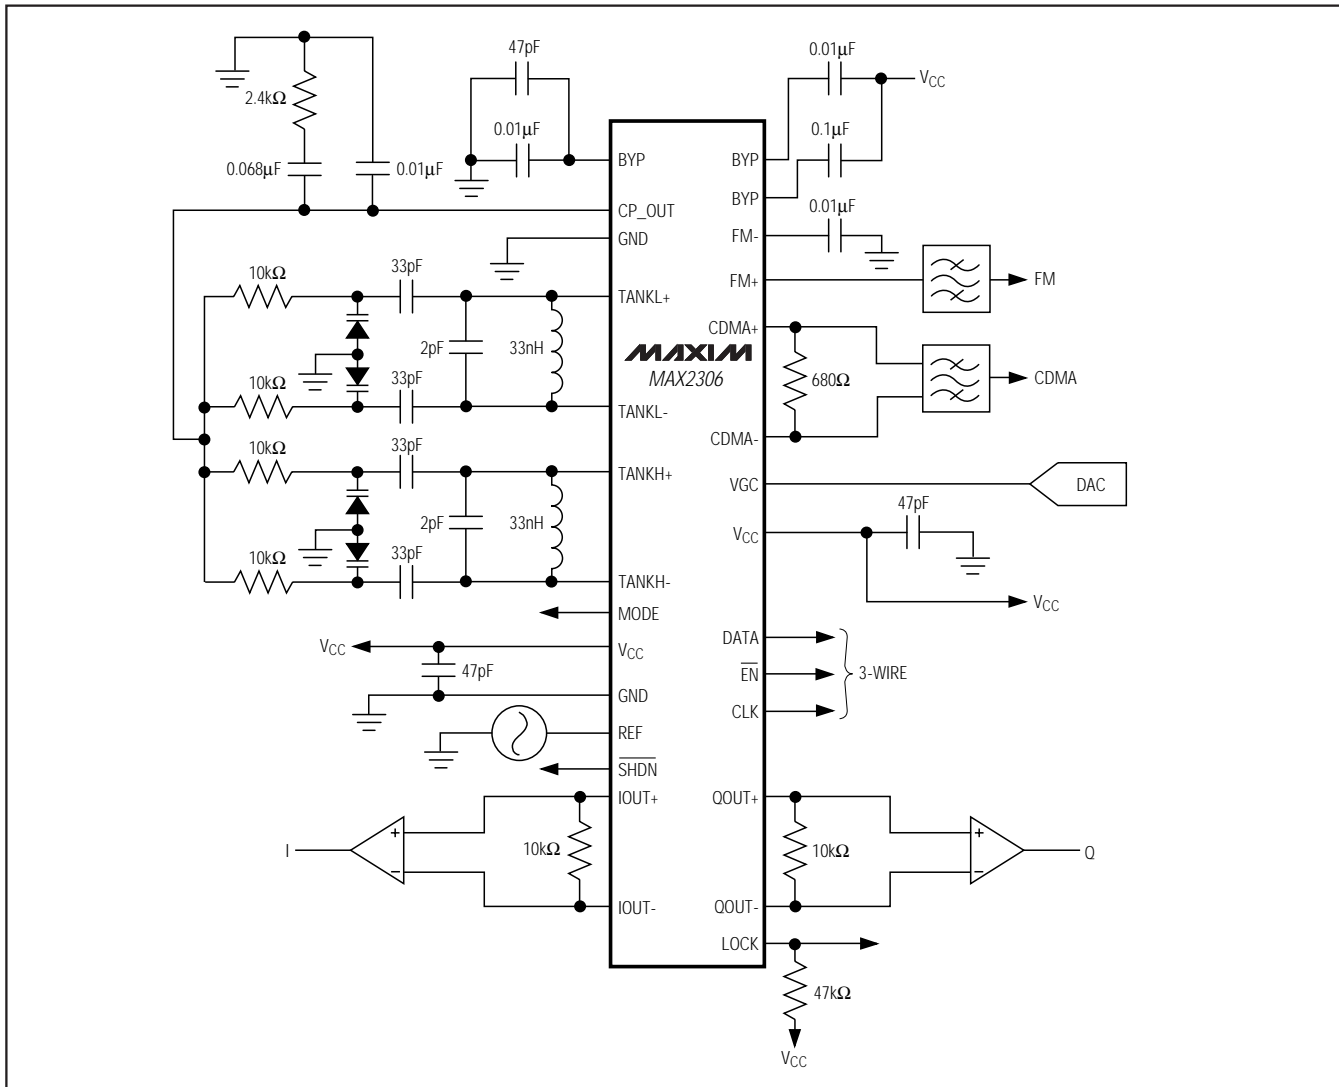

Figure 1. MAX2306 Typical Operating Circuit

Voltage-Controlled Oscillator, Buffers, and Quadrature Generation

The LO signal for downconversion is provided by a voltage-controlled oscillator (VCO) consisting of an on-chip differential oscillator, and an off-chip high-Q resonant network. Figure 4 shows a simplified schematic of the VCO oscillator. Multiband operation is supported by the MAX2306 with dual VCOs. VCO_H and VCO_L are selectable with the MODE pin or the VCO_SEL (VS) control bit. They oscillate at twice the desired LO frequency. For applications requiring an external LO, the VCOs can be bypassed with the VCO_BYP (VB) control bit.

The MAX2309 buffers the output of the VCO and provides this signal at the LOOUT pin. This signal is enabled by the $\overline{\text{BUFEN}}$ (BE) control bit or by the $\overline{\text{BUFEN}}$ control pin. The frequency of this signal is selected by the BUF_DIV (BD) control bit, and can be either the VCO frequency or half the VCO frequency.

Quadrature downconversion is realized by providing in-phase (I) and quadrature-phase (Q) components of the LO signal to the LO ports of the demodulator described above. The quadrature LO signals are generated by dividing the VCO output frequency using two latches.

CDMA IF VGAs and I/Q Demodulators with VCO and Synthesizer

Table 1. MAX2306 Control Register States

OPERATIONAL MODE	ACTION RESULT	PINS		CONTROL REGISTER												L S B
		SHDN	MODE	TEST_MODE	CP POL	TEST_EN	TURBOCHARGE	DIVSEL	VCO_BYP	VCO_SEL	BUF_DIV	BUFEN	FM_TYPE	IN_SEL	STBY	SHDN
SHUTDOWN	Shutdown pin completely powers down the chip	L	X	X	X	X	X	X	X	X	X	X	X	X	X	X
SHUTDOWN	0 in shutdown register bit leaves serial port active	H	X	X	X	X	X	X	X	X	X	X	X	X	X	0
STANDBY	0 in standby register bit turns off VGA and modulator only	H	X	X	X	0					X	X			0	1
CDMA	Mode pin overrides VCO_SEL, DIVSEL, and IN_SEL to high	H	H			0		X		X	X	X	X	X	1	1
CDMA	Floating mode pin returns control to register	H	F			0		1		1	X	X	X	1	1	1
FM_IQ	Mode pin overrides VCO_SEL, DIVSEL, and IN_SEL to low	H	L			0		X		X	X	X	0	X	1	1
FM_IQ	Floating mode pin returns control to register	H	F			0					X	X	0	0	1	1
FM_I	Mode pin overrides VCO_SEL, DIVSEL, and IN_SEL to low	H	L			0		X		X	X	X	1	X	1	1
FM_I	Floating pins return control to register	H L	F			0					X	X	1	0	1	1

Note: H = high, L = low, F = floating pin, X = don't care, Blank = independent parameter, 1 = logic high, 0 = logic low.

The appropriate latch outputs provide I and Q signals at the desired LO frequency.

Synthesizer

The VCO's output frequency is controlled by an internal phase-locked-loop (PLL) dual-modulus synthesizer. The loop filter is off-chip to simplify loop design for emerging applications. The tunable resonant network is also off-chip for maximum Q and for system design flexibility. The VCO output frequency is divided down to the desired comparison frequency with the M counter. The M counter consists of a 4-bit A swallow counter and a 10-bit P counter. A reference signal is provided from an external source and is divided down to the comparison frequency with the R counter. The two divided signals are compared with a three-state digital phase-fre-

quency detector. The phase-detector output drives a charge-pump as well as lock-detect logic and turbocharge control logic. The charge-pump output (CP_OUT) pin is processed by the loop filter and drives the tunable resonant network, altering the VCO frequency and closing the loop.

Multimode applications are supported by two independent programmable registers each for the M counter (M1, M2), the R counter (R1, R2), and the charge-pump output current magnitude (CP1, CP2). The DIVSEL (DS) bit selects which set of registers is used. It can be overridden by the MAX2306's MODE pin or the MAX2309's DIVSEL pin. Programming these registers is discussed in the *3-Wire Interface and Registers* section.

CDMA IF VGAs and I/Q Demodulators with VCO and Synthesizer

Table 2. MAX2308 Control Register States

OPERATIONAL MODE	ACTION RESULT	PIN	CONTROL REGISTER												LSB
		SHDN	TEST_MODE	CP_POL	TEST_EN	TURBOCHARGE	DIVSEL	VCO_BYP	VCO_SEL	BUF_DIV	BUFEN	FM_TYPE	IN_SEL	STBY	SHDN
SHUTDOWN	Shutdown pin completely shuts down chip	L	X	X	X	X	X	X	X	X	X	X	X	X	X
SHUTDOWN	0 in shutdown register bit leaves serial port active	H	X	X	X	X	X	X	X	X	X	X	X	X	L
STANDBY	0 in standby pin turns off VGA and modulator only	H			0				0	X	X			0	1
CDMA	CDMA operation	H			0				0	X	X	X	1	1	1
FM_IQ	FM IQ quadrature operation	H			0				0	X	X	0	0	1	1
FM_I	FM I operation	H			0				0	X	X	1	0	1	1

Note: H = high, L = low, 1 = logic high, 0 = logic low, X = don't care, blank = independent parameter

When the part initially powers up or changes state, the synthesizer acquisition time can be reduced by using the Turbo feature, enabled by the TURBOCHARGE (TC) control bit. Turbo functionality provides a larger charge-pump current during acquisition mode. Once the VCO frequency is acquired, the charge-pump output current magnitude automatically returns to the pre-programmed state to maintain loop stability and minimize spurs in the VCO output signal.

The lock detect output indicates when the PLL is locked with a logic high.

3-Wire Interface and Registers

The MAX2306 family incorporates a 3-wire interface for synthesizer programming and device configuration (Figure 5). The 3-wire interface consists of clock, data, and enable signals. It controls the VCO dividers (M1 and M2), reference frequency dividers (R1 and R2), and a 13-bit control register. The control register is used to set up the operational modes (Table 4). The input shift is 17 data bits long and requires a total of 18 clock bits (Figure 6). A single clock pulse is required before enable drops low to initialize the data bus.

Whenever the M or R divide register value is programmed and downloaded, the control register must also be subsequently updated. This prevents turbolock from going active when not desired.

The $\overline{\text{SHDN}}$ control bit is notable because it differs from the SHDN pin. When the $\overline{\text{SHDN}}$ control bit is low, the registers and serial interface are left active, retaining the values stored in the latches, while the rest of the device is shut off. In contrast, the $\overline{\text{SHDN}}$ pin, when low, shuts down everything, including the registers and serial interface. See *Functional Diagram*.

Registers

Figure 7 shows the programming logic. The 17-bit shift register is programmed by clocking in data at the rising edge of CLK. Before the shift register is able to accept data, it must be initialized by driving it with at least one full clock cycle at the CLK input with $\overline{\text{EN}}$ high (see Figure 6). Pulling enable low will allow data to be clocked into the shift register; pulling enable high loads the register addressed by A0, A1, and A2, respectively (Figure 7). Table 5 lists the power-on default values of all registers. Table 6 lists the charge-pump current, depending on CP0 and CP1.

CDMA IF VGAs and I/Q Demodulators with VCO and Synthesizer

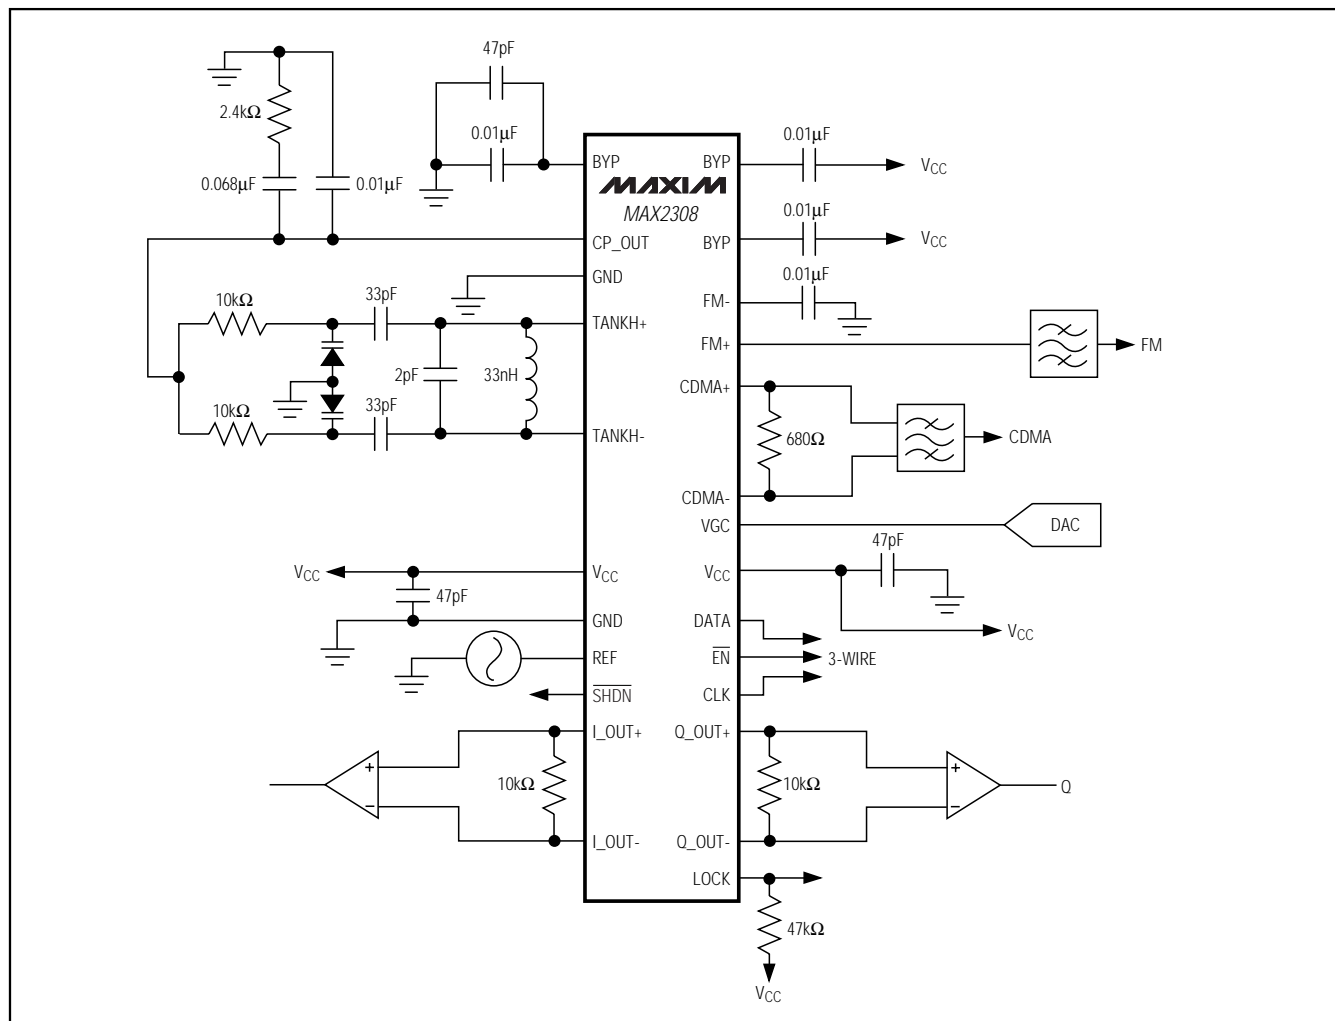

Figure 2. MAX2308 Typical Operating Circuit

CDMA IF VGAs and I/Q Demodulators with VCO and Synthesizer

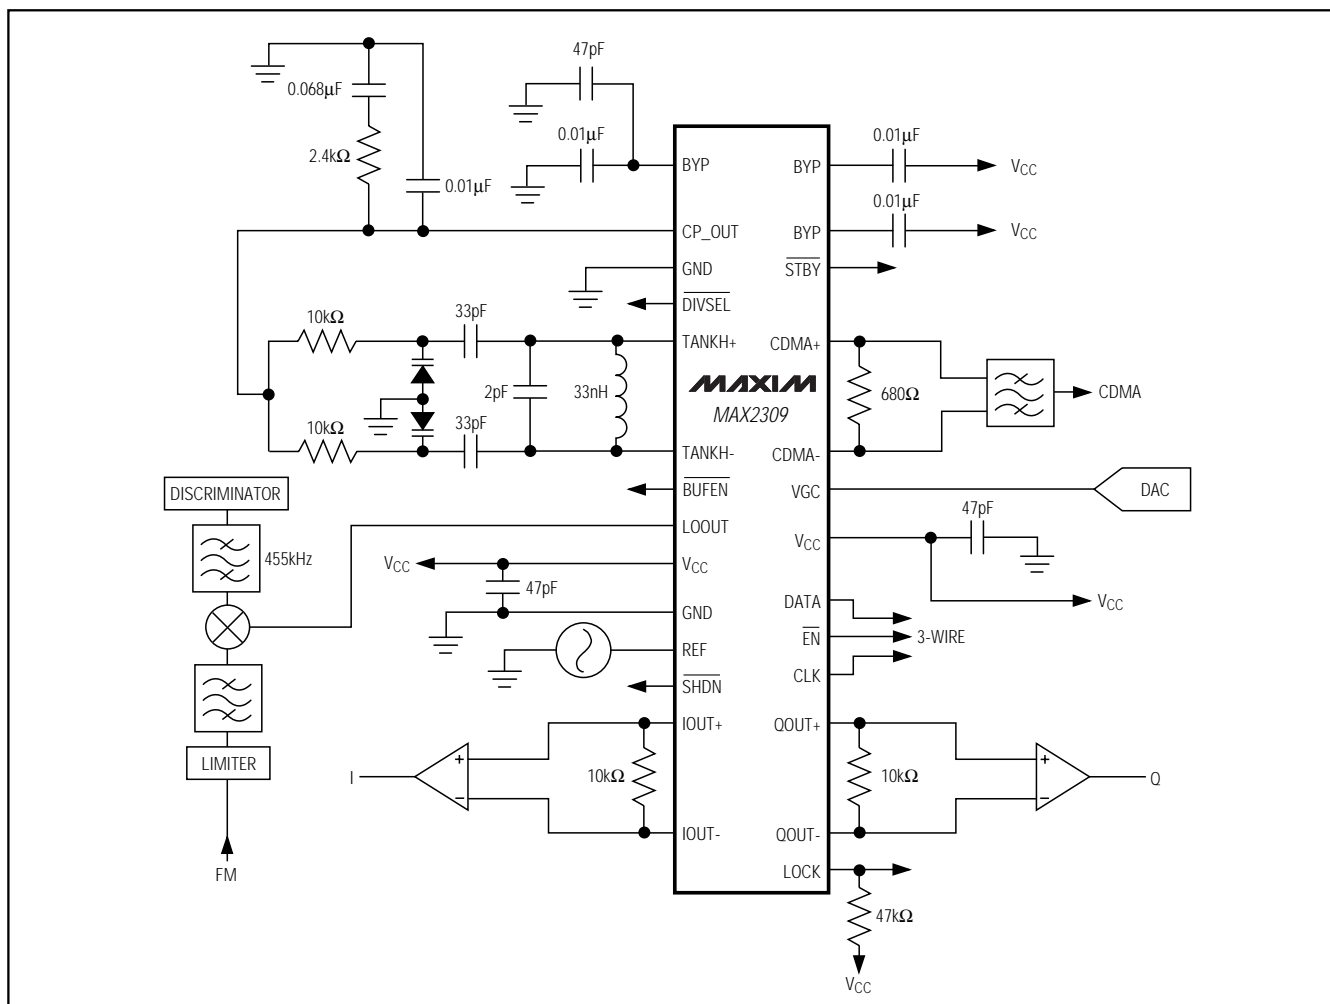

Table 3. MAX2309 Control Register States

OPERATIONAL MODE	ACTION RESULT	PINS				CONTROL REGISTER													LSB
		$\overline{\text{SHDN}}$	DIVSEL	$\overline{\text{BUFEN}}$	$\overline{\text{STBY}}$	TEST_MODE	CP_POL	TES_TEN	TURBOCHARGE	DIVSEL	VCO_BYP	VCO_SEL	BUF_DIV	$\overline{\text{BUFEN}}$	FM_TYPE	IN_SEL	$\overline{\text{STBY}}$	$\overline{\text{SHDN}}$	LSB
SHUTDOWN	Shutdown pin completely powers down the chip	L	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
SHUTDOWN	0 in shutdown register bit leaves serial bus active	H	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	0
STANDBY	0 in standby pin turns off VGA and modulator only	H			L			0				X					X	1	
STANDBY	0 in standby register bit turns off VGA and modulator only	H	H/L	H				0				X					0	1	
DIVIDER SELECT	DIVSEL pin overrides DIVSEL register bit	H	H/L		H			0		X		X							1
DIVIDER SELECT	If DIVSEL pin is floated, then register bit selects divider	H	F		H			0		1/0		X							1
LO BUFFER ENABLE	$\overline{\text{BUFEN}}$ pin controls the LO buffer and overrides the bit	H/L		H				0				X		X					1
LO BUFFER ENABLE	If pin is floated, then $\overline{\text{BUFEN}}$ register bit controls buffer	H		F				0				X		1/0					1

Note: H = high, L = low, 1 = logic high, 0 = logic low, X = don't care, blank = independent parameter.

Table 4. Control Register, Default State: 0B57h, Address: 110b

BIT ID	BIT NAME	POWER-UP STATE	BIT LOCATION 0 = LSB	FUNCTION
TM	TEST_MODE	0	12	Must be 0 for normal operation.
POL	CP_POL	1	11	Logic "1" causes the charge-pump output CP_OUT to source current when $f_{REF}/R > f_{VCO}/M$. This state is used when the VCO tune polarity is such that increasing voltage produces increasing frequency. Logic "0" causes CP_OUT to source current when $f_{VCO}/M > f_{REF}/R$. This state is used when increasing tune voltage causes the VCO frequency to decrease.
TE	TEST_ENABLE	0	10	Must be 0 for normal operation.
TC	TURBO_CHARGE	1	9	Logic "1" activates turbocharge mode, which provides rapid frequency acquisition in the PLL.
DS	DIV_SEL	1	8	Logic "1" selects M1/R1 divide ratios. Logic "0" selects M2/R2.
VB	VCO_BYP	0	7	Logic "1" bypasses the VCO inputs for external VCO operation.
VS	VCO_SEL	1	6	Logic "1" selects VCO_H. Logic "0" selects VCO_L.
BD	BUF_DIV	0	5	Logic "1" selects divide-by-2 on LOOUT port. Logic "0" bypasses divider.
BE	$\overline{\text{BUFEN}}$	1	4	Logic "1" disables LOOUT. Logic "0" enables LOOUT.
FT	FM_TYPE	0	3	Active in FM mode. Logic "0" selects quadrature demodulator for FM mode. Logic "1" selects downconversion to I port.
IS	IN_SEL	1	2	Logic "0" selects FM input port. Logic "1" selects CDMA input.
SB	$\overline{\text{STBY}}$	1	1	Logic "0" enables standby mode, which shuts down the VGA and demodulator stages, leaving the VCO locked and the registers active.
SD	$\overline{\text{SHDN}}$	1	0	Logic "0" enables register-based shutdown. This mode shuts down everything except the M and R latches and the serial bus.
