

# M500 2.5-Inch SATA NAND Flash SSD

**MTFDDAK120MAV, MTFDDAK240MAV,  
MTFDDAK480MAV, MTFDDAK960MAV**

## Features

- Micron® 20nm MLC NAND Flash
- RoHS-compliant package
- SATA 6 Gb/s interface
- TCG/Opal 2.0-compliant self-encrypting drive (SED)
- Hardware-based AES-256 encryption engine
- ATA modes supported
  - PIO mode 3, 4
  - Multiword DMA mode 0, 1, 2
  - Ultra DMA mode 0, 1, 2, 3, 4, 5
- Industry-standard, 512-byte sector size support
- Hot-plug/hot-remove capable
- Power loss protection for data-at-rest
- Device Sleep (DEVSLEEP), extreme low-power mode
- Native command queuing support with 32-command slot support
- ATA-8 ACS2 command set compliant
- ATA security feature command set and password login support
- Secure erase (data page) command set: fast and secure erase
- Sanitize device feature set support
- Self-monitoring, analysis, and reporting technology (SMART) command set
- Windows 8 drive telemetry
- Adaptive thermal monitoring
- Power loss protection for data-at-rest
- Performance<sup>1, 2</sup>
  - PCMark® Vantage (HDD test suite score): Up to 80,000
  - Sequential 128KB READ: Up to 500 MB/s
  - Sequential 128KB WRITE: Up to 400 MB/s
  - Random 4KB READ: Up to 80,000 IOPS
  - Random 4KB WRITE: Up to 80,000 IOPS
  - READ/WRITE latency: 5ms/25ms (MAX)

- Reliability
  - MTTF: 1.2 million device hours<sup>3</sup>
  - Static and dynamic wear leveling
  - Uncorrectable bit error rate (UBER): <1 sector per 10<sup>15</sup> bits read
- Low power consumption
  - 150mW TYP<sup>4</sup>
- Endurance: Total bytes written (TBW) – Up to 500TB<sup>5</sup>
- Capacity<sup>6</sup> (unformatted): 120GB, 240GB, 480GB, 960GB
- Mechanical
  - SATA connector: 5V ±10%
  - 2.5-inch drive: 100.45mm x 69.85mm x 7.0mm
  - Weight: 70g (MAX)
- Secure firmware update with digitally signed firmware image
- Operating temperature
  - Commercial (0°C to +70°C)<sup>7</sup>

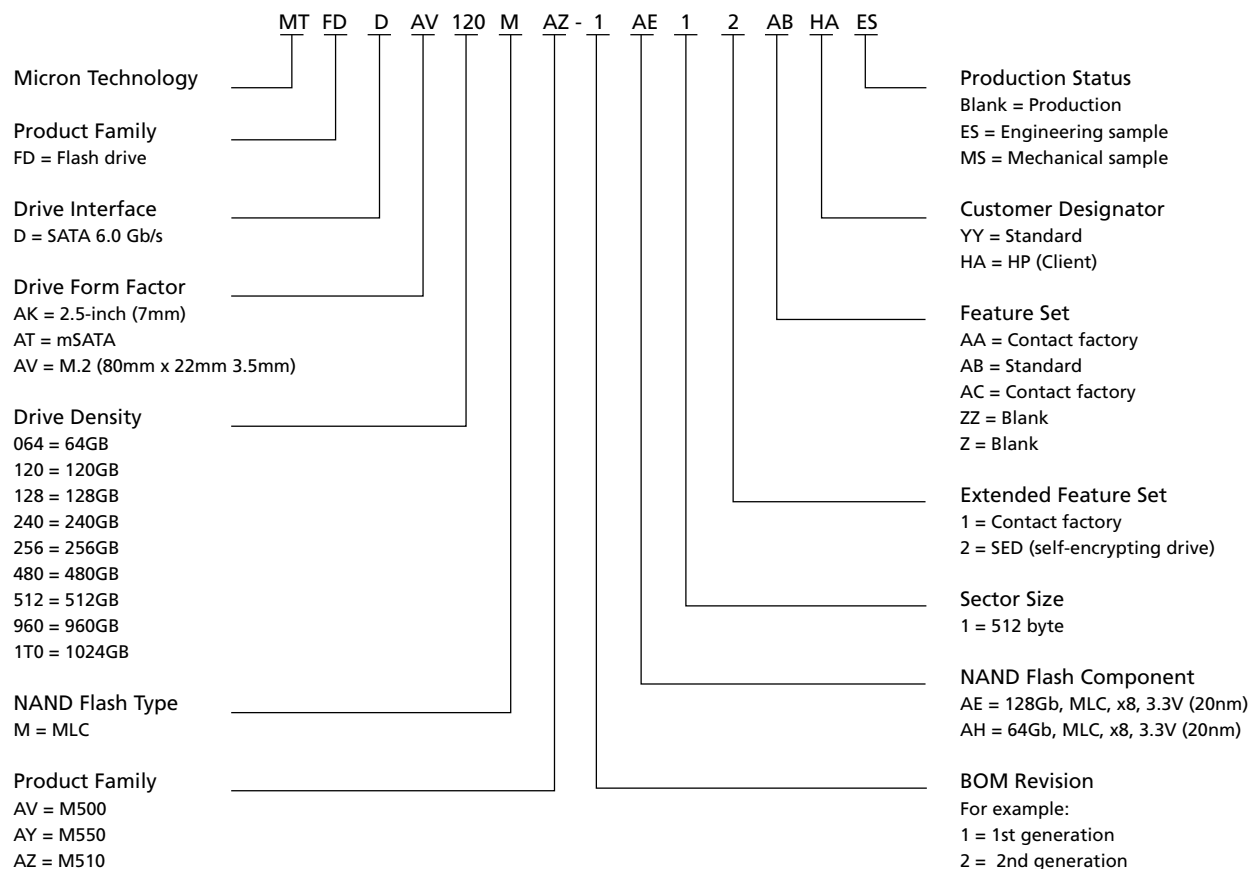

- Notes:
1. Typical I/O performance numbers as measured fresh-out-of-the-box (FOB) using Iometer with a queue depth of 32 and write cache enabled.
  2. 4KB transfers used for READ/WRITE latency values.
  3. The product achieves a mean time to failure (MTTF) based on population statistics not relevant to individual units.
  4. Active average power measured during execution of MobileMark® with DIPM (device-initiated power management) enabled.
  5. Endurance may depend highly on the nature of the data stream from the host computer. See Endurance section for more details.
  6. 1GB = 1 billion bytes; formatted capacity is less.
  7. Drive onboard temperature sensor.

**Warranty:** Contact your Micron sales representative for further information regarding the product, including product warranties.

## Part Numbering Information

Micron's M500 SSD is available in different configurations and densities. The chart below is a comprehensive list of options for the M500 series devices; not all options listed can be combined to define an offered product. Visit [www.micron.com](http://www.micron.com) for a list of valid part numbers.

**Figure 1: Part Number Chart**

## General Description

Micron's solid state drive (SSD) uses a single-chip controller with a SATA interface on the system side and 8-channels of Micron NAND Flash internally. Packaged in an HDD replacement enclosure, the SSD integrates easily in existing storage infrastructures.

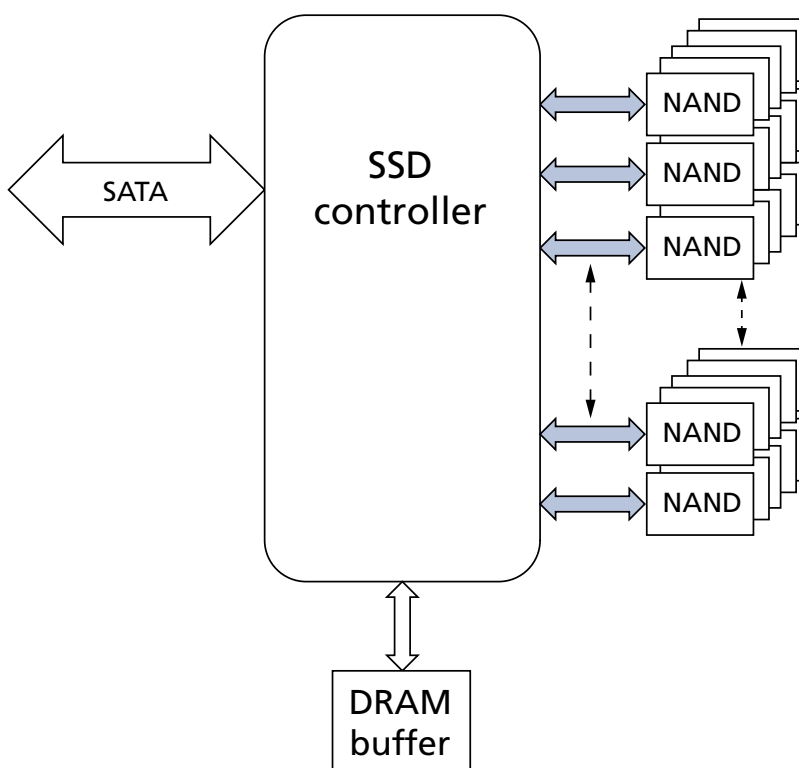

The SSD is designed to use the SATA interface efficiently during both READs and WRITEs while delivering bandwidth-focused performance. SSD technology enables enhanced boot times, faster application load times, reduced power consumption, and extended reliability.

The self-encrypting drive (SED) features a FIPS-compliant, AES-256 encryption engine, providing hardware-based, secure data encryption, with no loss of SSD performance. This SED follows the TCG/Opal specification for trusted peripherals.

When TCG/Opal features are not enabled, the device can perform alternate data encryption by invoking the ATA security command-set encryption features, to provide full-disk encryption (FDE) managed in the host system BIOS. TCG/Opal and FDE feature sets cannot be enabled simultaneously.

The data encryption is always running; however, encryption keys are not managed and the data is not secure until either TCG/Opal or FDE feature sets are enabled.

**Figure 2: Functional Block Diagram**

## Logical Block Address Configuration

The drive is set to report the number of logical block addresses (LBA) that will ensure sufficient storage space for the specified capacity. Standard LBA settings, based on the IDEMA standard (LBA1-02), are shown below.

**Table 1: Standard LBA Settings**

Capacity	Total LBA		Max LBA		User Available Bytes
	Decimal	Hexadecimal	Decimal	Hexadecimal	(Unformatted)
120GB	234,441,648	DF94BB0	234,441,647	DF94BAF	120,034,123,776
240GB	468,862,128	1BF244B0	468,862,127	1BF244AF	240,057,409,536
480GB	937,703,088	37E436B0	937,703,087	37E436AF	480,103,981,056
960GB	1,875,385,008	6FC81AB0	1,875,385,007	6FC81AAF	960,197,124,096

## Physical Configuration

**Table 2: 2.5-Inch Dimensions and Weight**

Specification	Value		Unit
	Nom	Max

Length	100.45	–	mm
Unit weight	–	70	g
Insertion rating (cabled)	50	–	insert/remove cycles
Insertion rating (backplane)	500	–	insert/remove cycles

## Interface Connectors

The SATA signal segment interface cable has four conductors and three ground connections. As shown in Package Dimensions, the cable includes a 7-pin signal segment and a 15-pin power segment arranged in a single row with a 1.27mm (0.050in) pitch.

**Figure 3: SSD Interface Connections**

## Performance

Measured performance can vary for a number of reasons. The major factors affecting drive performance are the capacity of the drive and the interface of the host. Additionally, overall system performance can affect the measured drive performance. When comparing drives, it is recommended that all system variables are the same, and only the drive being tested varies.

Performance numbers will vary depending on the host system configuration.

For SSDs designed for the client computing market, Micron specifies performance in FOB ("fresh-out-of-box") state. Data throughput measured in "steady state" may be lower than FOB state, depending on the nature of the data workload.

For a description of these performance states and of Micron's best practices for performance measurement, refer to [micron.com/ssd](http://micron.com/ssd).

**Table 5: Drive Performance**

Capacity	120GB	240GB	480GB	960GB	Unit
Interface Speed	6 Gb/s	6 Gb/s	6 Gb/s	6 Gb/s	
PCMark Vantage	70,000	80,000	80,000	80,000	HDD score
Sequential read (128KB transfer)	500	500	500	500	MB/s
Sequential write (128KB transfer)	130	250	400	400	MB/s
Random read (4KB transfer)	62,000	72,000	80,000	80,000	IOPS
Random write (4KB transfer)	35,000	60,000	80,000	80,000	IOPS
READ latency (MAX)	5	5	5	5	ms
WRITE latency (MAX)	25	25	25	25	ms
READ latency (TYP)	160	160	160	160	μs
WRITE latency (TYP)	40	40	40	40	μs

- Notes:
1. Performance numbers are maximum values, except as noted.
  2. Typical I/O performance numbers as measured using Iometer with a queue depth of 32 and write cache enabled. Fresh-out-of-box (FOB) state is assumed. For performance measurement purposes, the SSD may be restored to FOB state using the secure erase command.
  3. Iometer measurements are performed on an 20GB span of logical block addresses (LBAs).
  4. 4KB transfers are used to measure READ/WRITE latency values with write cache enabled.
  5. System variations will affect measured results. For comparison, PCMark scores are measured with the SSD as a secondary drive in a two-drive system. When measured as an OS drive, system overhead can cause lower scores.

For a description of these performance states and of Micron's best practices for performance measurement, refer to Micron's technical marketing brief "Best Practices for SSD Performance Measurement"

## Reliability

Micron's SSDs incorporate advanced technology for defect and error management. They use various combinations of hardware-based error correction algorithms and firmware-based static and dynamic wear-leveling algorithms.

Over the life of the SSD, uncorrectable errors may occur. An uncorrectable error is defined as data that is reported as successfully programmed to the SSD but when it is read out of the SSD, the data differs from what was programmed.

**Table 6: Uncorrectable Bit Error Rate**

Uncorrectable Bit Error Rate	Operation
<1 sector per $10^{15}$ bits read	READ

## Mean Time To Failure

Mean time to failure (MTTF) for the SSD can be predicted based on the component reliability data using the methods referenced in the Telcordia SR-332 reliability prediction procedures for electronic equipment.

**Table 7: MTTF**

Capacity	MTTF (Operating Hours) <sup>1</sup>
120GB	1.2 million
240GB	1.2 million
480GB	1.2 million
960GB	1.2 million

Note: 1. The product achieves a mean time to failure (MTTF) of 1.2 million hours, based on population statistics not relevant to individual units.

## Endurance

Endurance for the SSD can be predicted based on the usage conditions applied to the device, the internal NAND component cycles, the write amplification factor, and the wear-leveling efficiency of the drive. The tables below show the drive lifetime for each SSD capacity by client computing and sequential input and based on predefined usage conditions.

**Table 8: Drive Lifetime – Client Computing**

Capacity	Drive Lifetime (Total Bytes Written)
120GB	72TB
240GB	72TB
480GB	72TB
960GB	72TB

- Notes:
1. Total bytes written calculated with the drive 90% full.
  2. SSD volatile write cache is enabled.
  3. Access patterns used during reliability testing are 25% sequential and 75% random and consist of the following: 50% are 4KiB; 40% are 64KiB; and 10% are 128KiB.
  4. Host workload parameters, including write cache settings, IO alignment, transfer sizes, randomness, and percent full, that are substantially different than the described notes, may result in varied endurance results.
  5. GB/day can be calculated by dividing the total bytes written value by (365 x number of years). For example: 72TB/5 years/365 days = 40 GB/day for 5 years.

**Table 9: Drive Lifetime – Sequential Input**

Capacity	Drive Lifetime (Total Bytes Written)
120GB	125TB
240GB	250TB
480GB	500TB
960GB	500TB

- Notes:
1. Endurance of Client SSDs in some data center applications can be maximized by implementing workloads which are sequential when writing, with read-intensive access. Micron recommends no higher than 20% of input/output operations be writes.
  2. SSD volatile write cache is enabled.
  3. Micron recommends sequential writes in transfer sizes of 128KiB or integer multiples of 128KiB which are 4KiB-aligned. Contact Micron for details.
  4. Host workload parameters, including write cache settings, IO alignment, transfer sizes, randomness, and percent full, that are substantially different than the described notes, may result in varied endurance results.

## Electrical Characteristics

Environmental conditions beyond those listed may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**Table 10: SATA Power Consumption**

Capacity	Device Sleep Average	Idle Average	Active Average	Active Maximum (128KB transfer)	Unit
120GB	<5	80	150	2100	mW
240GB	<5	95	150	3200	mW
480GB	<10	100	150	3600	mW
960GB	<20	100	150	3800	mW

- Notes:
1. Data taken at 25°C using a 6 Gb/s SATA interface.
  2. Active average power measured while running MobileMark Productivity Suite.
  3. DIPM (device-initiated power management) enabled. DIPM Slumber supported.
  4. Active maximum power is measured using Iometer with 128KB sequential write transfers.

**Table 11: Maximum Ratings**

Parameter/Condition	Symbol	Min	Max	Unit
Voltage input	V <sub>5</sub>	4.5	5.5	V
Operating temperature	T <sub>s</sub>	0	70	°C
Non-operating temperature		-40	85	°C
Rate of temperature change		–	20	°C/hour
Relative humidity (non-condensing)		5	95	%

- Notes:
1. Temperature is best measured by reading the SSD's on-board temperature sensor, which is recorded in SMART attribute 194 (or 0xC2).
  2. Power-off sequence: When the SSD is shut down, the ATA STANDBY IMMEDIATE (STBI) command should be the last command sent by the host and acknowledged by the SSD. Failure to follow this process might result in a longer than normal time-to-ready (TTR) during the subsequent power-on sequence. TTR is the time from power-on to drive ready to accept SATA commands.

**Table 12: Shock and Vibration**

Parameter/Condition	Specification
Non-operating shock	1500G/0.5ms
Non-operating vibration	5–800Hz @ 3.13G

## Adaptive Thermal Monitoring

The device features adaptive thermal monitoring. While most host computers exhibit operating environments that keep an SSD running in the range of 40°C to 45°C, adaptive thermal monitoring enables the SSD device to operate in a wide variety of environments by helping to prevent the host computer from running at excessive temperatures.

Adaptive thermal monitoring reduces NAND operations by approximately 40% when the SSD's internal measured temperature reaches 75°C. The SSD remains in this lowered performance state until the temperature returns to 65°C; the SSD then returns to normal operating mode. These transition points might occur at points somewhat different from case or ambient temperature because of thermal effects that cause a difference between temperature sensed at the PCB level and temperature at the specified operating environment.

Adaptive thermal monitoring does not change the current negotiated speed of the SATA bus, nor require or cause any new commands to be issued on the SATA bus. Rated-throughput performance is not guaranteed at any point above the maximum specified operating temperature.

The thermal monitoring feature can be disabled using ATA SET FEATURE commands as described below. The default setting is ENABLED.

**Note:** The SSD will return to the default setting after each power cycle or COMRESET command. Arrangements should be made to re-issue the DISABLE command after each power cycle or COMRESET.

## Compliance

Micron SSDs comply with the following:

- RoHS “green”
- CE (Europe): EN55022, 2006 Class B and EN55024, 1998 + A1: 2001 + A2:2003
- FCC: CFR Title 47, Part 15, ICES-003, all Class B
- UL (US): approval to UL-60950-1, 2nd Edition, 2007-03-27, IEC 60950-1:2005, 2nd Edition
- BSMI (Taiwan): approval to CNS 13438
- C-TICK (Australia, New Zealand): approval to AS/NZS CISPR22
- KCC RRL (Korea): approval to KCC MU2-C30025, KCC MU2-C30018 Class B
- W.E.E.E.: Compliance with EU WEEE directive 2002/96/EC. Additional obligations may apply to customers who place these products in the markets where WEEE is enforced.
- TUV (Germany): approval to IEC60950/EN60950
- VCCI
- IC (Canada):
  - This Class B digital apparatus complies with Canadian ICES-003.
  - Cet appareil numérique de la classe B est conforme à la norme NMB-003 du Canada.

## FCC Rules

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and the receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

## Revision History

### Rev. G– 8/14

- Added note 2 and note 4 to Table 8: Drive Lifetime – Client Computing
- Added note 2 and note 4 to Table 9: Drive Lifetime – Sequential Input

### Rev. F– 6/14

- Removed the AW = 2.5-inch (5mm) drive form factor from the Part Number Chart

### Rev. E– 9/13

- Added a power cycle note to thermal monitoring

### Rev. D– 7/13

- Revised thermal monitoring.

### Rev. C– 5/13

- Changed endurance data and added an endurance footnote on cover page.
- Revised part number chart.
- Revised and divided the drive lifetime table into two tables, a client computing table and a sequential input table, with new data for these table categories.

### Rev. B– 2/13

- Status changed from Preliminary to Production.
- Updated Physical Configuration section.
- Updated Electrical Characteristics section.

### Rev. A – 1/13

- Initial release.
