87C196KD Enhanced Feature Set over the 87C196KC

- 1. The 87C196KD has twice the RAM and twice the EPROM of the 87C196KC.
- 2. The vertical windowing scheme has been extended to allow all 1000 bytes of register RAM to be windowed into the lower register file.
- 3. A CLKOUT disable bit has been added to the IOC3 SFR. This can be used to reduce noise in systems not requiring the CLKOUT signal.

PIN DESCRIPTIONS

Symbol	Name and Function
V _{CC}	Main supply voltage (5V).
V _{SS}	Digital circuit ground (0V). There are three V _{SS} pins, all of which must be connected.
V _{REF}	Reference voltage for the A/D converter (5V). V _{REF} is also the supply voltage to the analog portion of the A/D converter and the logic used to read Port 0. Must be connected for A/D and Port 0 to function.
ANGND	Reference ground for the A/D converter. Must be held at nominally the same potential as V _{SS} .
V _{PP}	Timing pin for the return from powerdown circuit. Connect this pin with a 1 μ F capacitor to V _{SS} and a 1 M Ω resistor to V _{CC} . If this function is not used V _{PP} may be tied to V _{CC} . This pin is the programming voltage on the EPROM device.
XTAL1	Input of the oscillator inverter and of the internal clock generator.
XTAL2	Output of the oscillator inverter.
CLKOUT	Output of the internal clock generator. The frequency of CLKOUT is 1/2 the oscillator frequency.
$\overline{\text{RESET}}$	Reset input to the chip.
BUSWIDTH	Input for buswidth selection. If CCR bit 1 is a one, this pin selects the bus width for the bus cycle in progress. If BUSWIDTH is a 1, a 16-bit bus cycle occurs. If BUSWIDTH is a 0 an 8-bit cycle occurs. If CCR bit 1 is a 0, the bus is always an 8-bit bus.
NMI	A positive transition causes a vector through 203EH.
INST	Output high during an external memory read indicates the read is an instruction fetch. INST is valid throughout the bus cycle. INST is activated only during external memory accesses and output low for a data fetch.
$\overline{\text{EA}}$	Input for memory select (External Access). $\overline{\text{EA}}$ equal to a TTL-high causes memory accesses to locations 2000H through 5FFFH to be directed to on-chip ROM/EPROM. $\overline{\text{EA}}$ equal to a TTL-low causes accesses to those locations to be directed to off-chip memory.
ALE/ $\overline{\text{ADV}}$	Address Latch Enable or Address Valid output, as selected by CCR. Both pin options provide a signal to demultiplex the address from the address/data bus. When the pin is $\overline{\text{ADV}}$, it goes inactive high at the end of the bus cycle. ALE/ $\overline{\text{ADV}}$ is activated only during external memory accesses.
$\overline{\text{RD}}$	Read signal output to external memory. $\overline{\text{RD}}$ is activated only during external memory reads.
$\overline{\text{WR}}$ / $\overline{\text{WRL}}$	Write and Write Low output to external memory, as selected by the CCR. $\overline{\text{WR}}$ will go low for every external write, while $\overline{\text{WRL}}$ will go low only for external writes where an even byte is being written. $\overline{\text{WR}}$ / $\overline{\text{WRL}}$ is activated only during external memory writes.
$\overline{\text{BHE}}$ / $\overline{\text{WRH}}$	Bus High Enable or Write High output to external memory, as selected by the CCR. $\overline{\text{BHE}} = 0$ selects the bank of memory that is connected to the high byte of the data bus. $\text{A0} = 0$ selects the bank of memory that is connected to the low byte of the data bus. Thus accesses to a 16-bit wide memory can be to the low byte only ($\text{A0} = 0$, $\overline{\text{BHE}} = 1$), to the high byte only ($\text{A0} = 1$, $\overline{\text{BHE}} = 0$), or both bytes ($\text{A0} = 0$, $\overline{\text{BHE}} = 0$). If the $\overline{\text{WRH}}$ function is selected, the pin will go low if the bus cycle is writing to an odd memory location. $\overline{\text{BHE}}$ / $\overline{\text{WRH}}$ is valid only during 16-bit external memory write cycles.

PIN DESCRIPTIONS (Continued)

Symbol	Name and Function
READY	Ready input to lengthen external memory cycles, for interfacing to slow or dynamic memory, or for bus sharing. When the external memory is not being used, READY has no effect.
HSI	Inputs to High Speed Input Unit. Four HSI pins are available: HSI.0, HSI.1, HSI.2 and HSI.3. Two of them (HSI.2 and HSI.3) are shared with the HSO Unit.
HSO	Outputs from High Speed Output Unit. Six HSO pins are available: HSO.0, HSO.1, HSO.2, HSI.3, HSO.4 and HSO.5. Two of them (HSO.4 and HSO.5) are shared with the HSI Unit.
Port 0	8-bit high impedance input-only port. These pins can be used as digital inputs and/or as analog inputs to the on-chip A/D converter.
Port 1	8-bit quasi-bidirectional I/O port.
Port 2	8-bit multi-functional port. All of its pins are shared with other functions in the 87C196KD.
Ports 3 and 4	8-bit bidirectional I/O ports with open drain outputs. These pins are shared with the multiplexed address/data bus.
$\overline{\text{HOLD}}$	Bus Hold input requesting control of the bus.
$\overline{\text{HLDA}}$	Bus Hold acknowledge output indicating release of the bus.
$\overline{\text{BREQ}}$	Bus Request output activated when the bus controller has a pending external memory cycle.

NOTES:

(Notes apply to all specifications)

1. QBD (Quasi-bidirectional) pins include Port 1, P2.6 and P2.7.

2. Standard Outputs include AD0-15, RD, WR, ALE, BHE, INST, HSO pins, PWM/P2.5, CLKOUT, RESET, Ports 3 and 4, TXD/P2.0 and RXD (in serial mode 0). The V_{OH} specification is not valid for RESET. Ports 3 and 4 are open-drain outputs.

3. Standard Inputs include HSI pins, READY, BUSWIDTH, NMI, RXD/P2.1, EXTINT/P2.2, T2CLK/P2.3 and T2RST/P2.4.

4. Maximum current per pin must be externally limited to the following values if V_{OL} is held above 0.45V or V_{OH} is held below $V_{CC} - 0.7V$: I_{OL} on Output pins: 10 mA I_{OH} on quasi-bidirectional pins: self limiting I_{OH} on Standard Output pins: 10 mA5. Maximum current per bus pin (data and control) during normal operation is ± 3.2 mA.

6. During normal (non-transient) conditions the following total current limits apply:

Port 1, P2.6	I_{OL} : 29 mA	I_{OH} is self limiting
HSO, P2.0, RXD, RESET	I_{OL} : 29 mA	I_{OH} : 26 mA
P2.5, P2.7, WR, BHE	I_{OL} : 13 mA	I_{OH} : 11 mA
AD0-AD15	I_{OL} : 52 mA	I_{OH} : 52 mA
RD, ALE, INST-CLKOUT	I_{OL} : 13 mA	I_{OH} : 13 mA

T _{XLXX}	Low Time	22		ns
T _{XLXH}	Rise Time		10	ns
T _{XHXL}	Fall Time		10	ns

EXTERNAL CLOCK DRIVE WAVEFORMS

An external oscillator may encounter as much as a 100 pF load at XTAL1 when it starts-up. This is due to interaction between the amplifier and its feedback capacitance. Once the external signal meets the V_{IL} and V_{IH} specifications the capacitance will not exceed 20 pF.

AC TESTING INPUT, OUTPUT WAVEFORMS

AC Testing inputs are driven at 2.4V for a Logic "1" and 0.45V for a Logic "0". Timing measurements are made at 2.0V for a Logic "1" and 0.8V for a Logic "0".

FLOAT WAVEFORMS

For timing purposes a port pin is no longer floating when a 100 mV change from load voltage occurs and begins to float when a 100 mV change from the loaded V_{OH}/V_{OL} level occurs I_{OL}/I_{OH} = ±15 mA.

EXPLANATION OF AC SYMBOLS

Each symbol is two pairs of letters prefixed by "T" for time. The characters in a pair indicate a signal and its condition, respectively. Symbols represent the time between the two signal/condition points.

Conditions:

- H— High
- L— Low
- V— Valid
- X— No Longer Valid
- Z— Floating

Signals:

- A— Address
- B— $\overline{\text{BHE}}$

NOTES:

- Run Time Programming is done with $F_{OSC} = 6.0\text{ MHz to }12.0\text{ MHz}$, $V_{REF} = 5\text{V} \pm 0.50\text{V}$, $T_A = +25^{\circ}\text{C to } \pm 5^{\circ}\text{C}$ and $V_{PP} = 12.50\text{V}$. For run-time programming over a full operating range, contact the factory.
- This specification is for the Word Dump Mode. For programming pulses, use $300 T_{OSC} + 100 \mu\text{s}$.

DC EPROM Programming Characteristics

Symbol	Description	Min	Max	Units
I_{PP}	V_{PP} Supply Current (When Programming)		100	mA

NOTE:

V_{PP} must be within 1V of V_{CC} while $V_{CC} < 4.5\text{V}$. V_{PP} must not have a low impedance path to ground of V_{SS} while $V_{CC} > 4.5\text{V}$.

10-BIT A/D CHARACTERISTICS

The speed of the A/D converter in the 10-bit mode can be adjusted by setting a clock prescaler on or off. At high frequencies more time is needed for the comparator to settle. The maximum frequency with the clock prescaler disabled is 6 MHz. The conversion times with the prescaler turned on or off is shown in the table below. The AD_TIME register has not been characterized for the 10-bit mode.

The converter is ratiometric, so the absolute accuracy is dependent on the accuracy and stability

of V_{REF} . V_{REF} must be close to V_{CC} since it supplies both the resistor ladder and the digital section of the converter.

A/D CONVERTER SPECIFICATIONS

The specifications given below assume adherence to the Operating Conditions section of this data-sheet. Testing is performed with $V_{REF} = 5.12V$.

2. Multiplexer Break-Before-Make Guaranteed.

3. Typical values are expected for most devices at 25°C.

8-BIT MODE A/D CHARACTERISTICS

The 8-bit mode trades off resolution for a faster conversion time. The AD_TIME register must be used when performing an 8-bit conversion.

The following specifications are tested @ 16 MHz with 0A6H in AD_TIME. The actual AD_TIME register is tested with all possible values, to ensure functionality, but the accuracy of the A/D converter is not.

Sample Time 20 States	Convert Time 56 States
A6H in AD_TIME 9.8 μ s @ 16 MHz

1. Typical values are expected for most devices at 25°C.

8XC196KB TO 87C196KD DESIGN CONSIDERATIONS

1. Memory Map. The 87C196KD has 512 bytes of RAM/SFRs and 32K of ROM/EPROM. The extra 256 bytes of RAM will reside in locations 100H–1FFH and the extra 24K of EPROM will reside in locations 4000H–9FFFH. These locations are external memory on the 87C196KB.
2. The CDE pin on the KB has become a V_{SS} pin on the KC to support 16 MHz operation.
3. EPROM programming. The 87C196KD has a different programming algorithm to support 32K of on-board memory. When performing Run-Time Programming, use the section of code on page 99 of the 80C196KC User's Guide, Order Number 270704.

4. ONCE Mode Entry. The ONCE mode is entered on the 87C196KD by driving the TXD pin low on the rising edge of RESET. The TXD pin is held high by a pullup that is specified at 1.4 mA and remain at 2.0V. This Pullup must not be overridden or the 87C196KD will enter the ONCE mode.
5. During the bus HOLD state, the 87C196KD weakly holds RD, WR, ALE, BHE and INST in their inactive states. The 87C196KB only holds ALE in its inactive state.
6. A RESET pulse from the 87C196KD is 16 states rather than 4 states as on the 87C196KB (i.e., a watchdog timer overflow). This provides a longer RESET pulse for other devices in the system.

8XC196KD ERRATA

1. It is possible for the device to fail to recognize an interrupt on EXTINIT, for both P2.2 and P0.7, and NMI. The problem is most likely to occur on P0.7 while the device is operating at low voltage (<4.7V), high frequency (16 MHz) and high temperature (>85°C). There is a window of about 2 ns near clockout falling during which these interrupts may be missed.

2. In Mode 0, the serial port does not work if the highest baud rate is selected (SP__BAUD = 8001h). Data shifted into the device will not be correctly read at this baud rate.

DATASHEET REVISION HISTORY

The following are the key differences between this datasheet and the -005 version:

1. The “preliminary” status was dropped and replaced with production status (no label).
Trademarks were updated.
