REVISION HISTORY

10/04—Revision 0: Initial Version

SPECIFICATIONS

$V_{CC} = 2.6 \text{ V to } 5.5 \text{ V}$; $T_A = -40^\circ\text{C to } +85^\circ\text{C}$, unless otherwise noted; $C_1, C_2 = 1.0 \mu\text{F}$; $C_3 = 2.2 \mu\text{F}$; $C_4 = 4.7 \mu\text{F}$

Table 1.

PARAMETER	Min	Typ	Max	Unit	Test Conditions
INPUT VOLTAGE, V_{CC}	2.6		5.5	V	
SUPPLY CURRENT, I_{CC}		2.6	5	mA	All four LEDs disabled, $V_{CC} = 3.3 \text{ V}$, $R_{SET} = 7.08 \text{ k}\Omega$, $CTRL1 = 1$, $CRTL2 = 1$
SHUTDOWN CURRENT			5	μA	
CHARGE PUMP FREQUENCY		1.5		MHz	
CHARGE PUMP MODE THRESHOLDS					
1.5× to 2×		3.33		V	
2× to 1.5×		3.36		V	
Hysteresis		40		mV	
1× to 1.5×		4.77		V	
1.5× to 1×		4.81		V	
Hysteresis		40		mV	
I_{SET} PIN					
LED : LED Matching		0.3		%	$I_{LED} = 20 \text{ mA}$, $V_{FB} = 0.4 \text{ V}$
I_{SET} Pin Voltage		1.18		V	
I_{LED} to I_{SET} Ratio		120			
I_{LED} to I_{SET} Ratio Accuracy		$\pm 5\%$			
MIN COMPLIANCE ON FBx PIN		0.15		V	$I_{SET} = 15 \text{ mA}$
CHARGE PUMP OUTPUT RESISTANCE		1.2		Ω	1× mode
		3.5		Ω	1.5× mode
		8.0		Ω	2× mode
LED CURRENT			20	mA	
PWM	0.1		200	kHz	Note 1
DIGITAL INPUTS					
Input High	0.7 V_{CC}			V	
Input Low			0.3 V_{CC}	V	
Input Leakage Current			1	μA	
CHARGE PUMP POWER EFFICIENCY		88		%	$CTRL1 = 1$, $CRTL2 = 1$, $V_{CC} = 3.4 \text{ V}$, $V_{FB} = 0.2 \text{ V}$, $I_{FB} = 20 \text{ mA}$
V_{OUT} RIPPLE		30		mV	$V_{CC} = 3.6 \text{ V}$, $I_{LED} = 20 \text{ mA}$, all four LEDs enabled

¹ Guaranteed by design. Not 100% production tested.

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted.

Table 2.

Parameter	Rating
Supply Voltage V_{CC}	–0.3 V to +6.0 V
I_{SET}	–0.3 V to +2.0 V
CTRL1, CTRL2	–0.3 V to +6.0 V
V_{OUT} Shorted ¹	Indefinite
Feedback Pins FB1 to FB4	–0.3 V to +6.0 V
Operating Temperature Range	–40°C to +85°C
V_{OUT} ²	180 mA
Storage Temperature Range	–65°C to +125°C
Power Dissipation	2 mW
ESD Class	1

¹ Short through LED.

² Based on long-term current density limitations.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL CHARACTERISTICS

16-Lead LFCSP Package:

$\theta_{JA} = 50^\circ\text{C}/\text{W}$

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2. Pin Configuration

Table 3. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	V _{OUT}	Charge Pump Output. A 2.2 μ F capacitor to ground is required on this pin. Connect V _{OUT} to the anodes of all the LEDs.
2	C2+	Flying Capacitor 2 Positive Connection.
3	I _{SET}	Bias Current Set Input. The current flowing through the R _{SET} resistor, I _{SET} , is gained up by 120 to give the I _{LED} current. Connect a resistor R _{SET} to GND to set the bias current as V _{SET} /R _{SET} . Note that V _{SET} = 1.18 V.
4, 9, 10	GND	Device Ground Pins.
5–8	FB1–FB4	LED1–LED4 Cathode Connection and Charge Pump Feedback. The current flowing in these LEDs is 120 times the current flowing through R _{SET} , I _{SET} . When using fewer than four LEDs, this pin can be left unconnected or connected to GND.
11	C2–	Flying Capacitor 2 Negative Connection.
12	CTRL2	Digital Input. 3 V CMOS Logic. Used with CTRL1 to control the shutdown operation of the main and sub LEDs.
13	CTRL1	Digital Input. 3 V CMOS Logic. Used with CTRL2 to control the shutdown operation of the main and sub LEDs.
14	C1–	Flying Capacitor 1 Negative Connection.
15	V _{CC}	Positive Supply Voltage Input. Connect this pin to a 2.6 V to 5.5 V supply with a 4.7 μ F decoupling capacitor.
16	C1+	Flying Capacitor 1 Positive Connection.
-	EP	Expose Paddle. Connect the exposed paddle to GND.

THEORY OF OPERATION

The ADM8843 charge pump driver for LCD white LED backlights implements a multiple-gain charge pump (1×, 1.5×, 2×) to maintain the correct voltage on the anodes of the LEDs over a 2.6 V to 5.5 V (Li-Ion) input supply voltage. The charge pump automatically switches between 1×/1.5×/2× modes, based on the input voltage, to maintain sufficient drive for the LED anodes, with V_{CC} input voltages as low as 2.6 V. It also includes regulation of the charge pump output voltage for supply voltages up to 5.5 V. The ADM8843's four LEDs are arranged into two groups, main and sub. The main display can have up to three LEDs (FB1 to FB3), and the sub display has one LED (FB4) (see Figure 18). The CTRL1 and CTRL2 digital input control pins control the shutdown operation and the brightness of the main and sub displays (see Table 4).

Table 4. Shutdown Truth Table

CTRL1	CTRL2	LED Shutdown Operation
0	0	Sub Display Off / Main Display Off
0	1	Sub Display Off / Main Display On
1	0	Sub Display On / Main Display Off
1	1	Sub Display On / Main Display On

An external resistor, R_{SET} , is connected between the I_{SET} pin and GND. This resistor sets up a reference current, I_{SET} , which is internally gained up by 120 within the ADM8843 to produce I_{LED} currents of up to 20 mA/LED ($I_{LED} = I_{SET} \times 120$ and $I_{SET} = 1.18 \text{ V}/R_{SET}$). The ADM8843 uses four individual current sinks to individually sense each LED current with a typical matching performance of 0.3%. This current matching performance ensures uniform brightness across a color display.

The ADM8843 lets the user control the brightness of the white LEDs with a digital PWM signal applied to CTRL1 and/or CTRL2. The duty cycle of the applied PWM signal determines the brightness of the main and/or sub display backlight white LEDs. The ADM8843 also allows the brightness of the white LEDs to be controlled using a dc voltage (see Figure 17). Soft-start circuitry limits the in-rush current flow at power-up. The ADM8843 is fabricated using CMOS technology for minimal power consumption, and is packaged in a 16-lead lead frame chip scale package.

Figure 17. PWM Brightness Control Using a DC Voltage Applied to V_{BRIGHT}

Figure 18. Functional Block Diagram

AUTOMATIC GAIN CONTROL

The automatic gain control block controls the operation of the charge pump by selecting the appropriate gain for the charge pump. Doing so maintains sufficient drive for the LED anodes at the highest power efficiency over a 2.6 V to 5.5 V input supply range. The charge pump switching thresholds are described in Table 5.

Table 5. Charge Pump Switching Thresholds

Gain	Threshold
1.5× to 2×	3.33 V
2× to 1.5×	3.36 V
1× to 1.5×	4.77 V
1.5× to 1×	4.81 V

BRIGHTNESS CONTROL WITH A DIGITAL PWM SIGNAL

PWM brightness control provides the widest brightness control method by pulsing the white LEDs on and off using the digital input control pins, CTRL1 and/or CTRL2. PWM brightness control also removes any chromaticity shifts associated with changing the white LED current, because the LEDs operate at either zero current or full current (set by R_{SET}).

The digital PWM signal applied with a frequency of 100 Hz to 200 kHz turns the current control sinks on and off using CTRL1 and/or CTRL2. The average current through the LEDs changes with the PWM signal duty cycle. If the PWM frequency is much less than 100 Hz, flicker could be seen in the LEDs. For the ADM8843, zero duty cycle turns off the LEDs, and a 50% duty cycle results in an average LED current I_{LED} being half the programmed LED current. For example, if R_{SET} is set to program 20 mA/LED, a 50% duty cycle results in an average I_{LED} of 10 mA/LED, I_{LED} being half the programmed LED current.

Figure 19. Digital PWM Brightness Control Application Diagram

By applying a digital PWM signal to the digital input control pins, CTRL1 and/or CTRL2 adjust the brightness of the sub and/or main displays. The ADM8843's four white LEDs are organized into two groups, main display (FB1 to FB3) and sub display (FB4); refer to the Theory of Operation section.

The ADM8843's main and sub display brightness can be controlled together or separately. It does this by applying a digital PWM signal to both the CTRL1 and CTRL2 pins. The duty cycle of the applied digital PWM signal determines the brightness of the main and sub displays together. Varying the duty cycle of the applied PWM signal varies the brightness of the main and sub displays from 0% to 100%.

By holding CTRL1 low and applying a digital PWM signal to CTRL2, the sub display is turned off and the main display is turned on. Then the brightness of the main display is determined by the duty cycle of the applied digital PWM signal.

By applying a digital PWM signal to CTRL1 and holding CTRL2 low, the sub display is turned on and the main display is turned off. Then the brightness of the sub display is determined by the duty cycle of the applied digital PWM signal.

By applying a digital PWM signal to CTRL1 and holding CTRL2 high, the sub display is turned on and the main display is turned on. Then the brightness of the sub display is determined by the duty cycle of the applied digital PWM signal. The brightness of the main display is set to the maximum (maximum is set by R_{SET}).

By holding CTRL1 high and applying a digital PWM signal to CTRL2, the sub display is turned on and the main display is turned on. Then the brightness of the main display is determined by the duty cycle of the applied digital PWM signal. The brightness of the sub display is set to the maximum (maximum is set by R_{SET}).

When CTRL1 and CTRL2 are low, the LED current control sinks shutdown. Shutdown of the charge pump is delayed by 15 ms. This timeout period, t_{CP} , allows the ADM8843 to determine if a digital PWM signal is present on CTRL1 and CTRL2, or if the user has selected a full chip shutdown (see Figure 20).

If digital PWM brightness control of the LEDs is not required, a constant Logic Level 1 (V_{CC}) or 0 (GND) must be applied.

The four white LED in the ADM8843 are arranged into two groups, sub and main. It is possible to configure the four LEDs as in Table 6. Refer also to Figure 20.

Table 6. Digital Inputs Truth Table

CTRL1	CTRL2	LED Operation
0	0	Sub Display Off / Main Display Off (Full Shutdown) ^{1,2}
0	1	Sub Display Off / Main Display On ^{1,3}
1	0	Sub Display On / Main Display Off ^{1,2}
1	1	Sub Display On / Main Display On (Full On) ^{1,3}
0	PWM	Sub Display Off/ Digital PWM Brightness Control on Main Display ^{4,5}
PWM	0	Digital PWM Brightness Control on Sub Display / Main Display Off ^{2,4}
1	PWM	Sub Display On/ Digital PWM Brightness Control on Main Display ^{1,5}
PWM	1	Digital PWM Brightness Control on Sub Display / Main Display On ⁵
PWM	PWM	Digital PWM Brightness Control on Sub and Main Display

¹ Sub display on means the display is on with the maximum brightness set by the R_{SET} resistor. CTRL1 = 1 means a constant logic level (V_{CC}) is applied to CTRL1.

² Main display off means the main display only is off. CTRL2 = 0 means a constant logic level (GND) is applied to CTRL2.

³ Main display on means the display is on with the maximum brightness set by the R_{SET} resistor. CTRL2 = 1 means a constant logic level (V_{CC}) is applied to CTRL2.

⁴ Sub display off means the sub display LEDs only is off. CTRL1 = 0 means a constant logic level (GND) is applied to CTRL1.

⁵ PWM means a digital PWM signal is applied to the CTRL1 and/or the CTRL2 pin with a frequency from 100 Hz to 200 kHz.

Figure 20. Application Timing

LED BRIGHTNESS CONTROL USING A PWM SIGNAL APPLIED TO V_{PWM}

Adding two external resistors and a capacitor, as shown in Figure 21, can also be used for PWM brightness control. This PWM brightness control method can be used instead of CTRL1 and/or CTRL2 digital PWM brightness control. With this configuration, CTRL1 and CTRL2 digital logic pins can control shutdown of the white LEDs, while V_{PWM} can control the brightness of all the white LEDs. This is done by applying a high frequency PWM signal (amplitude 0 V to 2.5 V) to drive an R-C-R filter on the I_{SET} pin of the ADM8843. A 0% PWM duty cycle corresponds to 20 mA/LED, while a 100% PWM duty cycle corresponds to a 0 mA/LED. At PWM frequencies above 5 kHz, C5 may be reduced (see Figure 21). The amplitude of the PWM signal must be 0 V and 2.5 V only in order to have 20 mA flowing in each LED.

$$I_{LED} = \frac{I_{SET} - \text{Voltage}}{\frac{R_{SET} \times 2R}{R_{SET} + 2R}} \times 120 \times \frac{(1 - \text{Duty Cycle})}{100}$$

Figure 21. PWM Brightness Control Using Filter-PWM Signal

LED BRIGHTNESS CONTROL USING A DC VOLTAGE APPLIED TO V_{BRIGHT}

By adding one resistor, as shown in Figure 17, this configuration can also be used for brightness control of the white LEDs by using a dc voltage applied to the V_{BRIGHT} node. Figure 22 shows an application example of LED brightness control using a dc voltage with a amplitude of 0 V to 2.5 V applied to V_{BRIGHT} .

The equation for I_{LED} is

$$I_{SET} = [(1/R_{SET} + 1/R)(V_{SET})] - [(1/R)(V_{BRIGHT})]$$

$$I_{LED} = 120 \times I_{SET}$$

where:

$R = 15\text{ k}\Omega$

V_{SET} = voltage at I_{SET} pin (1.18 V)

Figure 22. PWM Brightness Control Application Diagram Using a DC Voltage Applied to V_{BRIGHT}

APPLICATIONS

LAYOUT CONSIDERATIONS AND NOISE

Because of the ADM8843's switching behavior, PCB trace layout is an important consideration. To ensure optimum performance, a ground plane should be used, and all capacitors (C1, C2, C3, C4) must be located with minimal track lengths to the pins of the ADM8843.

WHITE LED SHORTING

If an LED is shorted, the ADM8843 continues to drive the remaining LEDs with I_{LED} per LED ($I_{LED} = I_{SET} \times 120 \text{ mA}$). This is because the ADM8843 uses four internal current sinks to produce the LED current. If an LED is shorted, the ADM8843 continues to sink ($I_{SET} \times 120$

DRIVING FOUR LEDs IN THE MAIN DISPLAY ONLY

The ADM8843 can be operated with four LEDs in the main display only (see Figure 23). With this configuration, CTRL1 and CTRL2 are used together to control the main display shutdown operation and brightness control.

DRIVING FEWER THAN FOUR LEDs

The ADM8843 can be operated with fewer than four LEDs in parallel by simply leaving the unused FBx pins floating or by connecting them to GND. For example, Figure 24 shows three LEDs being powered by the ADM8843.

Figure 23. Driving Four White LEDs

Figure 24. Driving Three White LEDs

Figure 25. Typical Application Diagram

USING SMALLER CAPACITOR VALUES

The ADM8843 can be operated with the smaller capacitor values described here to reduce capacitor footprint sizes.

Option 1

Input and output ripple plots for 1× and 1.5× mode operation are shown with C1, C2 = 0.22 μ F; C3 = 0.47 μ F and C4 = 1 μ F.

Figure 26. 1× Mode Operation with Four LEDs with 20 mA/LED at $V_{CC} = 5.0$ V, with a 1 μ F V_{CC} Decoupling Capacitor

Figure 27. 1.5× Mode Operation with Four LEDs with 20 mA/LED at $V_{CC} = 3.6$ V, with a 1 μ F V_{CC} Decoupling Capacitor

Option 2

Input and output ripple plots for 1× and 1.5× mode operation are shown with C1, C2 = 0.22 μ F; C3 = 0.47 μ F and C4 = 4.7 μ F.

Figure 28. 1× Mode Operation with Four LEDs with 20 mA/LED at $V_{CC} = 5.0$ V, with a 4.7 μ F V_{CC} Decoupling Capacitor

Figure 29. 1.5× Mode Operation with Four LEDs with 20 mA/LED at $V_{CC} = 3.6$ V, with a 4.7 μ F V_{CC} Decoupling Capacitor

POWER EFFICIENCY

The ADM8843 power efficiency (η) equations are as follows:

$$\eta = P_{OUT}/P_{IN}$$

$$P_{IN} = ((V_{CC} \times I_{LOAD} \times Gain) + (I_Q \times V_{CC}))$$

$$P_{OUT} = 4 \times (V_F \times I_{LED})$$

where:

I_Q is the quiescent current of the ADM8843, 2.6 mA.

V_F is the LED forward voltage.

$Gain$ is the charge pump mode (1 $\times$, 1.5 $\times$, 2 $\times$).

Example 1

The ADM8843 driving four white LED with 20 mA/LED at $V_{CC} = 3.4$ V (1.5 $\times$ mode), LED $V_F = 4.5$ V.

$$P_{IN} = ((V_{CC} \times I_{LOAD} \times Gain) + (V_{CC} \times I_Q))$$

$$P_{IN} = ((3.4 \times 80 \text{ mA} \times 1.5) + (3.4 \times 2.6 \text{ mA}))$$

$$P_{IN} = ((0.408) + (0.00884))$$

$$P_{IN} = 0.41684$$

$$P_{OUT} = 4(V_F \times I_{LED})$$

$$P_{OUT} = 4(4.5 \text{ V} \times 20 \text{ mA})$$

$$P_{OUT} = 0.36$$

$$\eta = P_{OUT}/P_{IN}$$

$$\eta = 0.36/0.41684$$

$$\eta = 87 \%$$

Figure 30. Charge Pump Power Efficiency Diagram, Example 1

Example 2

The ADM8843 driving four white LED with 20 mA/LED at $V_{CC} = 3.4$ (1.5 $\times$ mode), LED $V_F = 3.6$ V.

$$P_{IN} = ((V_{CC} \times I_{LOAD} \times Gain) + (V_{CC} \times I_Q))$$

$$P_{IN} = ((3.4 \times 80 \text{ mA} \times 1.5) + (3.4 \times 2.6 \text{ mA}))$$

$$P_{IN} = ((0.408) + (0.00884))$$

$$P_{IN} = 0.41684$$

$$P_{OUT} = 4(V_F \times I_{LED})$$

$$P_{OUT} = 4(3.6 \text{ V} \times 20 \text{ mA})$$

$$P_{OUT} = 0.288$$

$$\eta = P_{OUT}/P_{IN}$$

$$\eta = 0.288/0.41684$$

$$\eta = 70 \%$$
