

CMOS Static RAM 64K (8K x 8-Bit)

IDT7164S
IDT7164L

Features

- ♦ High-speed address/chip select access time
 - Military: 20/25/35/45/55/70/85/100ns (max.)
 - Industrial: 25/35ns (max.)
 - Commercial: 15/20/25/35ns (max.)
- ♦ Low power consumption
- ♦ Battery backup operation – 2V data retention voltage (L Version only)
- ♦ Produced with advanced CMOS high-performance technology
- ♦ Inputs and outputs directly TTL-compatible
- ♦ Three-state outputs
- ♦ Available in 28-pin DIP, Cerdip and SOJ
- ♦ Military product compliant to MIL-STD-883, Class B

Description

The IDT7164 is a 65,536 bit high-speed static RAM organized as 8K x 8. It is fabricated using IDT's high-performance, high-reliability CMOS technology.

Address access times as fast as 15ns are available and the circuit offers a reduced power standby mode. When $\overline{CS}_1$ goes HIGH or CS2 goes LOW, the circuit will automatically go to, and remain in, a low-power stand by mode. The low-power (L) version also offers a battery backup data retention capability at power supply levels as low as 2V.

All inputs and outputs of the IDT7164 are TTL-compatible and operation is from a single 5V supply, simplifying system designs. Fully static asynchronous circuitry is used, requiring no clocks or refreshing for operation.

The IDT7164 is packaged in a 28-pin 300 mil DIP and SOJ and a 28-pin 600 mil Cerdip.

Military grade product is manufactured in compliance with the latest revision of MIL-STD-883, Class B, making it ideally suited to military temperature applications demanding the highest level of performance and reliability.

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V_{TERM} must not exceed $V_{CC} + 0.5V$.

Timing Waveform of Read Cycle No. 1⁽¹⁾

2967 drw 05

Timing Waveform of Read Cycle No. 2^(1,2,4)

2967 drw 06

Timing Waveform of Read Cycle No. 3^(1,3,4)

NOTES:

1. $\overline{WE}$ is HIGH for Read cycle.
2. Device is continuously selected, $\overline{CS1}$ is LOW, $CS2$ is HIGH.
3. Address valid prior to or coincident with $\overline{CS1}$ transition LOW and $CS2$ transition HIGH.
4. $\overline{OE}$ is LOW.
5. Transition is measured $\pm 200\text{mV}$ from steady state.

2967 drw 07

Timing Waveform of Write Cycle No. 1 ($\overline{WE}$ Controlled Timing)^(1,5)

2967 drw 08

Timing Waveform of Write Cycle No. 2 ($\overline{CS}$ Controlled Timing)⁽¹⁾

2967 drw 09

NOTES:

1. A write occurs during the overlap of a LOW $\overline{WE}$, a LOW $\overline{CS1}$ and a HIGH $CS2$.
2. $tWR1,2$ is measured from the earlier of $\overline{CS1}$ or $\overline{WE}$ going HIGH or $CS2$ going LOW to the end of the write cycle.
3. During this period, I/O pins are in the output state so that the input signals must not be applied.
4. If the $\overline{CS1}$ LOW transition or $CS2$ HIGH transition occurs simultaneously with or after the $\overline{WE}$ LOW transition, the outputs remain in a high-impedance state.
5. $\overline{OE}$ is continuously HIGH. If $\overline{OE}$ is LOW during a $\overline{WE}$ controlled write cycle, the write pulse width must be the larger of tWP or $(tWHZ + tDW)$ to allow the I/O drivers to turn off and data to be placed on the bus for the required tOW . If $\overline{OE}$ is HIGH during a $\overline{WE}$ controlled write cycle, this requirement does not apply and the minimum write pulse width is as short as the specified tWP .
6. Transition is measured $\pm 200mV$ from steady state.
