

DN8897/SE/TE/S

Hall IC (Operating Temperature Range
 $T_{opr} = -40$ to $+100^{\circ}\text{C}$,
 Operating in Alternative Magnetic Field)

Overview

The DN8897/SE/TE/S is a combination of a Hall element, amplifier, Schmidt circuit, and stabilized power supply/temperature compensator integrated on an identical chip by using the IC technology. It amplifies Hall element output at the amplifier, converts into a digital signal through the Schmidt circuit, and drives the TTL or MOS IC directly.

Features

- High sensitivity and low drift
- Stable temperature characteristics due to the additional temperature compensator
- Wide operating supply voltage range ($V_{CC} = 4.5$ to 16V)
- Operating in alternative magnetic field
- TTL and MOS ICs directly drivable by output
- Provided with the output pull-up resistors (typ $27\text{k}\Omega$)
- "0" gauss point in the zero cross type hysteresis width

Applications

- Speed sensors
- Position sensors
- Rotation sensors
- Keyboard switches
- Microswitches

Note) This IC is not suitable for car electrical equipment.

■ Flux-Voltage Conversion Characteristics

■ Precaution on Use

- 1. Change of the operation magnetic flux density dose not depend on the supply voltage, because the stabilization power supply is built-in. (only for the range ; $V_{CC} = 4.5$ to $16V$)
- 2. Change from “H” to “L” level increases the supply current by approx. 1mA.
