

64K x 32 3.3V Synchronous SRAM Pipelined Outputs Burst Counter, Single Cycle Deselect

IDT71V632

Features

- ◆ 64K x 32 memory configuration
- ◆ Supports high system speed:
 - Commercial:
 - A4 4.5ns clock access time (117 MHz)
 - Commercial and Industrial:
 - 5 5ns clock access time (100 MHz)
 - 6 6ns clock access time (83 MHz)
 - 7 7ns clock access time (66 MHz)
- ◆ Single-cycle deselect functionality (Compatible with Micron Part # MT58LC64K32D7LG-XX)
- ◆ LBO input selects interleaved or linear burst mode
- ◆ Self-timed write cycle with global write control ($\overline{GW}$), byte write enable ($\overline{BWE}$), and byte writes ($\overline{BWx}$)
- ◆ Power down controlled by ZZ input
- ◆ Operates with a single 3.3V power supply (+10/-5%)
- ◆ Packaged in a JEDEC Standard 100-pin rectangular plastic thin quad flatpack (TQFP).

Description

The IDT71V632 is a 3.3V high-speed SRAM organized as 64K x 32

with full support of the Pentium™ and PowerPC™ processor interfaces. The pipelined burst architecture provides cost-effective 3-1-1-1 secondary cache performance for processors up to 117MHz.

The IDT71V632 SRAM contains write, data, address, and control registers. Internal logic allows the SRAM to generate a self-timed write based upon a decision which can be left until the extreme end of the write cycle.

The burst mode feature offers the highest level of performance to the system designer, as the IDT71V632 can provide four cycles of data for a single address presented to the SRAM. An internal burst address counter accepts the first cycle address from the processor, initiating the access sequence. The first cycle of output data will be pipelined for one cycle before it is available on the next rising clock edge. If burst mode operation is selected ($\overline{ADV}$ =LOW), the subsequent three cycles of output data will be available to the user on the next three rising clock edges. The order of these three addresses will be defined by the internal burst counter and the $\overline{LBO}$ input pin.

The IDT71V632 SRAM utilizes IDT's high-performance, high-volume 3.3V CMOS process, and is packaged in a JEDEC Standard 14mm x 20mm 100-pin thin plastic quad flatpack (TQFP) for optimum board density in both desktop and notebook applications.

Pin Description Summary

A0–A15	Address Inputs	Input	Synchronous
$\overline{CE}$	Chip Enable	Input	Synchronous
CS0, $\overline{CS}1$	Chips Selects	Input	Synchronous
$\overline{OE}$	Output Enable	Input	Asynchronous
$\overline{GW}$	Global Write Enable	Input	Synchronous
$\overline{BWE}$	Byte Write Enable	Input	Synchronous
$\overline{BW}1$, $\overline{BW}2$, $\overline{BW}3$, $\overline{BW}4$	Individual Byte Write Selects	Input	Synchronous
CLK	Clock	Input	N/A
$\overline{ADV}$	Burst Address Advance	Input	Synchronous
$\overline{ADSC}$	Address Status (Cache Controller)	Input	Synchronous
$\overline{ADSP}$	Address Status (Processor)	Input	Synchronous
$\overline{LBO}$	Linear / Interleaved Burst Order	Input	DC
ZZ	Sleep Mode	Input	Asynchronous
I/O0–I/O31	Data Input/Output	I/O	Synchronous
VDD, VDDQ	3.3V	Power	N/A
VSS, VSSQ	Array Ground, I/O Ground	Power	N/A

PowerPC is a trademark of International Business Machines, Inc.

AUGUST 2000

Pin Definitions⁽¹⁾

Symbol	Pin Function	I/O	Active	Description
A0–A15	Address Inputs	I	N/A	Synchronous Address inputs. The address register is triggered by a combination of the rising edge of CLK and $\overline{\text{ADSC}}$ Low or $\overline{\text{ADSP}}$ Low and $\overline{\text{CE}}$ Low.
$\overline{\text{ADSC}}$	Address Status (Cache Controller)	I	LOW	Synchronous Address Status from Cache Controller. $\overline{\text{ADSC}}$ is an active LOW input that is used to load the address registers with new addresses. $\overline{\text{ADSC}}$ is NOT GATED by $\overline{\text{CE}}$.
$\overline{\text{ADSP}}$	Address Status (Processor)	I	LOW	Synchronous Address Status from Processor. $\overline{\text{ADSP}}$ is an active LOW input that is used to load the address registers with new addresses. $\overline{\text{ADSP}}$ is gated by $\overline{\text{CE}}$.
$\overline{\text{ADV}}$	Burst Address Advance	I	LOW	Synchronous Address Advance. $\overline{\text{ADV}}$ is an active LOW input that is used to advance the internal burst counter, controlling burst access after the initial address is loaded. When this input is HIGH the burst counter is not incremented; that is, there is no address advance.
$\overline{\text{BWE}}$	Byte Write Enable	I	LOW	Synchronous byte write enable gates the byte write inputs $\overline{\text{BW1}}\text{--}\overline{\text{BW4}}$. If $\overline{\text{BWE}}$ is LOW at the rising edge of CLK then $\overline{\text{BWx}}$ inputs are passed to the next stage in the circuit. A byte write can still be blocked if $\overline{\text{ADSP}}$ is LOW at the rising edge of CLK. If $\overline{\text{ADSP}}$ is HIGH and $\overline{\text{BWx}}$ is LOW at the rising edge of CLK then data will be written to the SRAM. If $\overline{\text{BWE}}$ is HIGH then the byte write inputs are blocked and only $\overline{\text{GW}}$ can initiate a write cycle.
$\overline{\text{BW1}}\text{--}\overline{\text{BW4}}$	Individual Byte Write Enables	I	LOW	Synchronous byte write enables. $\overline{\text{BW1}}$ controls I/O(7:0), $\overline{\text{BW2}}$ controls I/O(15:8), etc. Any active byte write causes all outputs to be disabled. $\overline{\text{ADSP}}$ LOW disables all byte writes. $\overline{\text{BW1}}\text{--}\overline{\text{BW4}}$ must meet specified setup and hold times with respect to CLK.
$\overline{\text{CE}}$	Chip Enable	I	LOW	Synchronous chip enable. $\overline{\text{CE}}$ is used with CS_0 and $\overline{\text{CS}}_1$ to enable the IDT71V632. $\overline{\text{CE}}$ also gates $\overline{\text{ADSP}}$.
CLK	Clock	I	N/A	This is the clock input. All timing references for the device are made with respect to this input.
CS_0	Chip Select 0	I	HIGH	Synchronous active HIGH chip select. CS_0 is used with $\overline{\text{CE}}$ and $\overline{\text{CS}}_1$ to enable the chip.
$\overline{\text{CS}}_1$	Chip Select 1	I	LOW	Synchronous active LOW chip select. $\overline{\text{CS}}_1$ is used with $\overline{\text{CE}}$ and CS_0 to enable the chip.
$\overline{\text{GW}}$	Global Write Enable	I	LOW	Synchronous global write enable. This input will write all four 8-bit data bytes when LOW on the rising edge of CLK. $\overline{\text{GW}}$ supercedes individual byte write enables.
I/O ₀ –I/O ₃₁	Data Input/Output	I/O	N/A	Synchronous data input/output (I/O) pins. Both the data input path and data output path are registered and triggered by the rising edge of CLK.
$\overline{\text{LBO}}$	Linear Burst Order	I	LOW	Asynchronous burst order selection DC input. When $\overline{\text{LBO}}$ is HIGH the Interleaved (Intel) burst sequence is selected. When $\overline{\text{LBO}}$ is LOW the Linear (PowerPC) burst sequence is selected. $\overline{\text{LBO}}$ is a static DC input and must not change state while the device is operating.
$\overline{\text{OE}}$	Output Enable	I	LOW	Asynchronous output enable. When $\overline{\text{OE}}$ is LOW the data output drivers are enabled on the I/O pins if the chip is also selected. When $\overline{\text{OE}}$ is HIGH the I/O pins are in a high-impedance state.
V _{DD}	Power Supply	N/A	N/A	3.3V core power supply inputs.
V _{DDQ}	Power Supply	N/A	N/A	3.3V I/O power supply inputs.
V _{SS}	Ground	N/A	N/A	Core ground pins.
V _{SSQ}	Ground	N/A	N/A	I/O ground pins.
NC	No Connect	N/A	N/A	NC pins are not electrically connected to the chip.
ZZ	Sleep Mode	I	HIGH	Asynchronous sleep mode input. ZZ HIGH will gate the CLK internally and power down the IDT71V632 to its lowest power consumption level. Data retention is guaranteed in Sleep Mode.

NOTE:

1. All synchronous inputs must meet specified setup and hold times with respect to CLK.

Absolute Maximum Ratings⁽¹⁾

Symbol	Rating	Value	Unit
V _{TERM} ⁽²⁾	Terminal Voltage with Respect to GND	-0.5 to +4.6	V
V _{TERM} ⁽³⁾	Terminal Voltage with Respect to GND	-0.5 to V _{DD} +0.5	V
T _A	Operating Temperature	0 to +70	°C
T _{BIAS}	Temperature Under Bias	-55 to +125	°C
T _{STG}	Storage Temperature	-55 to +125	°C
P _T	Power Dissipation	1.0	W
I _{OUT}	DC Output Current	50	mA

3619 tbl 05

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V_{DD}, V_{DDQ} and Input terminals only.
- I/O terminals.

Capacitance

(T_A = +25°C, f = 1.0MHz, TQFP package)

Symbol	Parameter ⁽¹⁾	Conditions	Max.	Unit
C _{IN}	Input Capacitance	V _{IN} = 3dV	6	pF
C _{I/O}	I/O Capacitance	V _{OUT} = 3dV	7	pF

3619 tbl 06

NOTE:

- This parameter is guaranteed by device characterization, but not production tested.

Recommended Operating Temperature and Supply Voltage

Grade	Temperature	V _{SS}	V _{DD}	V _{DDQ}
Commercial	0°C to +70°C	0V	3.3V+10/-5%	3.3V+10/-5%
Industrial	-40°C to +85°C	0V	3.3V+10/-5%	3.3V+10/-5%

3619 tbl 03

Recommended DC Operating Conditions

Symbol	Parameter	Min.	Max.	Unit
V _{DD}	Core Supply Voltage	3.135	3.63	V
V _{DDQ}	I/O Supply Voltage	3.135	3.63	V
V _{SS} , V _{SSQ}	Ground	0	0	V
V _{IH}	Input High Voltage — Inputs	2.0	5.0 ⁽¹⁾	V
V _{IH}	Input High Voltage — I/O	2.0	V _{DDQ} +0.3 ⁽²⁾	V
V _{IL}	Input Low Voltage	-0.3 ⁽³⁾	0.8	V

3619 tbl 04

NOTES:

- V_{IH} (max) = 6.0V for pulse width less than tc_{yc}/2, once per cycle.
- V_{IH} (max) = V_{DDQ} + 1.0V for pulse width less than tc_{yc}/2, once per cycle.
- V_{IL} (min) = -1.0V for pulse width less than tc_{yc}/2, once per cycle.

Pin Configuration

3619 drw 02

Top View TQFP

NOTES:

1. Pin 14 can either be directly connected to V_{DD} or not connected.
2. Pin 64 can be left unconnected and the device will always remain in active mode.

3619 tbl 15

NOTES:

1. Measured as HIGH above 2.0V and LOW below 0.8V.
2. Transition is measured $\pm 200\text{mV}$ from steady-state.
3. Device must be deselected when powered-up from sleep mode.
4. t_{CFG} is the minimum time required to configure the device based on the $\overline{\text{LBO}}$ input. $\overline{\text{LBO}}$ is a static input and must not change during normal operation.
5. The 71V632SA4 speed grade corresponds to a t_{CD} of 4.5ns.
6. 0°C to +70°C temperature range only.

Timing Waveform of Pipelined Read Cycle^(1,2)

3619 drw 06

NOTES:

1. O1 (Ax) represents the first output from the external address Ax. O2 (Ay) represents the first output from the external address Ay. O2 (Ay) represents the next output data in the burst sequence of the base address Ay, etc. where Ax and Ay are advancing for the four word burst in the sequence defined by the state of the LBO input.
2. Zz input is LOW and LBO is Don't Care for this cycle.
3. CS0 timing transitions are identical but inverted to the $\overline{CE}$ and $\overline{CS1}$ signals. For example, when $\overline{CE}$ and $\overline{CS1}$ are LOW on this waveform, CS0 is HIGH.

Timing Waveform of Combined Pipelined Read and Write Cycles^(1,2,3)

3619 drw 07

NOTES:

1. Device is selected through entire cycle; $\overline{OE}$ and $\overline{CS_1}$ are LOW, $\overline{CS_0}$ is HIGH.
2. ZZ input is LOW and LBO is Don't Care for this cycle.
3. O₁(A_x) represents the first output from the external address A_x. I₁(A_y) represents the first input from the external address A_y. O₁(A_z) represents the first output from the external address A_z; O₂(A_z) represents the next output data in the burst sequence of the base address A_z, etc. where A₀ and A₁ are advancing for the four word burst in the sequence defined by the state of the LBO input.

Timing Waveform of Write Cycle No. 1 — $\overline{\text{GW}}$ Controlled^(1,2,3)

NOTES:

1. Z input is LOW, $\overline{\text{BWE}}$ is HIGH, and $\overline{\text{LBO}}$ is Don't Care for this cycle.
2. $04(\text{Aw})$ represents the final output data in the burst sequence of the base address Aw . $11(\text{Ay})$ represents the first input from the external address Ay ; $12(\text{Ay})$ represents the next input data in the burst sequence of the base address Ay , etc. where A0 and A1 are advancing for the four word burst in the sequence defined by the state of the $\overline{\text{LBO}}$ input. In the case of input $12(\text{Ay})$ this data is valid for two cycles because $\overline{\text{ADV}}$ is high and has suspended the burst.
3. CS0 timing transitions are identical but inverted to the $\overline{\text{CE}}$ and $\overline{\text{CS1}}$ signals. For example, when $\overline{\text{CE}}$ and $\overline{\text{CS1}}$ are LOW on this waveform, CS0 is HIGH.

3619 dw 08

Timing diagram for ADSP1000 showing signals CLK, ADSP, ADSC, ADDRESS, BWE, BWx, OE, CS1, ADV, OE, DATAIN, and DATAOUT. The diagram illustrates various timing parameters such as t_{CYC} , t_{CH} , t_{CL} , t_{SS} , t_{HS} , t_{SA} , t_{HA} , t_{SC} , t_{HC} , t_{SW} , t_{HW} , t_{SD} , t_{HD} , t_{SAV} , and t_{OHZ} . It also shows data bus activity for burst reads and writes, including address and data values like 11(Ax), 12(Ay), 13(Ay), 14(Ay), 11(Az), 12(Az), and 13(Az).

1. ZZ input is LOW, $\overline{\text{GW}}$ is HIGH, and $\overline{\text{LBO}}$ is Don't Care for this cycle.
2. O4(Aw) represents the final output data in the burst sequence of the base address $\text{Aw}_{11}(\text{Ax})$ represents the first input from the external address $\text{Ay}_{12}(\text{Ay})$ represents the next input data in the burst sequence of the base address Ay , etc. where Ao and A1 are advancing for the four word burst in the sequence defined by the state of the $\overline{\text{LBO}}$ input. In the case of input I2(Ay) this data is valid for two cycles because ADV is high and has suspended the burst.
3. CS0 timing transitions are identical but inverted to the $\overline{\text{CE}}$ and $\overline{\text{CS1}}$ signals. For example, when $\overline{\text{CE}}$ and $\overline{\text{CS1}}$ are LOW on this waveform, CS0 is HIGH.

Timing Waveform of Sleep (ZZ) and Power-Down Modes^(1,2,3)

NOTES:

1. Device must power up in deselected Mode.
2. $\overline{LB0}$ input is Don't Care for this cycle.
3. It is not necessary to retain the state of the input registers throughout the Power-down cycle.
4. CS0 timing transitions are identical but inverted to the $\overline{CE}$ and $\overline{CS1}$ signals. For example, when $\overline{CE}$ and $\overline{CS1}$ are LOW on this waveform, CS0 is HIGH.

Non-Burst Read Cycle Timing Waveform

3619 drw 11

NOTES:

1. ZZ input is LOW, $\overline{ADV}$ is HIGH and $\overline{LBO}$ is Don't Care for this cycle.
2. (A_x) represents the data for address A_x , etc.
3. For read cycles, $\overline{ADSP}$ and $\overline{ADSC}$ function identically and are therefore interchangeable.

Non-Burst Write Cycle Timing Waveform

3619 drw 12

NOTES:

1. ZZ input is LOW, $\overline{ADV}$ and $\overline{OE}$ are HIGH, and $\overline{LBO}$ is Don't Care for this cycle.
2. (Ax) represents the data for address Ax, etc.
3. Although only $\overline{GW}$ writes are shown, the functionality of $\overline{BWE}$ and $\overline{BWx}$ together is the same as $\overline{GW}$.
4. For write cycles, $\overline{ADSP}$ and $\overline{ADSC}$ have different limitations.

Datasheet Document History

9/9/99		Updated to new format
	Pg. 1, 8, 9, 17	Revised speed offerings to 66–117MHz
	Pg. 15, 16	Added non-burst read and write cycle timing diagrams
	Pg. 18	Added Datasheet Document History
09/30/99	Pg. 1, 4, 8, 9, 17	Added industrial temperature range offerings
04/04/00	Pg. 17	Added 100pinTQFP package Diagram Outline
08/09/00		Not recommended for new designs
