Description

The T2200 Overcurrent Relay is designed for generator or feeder protection against overcurrent in each of the three phases.

The T2200 detects the highest of the 3 input currents and, if this exceeds the preset level ($0.5 - 1.4 \times I_N$), the pick-up LED will indicate and the delay timer will be started. After the preset time (3-30 sec.) has expired, the output relay and the corresponding LED will be activated, provided that the current level was exceeded for the entire delay time.

Features & Benefits

FEATURES	BENEFITS
Accepts high supply voltage variation	Ensures correct operation in spite of voltage supply fluctuations (fulfills marine class requirement)
Visual indication of power, pick-up, and output trip	Provides quick and concise status information
Direct line-line or line-neutral voltage supply (up to 690 Vac)	Simplifies design and installation. No need for PTs.
Available with extra output with instant trip	Economic solution for tripping non-essential load, before main breaker trip
Galvanic isolated inputs	Protects the unit against high AC voltage and currents from the installation including spikes
DIN-rail or screw-mount & adjustment by potentiometers	Easy installation
