

3-WIRE REAL-TIME CLOCK

S-35190A

The S-35190A is a low-current-consumption 3-wire CMOS real-time clock IC that features a wide operating voltage range (1.3 V to 5.5 V) and can be driven on a variety of supply voltages, from a main supply to a backup supply. The time keeping current consumption of 0.25 μ A and minimum time keeping operation voltage of 1.1 V enable greatly increased battery duration.

In a system that operates on a backup battery, the free register incorporated in the real-time clock can be used for the user backup memory function. The user register can hold data on a supply voltage as low as 1.2 V (min.), so the data stored in the register before the main power supply was cut can be called any time after the voltage is restored.

This product also includes a clock adjustment function that enables wide-ranging correction of deviation in the frequency of the crystal oscillator at a minimum resolution of 1 ppm. Also, by combining this function with a temperature sensor, the clock adjustment value can be set in accordance with changes in the temperature, which makes it possible to realize a clock function that retains a high degree of accuracy regardless of temperature variation.

■ Features

- Low current consumption: 0.25 μ A typ. ($V_{DD} = 3.0$ V, $T_a = 25^\circ\text{C}$)
- Wide operating voltage range: 1.3 to 5.5 V
- Minimum time keeping operation voltage: 1.1 V
- Built-in clock adjustment function
- Built-in free user register
- 3-wire (micro wire) CPU interface
- Built-in alarm interrupter
- Built-in flag generator at power down or power on
- Auto calendar up to the year 2099, automatic leap year calculation function
- Built-in constant voltage circuit
- Built-in 32 kHz crystal oscillator circuit (C_d built in, C_g external)
- Package: 8-pin SOP (JEDEC), 8-pin TSSOP, SNT-8A

■ Applications

- Digital still cameras
- Digital video cameras
- Electronic voltmeters
- DVD recorders
- TVs, VCRs
- PHS
- Mobile phones
- Car navigation

■ Packages

| Package Name | Drawing Code | | |
|------------------|--------------|---------|---------|
| | Package | Tape | Reel |
| 8-Pin SOP(JEDEC) | FJ008-A | FJ008-D | FJ008-D |
| 8-Pin TSSOP | FT008-A | FT008-E | FT008-E |
| SNT-8A | PH008-A | PH008-A | PH008-A |

■ Description of Pins

Table 1

| Pin No. | Symbol | Description | Configuration |
|---------|-------------------------|---|--|
| 1 | $\overline{\text{INT}}$ | Interrupt signal output pin Depending on the mode set by INT1 register_1 and the status register, it outputs low or a clock when the time is reached. It is disabled by rewriting the status register. | Nch open-drain output (no protective diode on the side of VDD) |
| 2 | XOUT | Crystal oscillator connect pin (32,768 Hz) | — |
| 3 | XIN | (C _d built in, C _g external) | |
| 4 | VSS | Negative power supply pin (GND) | — |
| 5 | CS | Chip select input pin During “H”: The SIO pin allows data I/O. The SCK pin allows data input. During “L”: The SIO pin is in the Hi-Z state. The SCK pin is in the input-disabled state. | CMOS input (built-in pull-down resistance. No protective diode on the side of VDD) |
| 6 | $\overline{\text{SCK}}$ | Serial clock input pin Data I/O from the SIO pin is performed in synchronization with this clock. However, clock input is not accepted while the CS pin is “L.” | CMOS input (no protective diode on the side of VDD) |
| 7 | SIO | Serial data I/O pin It is normally in the Hi-Z state while the CS pin is “L.” When the CS pin changes from “L” to “H,” the SIO pin is set to an input pin. It will then be set to an input or output pin, depending on the subsequently input command. | Nch open-drain output (no protective diode on the side of VDD) CMOS input |
| 8 | VDD | Positive power supply pin | — |

■ Absolute Maximum Ratings

Table 2

| Parameter | Symbol | Applicable Pin | Rating | Unit |
|-----------------------|-----------|----------------------------|----------------------------------|------|
| Power supply voltage | V_{DD} | — | $V_{SS} - 0.3$ to $V_{SS} + 6.5$ | V |
| Input voltage | V_{IN} | \overline{SCK} , SIO, CS | $V_{SS} - 0.3$ to $V_{SS} + 6.5$ | V |
| Output voltage | V_{OUT} | SIO, \overline{INT} | $V_{SS} - 0.3$ to $V_{SS} + 6.5$ | V |
| Operating temperature | T_{opr} | — | -40 to +85 | °C |
| Storage temperature | T_{stg} | — | -55 to +125 | °C |

Caution The absolute maximum ratings are rated values exceeding which the product could suffer physical damage. These values must therefore not be exceeded under any conditions.

■ Recommended Operating Conditions

Table 3

| Parameter | Symbol | Conditions | Min. | Typ. | Max. | Unit |
|------------------------------------|------------|------------------------------------|-------------------|------|------|------|
| Power supply voltage | V_{DD} | $T_a = -40$ to $+85^\circ\text{C}$ | 1.3 | 3.0 | 5.5 | V |
| Operating temperature | T_{opr} | $V_{DD} = 1.3$ to 5.5 V | -40 | +25 | +85 | °C |
| Time keeping voltage range | V_{DDT} | $T_a = -40$ to $+85^\circ\text{C}$ | V_{DDTm} | — | 5.5 | V |
| Register hold voltage | V_{DH} | $T_a = -40$ to $+85^\circ\text{C}$ | V_{DDTm} | — | 5.5 | V |
| Minimum time keeping voltage range | V_{DDTm} | $T_a = -40$ to $+85^\circ\text{C}$ | 0.5 ^{*1} | — | 1.1 | V |
| Crystal oscillator C_L value | C_L | — | — | — | 7.0 | pF |

*1. Reference value

■ Oscillation Characteristics

Table 4

($T_a = 25^\circ\text{C}$, $V_{DD} = 3.0$ V, DS-VT-200 crystal oscillator ($C_L = 6$ pF, 32,768 Hz) manufactured by Seiko Instruments Inc.)

| Parameter | Symbol | Conditions | Min. | Typ. | Max. | Unit |
|--|-------------|---------------------------|------|------|------|-------|
| Oscillation start voltage | V_{STA} | Within 10 seconds | 1.1 | — | 5.5 | V |
| Oscillation start time | t_{STA} | $V_{DD} = 3.0$ V | — | — | 1 | s |
| IC-to-IC frequency deviation ^{*1} | δIC | — | -10 | — | +10 | ppm |
| Frequency voltage deviation | δV | $V_{DD} = 1.3$ to 5.5 V | -3 | — | +3 | ppm/V |
| Internal oscillation capacitance (1) | C_g | Applied to XIN pin | 0 | — | 9.1 | pF |
| Internal oscillation capacitance (2) | C_d | Applied to XOUT pin | — | 8 | — | pF |

■ AC Electrical Characteristics

Table 7 Measurement Conditions

| | |
|------------------------------|---|
| Input pulse voltage | $0.2 \times V_{CC}$ to $0.8 \times V_{CC}$ |
| Input pulse rise/fall time | 20 ns |
| Output determination voltage | $V_{OH} = 0.8 \times V_{CC}$, $V_{OL} = 0.2 \times V_{CC}$ |
| Output load | 80 pF + pull-up resistor 10 k Ω |

Figure 5 Output Load Circuit

Table 8 AC Characteristics

($T_a = -40$ to $+85^\circ\text{C}$)

| Parameter | Symbol | $V_{DD} = 1.3$ to 3.0 V ($V_{CC} = 3.0\text{ V}$) | | | $V_{DD} = 3.0$ to 5.5 V ($V_{CC} = 5.5\text{ V}$) | | | Unit |
|---|------------|--|------|--------|--|------|--------|---------------|
| | | Min. | Typ. | Max. | Min. | Typ. | Max. | |
| Clock pulse width | t_{SCK} | 5 | — | 250000 | 1 | — | 250000 | μs |
| Setup time before CS rise | t_{DS} | 1 | — | — | 0.2 | — | — | μs |
| Hold time after CS rise | t_{CSH} | 1 | — | — | 0.2 | — | — | μs |
| Input data setup time | t_{ISU} | 1 | — | — | 0.2 | — | — | μs |
| Input data hold time | t_{IHO} | 1 | — | — | 0.2 | — | — | μs |
| Output data definition time ^{*1} | t_{ACC} | — | — | 3.5 | — | — | 1 | μs |
| Setup time before CS fall | t_{CSS} | 1 | — | — | 0.2 | — | — | μs |
| Hold time after CS fall | t_{DH} | 1 | — | — | 0.2 | — | — | μs |
| Input rise/fall time | t_R, t_F | — | — | 0.1 | — | — | 0.05 | μs |

^{*1}. Since the output format of the SIO pin is Nch open-drain output, output data definition time is determined by the values of the load resistance (R_L) and load capacity (C_L) outside the IC. Therefore, use this value only as a reference value.

■ Timing Chart

Figure 6 AC Characteristics 1

Figure 7 AC Characteristics 2

Figure 8 AC Characteristics 3

■ Operation

1. Communication data configuration

After making the CS pin “H”, transmit the 4-bit fixed code “0110” and then transmit a 3-bit command followed by a 1-bit read/write command. Refer to “**Serial Interface**”.

Figure 9 Communication Data

2. Command configuration

There are eight types of commands that read from and write to various registers. The table below lists these commands.

Table 9 Command List

| Command | | | | Data | | | | | | | |
|---------|----|----|---|--------------------|--|--------------------|--------------------|-------------------|-------------------|--------|---------------------|
| C2 | C1 | C0 | Description | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| 0 | 0 | 0 | Status register_1 access | POC ^{*4} | BLD ^{*4} | INT2 ^{*3} | INT1 ^{*3} | SC1 ^{*2} | SC0 ^{*2} | 12/24 | RESET ^{*1} |
| 0 | 0 | 1 | Status register_2 access | TEST ^{*5} | INT2AE | SC ^{*7} | SC ^{*7} | 32kE | INT1AE | INT1ME | INT1FE |
| 0 | 1 | 0 | Real-time data 1 access (year data to) | Y80 | Y40 | Y20 | Y10 | Y8 | Y4 | Y2 | Y1 |
| | | | | — ^{*6} | — ^{*6} | — ^{*6} | M10 | M8 | M4 | M2 | M1 |

| 1 | 1 | 0 | Clock adjustment register access | V7 | V6 | V5 | V4 | V3 | V2 | V1 | V0 |
| 1 | 1 | 1 | Free register access | F7 | F6 | F5 | F4 | F3 | F2 | F1 | F0 |

^{*1.} Write-only flag. By writing “1” to this register, the IC is reset.

^{*2.} Scratch bit. R/W-enabled register that can be freely used by users.

^{*3.} Read-only flag. It is cleared when read. It is valid only when the alarm is set.

^{*4.} Read-only flag. “POC” is set to “1” when power is applied. It is cleared when read. For the “BLD”, refer to “**Power Supply Voltage Detector**.”

^{*5.} For IC testing. Normally set this register to “0”.

^{*6.} No effect by writing. It is “0” when read.

^{*7.} This is a R/W-enabled register that does not affect interrupts.

■ Register Configuration

1. Real-time data register

The real-time data register is a 56-bit register that stores the BCD code of the year, month, day, day of week, hour, minute, and second data. Any read/write operation performed by the real-time data access command transmits or receives the data from the LSB which is the first digit of the year.

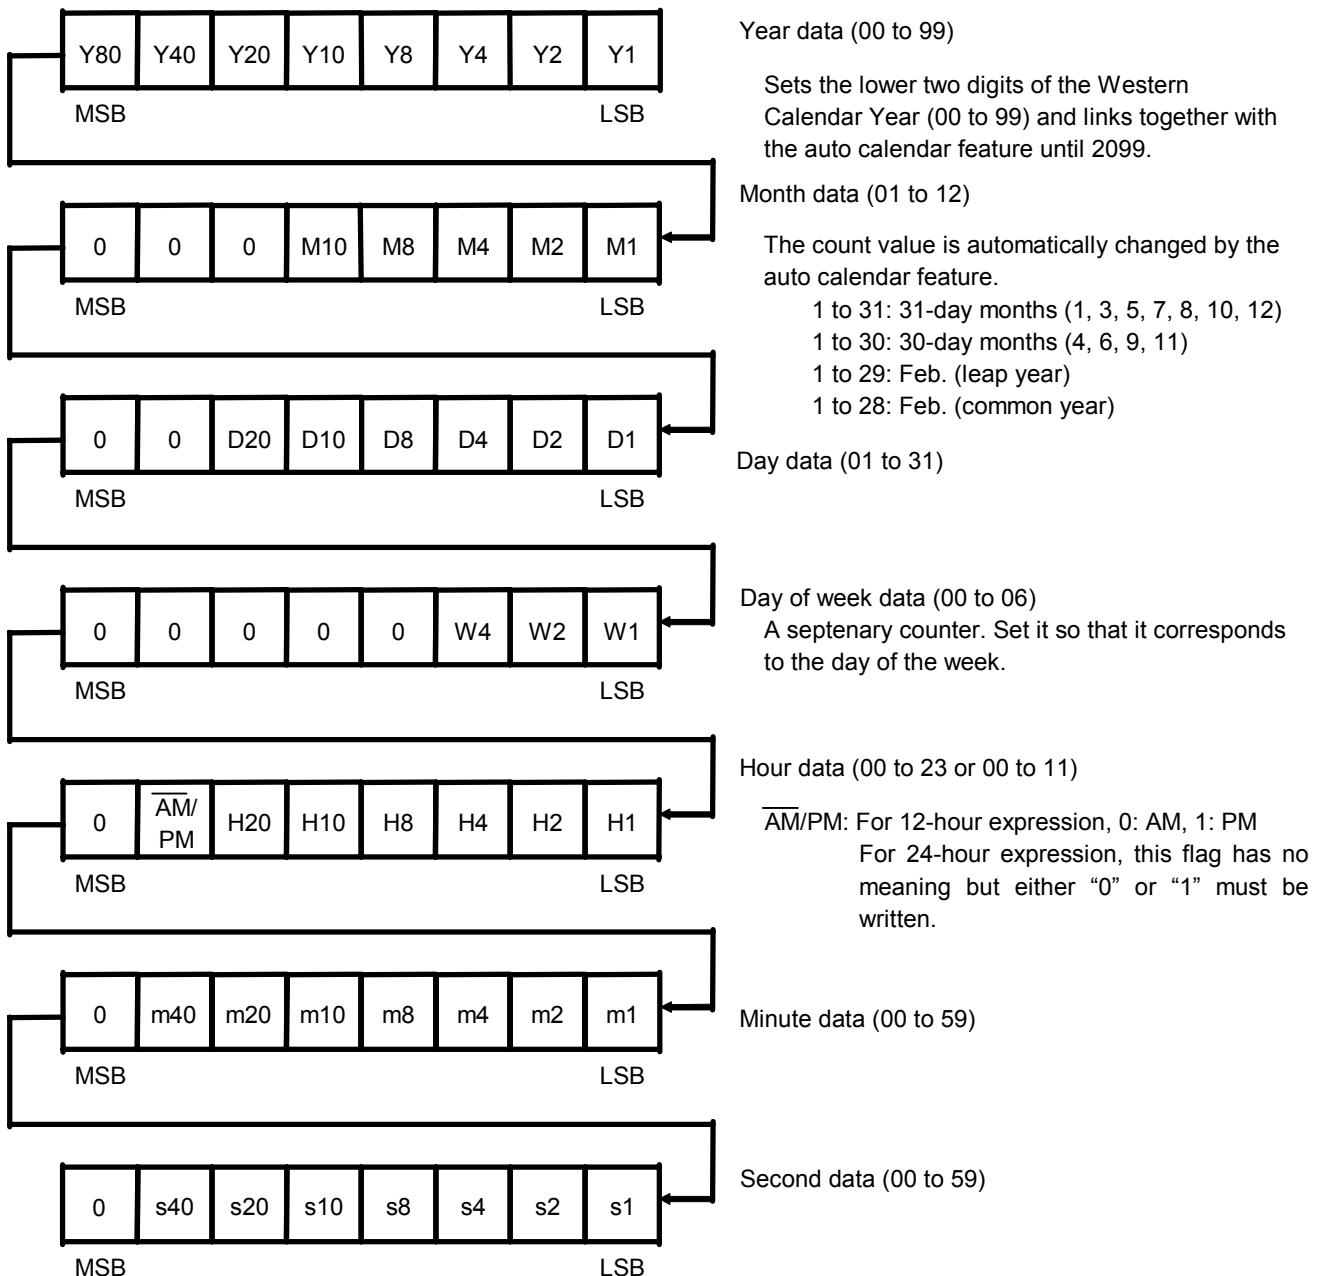

Figure 10 Real-time Data Register

2. Status register_1

Status register_1 is an 8-bit register that is used to display and set various modes. The bit configuration is shown below.

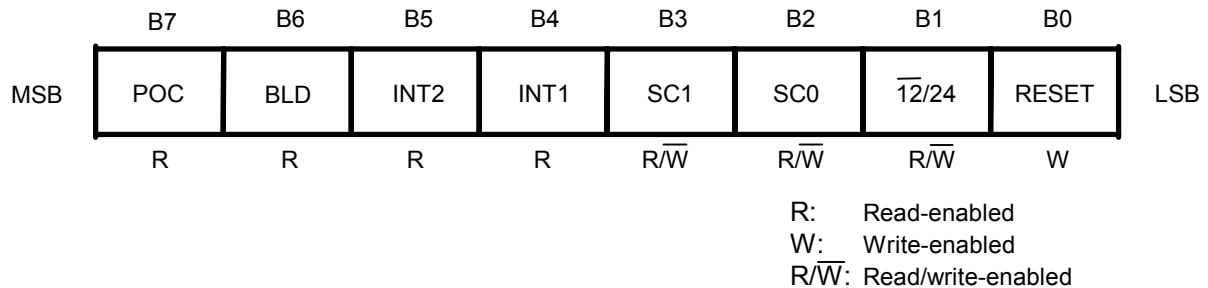

Figure 11 Status Register_1

- B7: POC** This flag is set to “1” at power-on. Once this flag is set to “1”, it is not set to “0” even when the power supply voltage reaches or exceeds the detection voltage (V_{DET}). This flag is read-only and can be read by the status register_1 access command. Once it is read, it is automatically set to “0”. When the flag is “1”, it must be initialized. For the method of initialization, refer to “**Initialization at Power-on and Power-on Detector**”.
- B6: BLD** If the power supply voltage detector detects a voltage of detection voltage (V_{DET}) or less this flag is set to “1”, which enables the detection of a power supply voltage drop. Once this flag is set to “1”, it is not set to “0” even when the power supply voltage reaches or exceeds the detection voltage (V_{DET}). This flag is read-only and can be read by the status register_1 access command. Once it is read, it is automatically set to “0”. When the flag is “1”, it must be initialized. For the method of initialization, refer to “**Initialization at Power-on and Power-on Detector**”. and for the operation of the power supply voltage detector, refer to “**Power Supply Voltage Detector**”.
- B5, B4: INT2, INT1**
- When the interrupt signal is output from the \overline{INT} pin using the alarm interrupt function, for an interrupt set by INT1, the INT1 flag is set to “1”, and for an interrupt set by INT2, the INT2 flag is set to “1”.
- B3, B2: SC1, SC0**
- These flags configure a 2-bit SRAM type register that can be freely set by users. They are read and written within the operating voltage range (1.3 to 5.5 V).
- B1: $\overline{12/24}$** This flag is used to set 12-hour or 24-hour expression.
- 0: 12-hour expression
1: 24-hour expression
- B0: RESET** By setting this bit to “1”, the internal IC is initialized. This is a write-only bit and is always “0” when it is read. Be sure to write “1” to the reset flag when applying the power supply voltage to the IC.

3. Status Register_2

Status register_2 is an 8-bit register that is used to display and set various modes. The bit configuration is shown below.

Figure 12 Status Register_2

B7: TEST The TEST flag is a bit for testing the IC. If the TEST flag is set to “1”, the IC is switched to the TEST mode. If this flag is “1”, it is necessary to initialize it to “0” by setting the reset flag of status register_1 to “1”.

B6: INT2AE This flag is used to choose the state of $\overline{\text{INT}}$ pin output with alarm interrupt output set. When using the alarm 2 function, enable this flag and access INT1 register_2.

0: Alarm interrupt output is disabled.

1: Alarm interrupt output is enabled.

Caution Note that an alarm 2 interrupt is output from the $\overline{\text{INT}}$ pin regardless of the settings of flags B3 to B1.

B5, B4: SC These flags configure a 2-bit SRAM type register that can be freely set by users. They are read and written within the operating voltage range (1.3 to 5.5 V).

B3: 32kE, B2: INT1AE, B1: INT1ME, B0: INT1FE

These flags are used to select the output mode from the $\overline{\text{INT}}$ pin. Mode selections are shown below. When using the alarm 1 function, after setting the alarm interrupt mode, access INT1 register_1.

Table 10 Interrupt Modes

| 32kE | INT1AE | INT1ME | INT1FE | $\overline{\text{INT}}$ Pin Output Mode |
|------|--------|--------|--------|--|
| 0 | 0 | 0 | 0 | No interrupt |
| 1 | *1 | *1 | *1 | 32 kHz output |
| 0 | *1 | 0 | 1 | Selected frequency steady interrupt |
| 0 | *1 | 1 | 0 | Per-minute edge interrupt |
| 0 | 0 | 1 | 1 | Per-minute steady interrupt 1 (50% duty) |
| 0 | 1 | 0 | 0 | Alarm interrupt |
| 0 | 1 | 1 | 1 | Per-minute steady interrupt 2 |

*1. Don't care (Both of 0 and 1 are acceptable).

4. INT1 register_1 and INT1 register_2

INT1 register_1 and INT1 register_2 are interrupt setting registers that can be set independently. The interrupt is output from the $\overline{\text{INT}}$ pin under the OR condition of the two registers. INT1 register_1 allows setting the alarm time or frequency duty. INT1 register_2 allows setting the alarm time. The function is switched by using status register_2.

(1) Alarm interrupt

Data set in INT1 register_1 and INT1 register_2 is considered as alarm time data. Having the same configuration as the hour and minute registers of the real-time data register, these registers represent hours and minutes with BCD codes. When setting these registers, do not set any nonexistent day. Data to be set must be in accordance with the 12-hour or 24-hour expression that is set in status register_1.

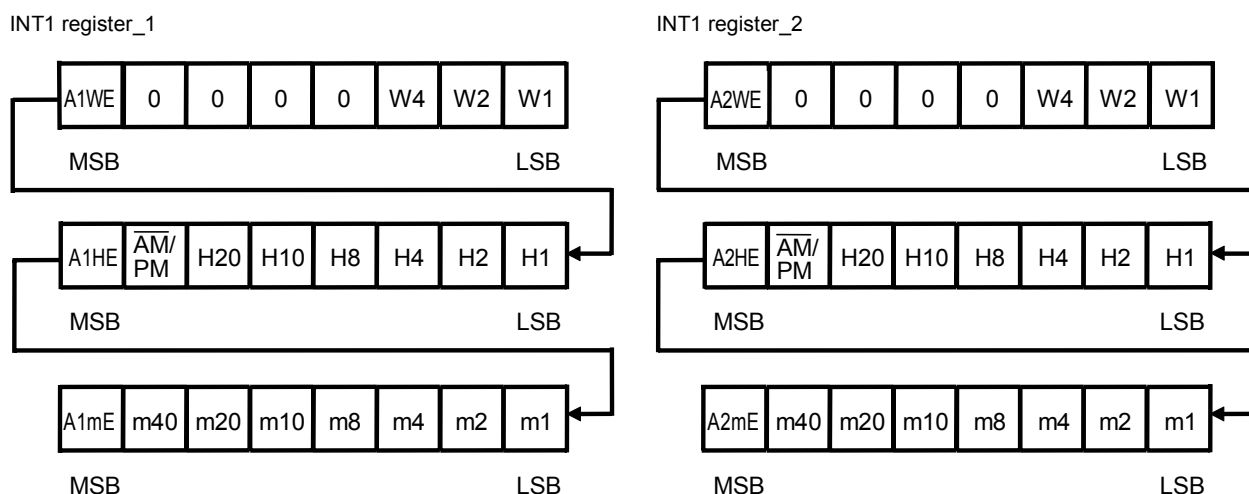

Figure 13 INT1 Register_1, INT1 Register_2 (Alarm Time Data)

In INT1 register_1, A1WE, A1HE, and A1mE are respectively in the MSB of each byte. By setting each bit to "1", the setting of the day of week data, hour data, and minute data in the corresponding byte becomes valid. A2WE, A2HE, and A2mE of INT1 register_2 are the same.

The example of setting In case of the setting alarm time "PM 7:00" in INT1 register_1

(1) 12-hour expression (status register_1 B1 = 0)

: set up 7:00 PM

Writing in INT1 register_1

| | | | | | | | | |
|------------------|-----|-----|-----|-----|-----|-----|-----|-----|
| Day of week data | 0 | —*1 | —*1 | —*1 | —*1 | —*1 | —*1 | —*1 |
| Hour data | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 1 |
| Minute data | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | MSB | | | | | | | LSB |

*1. Don't care (Both of 0 and 1 are acceptable).

(2) 24-hour expression (status register_1 B1 = 1)

: set up 19:00 PM

Writing in INT1 register_1

| | | | | | | | | |
|------------------|-----|-----|-----|-----|-----|-----|-----|-----|
| Day of week data | 0 | —*1 | —*1 | —*1 | —*1 | —*1 | —*1 | —*1 |
| Hour data | 1 | 1*2 | 0 | 1 | 1 | 0 | 0 | 1 |
| Minute data | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | MSB | | | | | | | LSB |

*1. Don't care (Both of 0 and 1 are acceptable).

*2. Set up $\overline{\text{AM/PM}}$ flag along with the time setting.

(2) Selected frequency steady interrupt

Data set in INT1 register_1 is considered as frequency duty data. By setting each bit from B4 to B0 of the register to "1", the frequency corresponding to each bit is selected in an ANDed form. The SC bits configure a 3-bit SRAM type register that can be set freely by users. These bits can be read and written within the operating voltage range (1.3 to 5.5 V). There is no impact on the duty function.

Figure 14 INT1 Register_1 (Frequency Duty Data)

Example B4 to B0 = 0Ah

Figure 15 INT1 Register_1 (Frequency Duty Data) Output Example

5. Clock adjustment register

The clock adjustment register is a 1-byte register that is used to logically correct real-time data. When not using the clock adjustment register, set this register to 00h using the clock adjustment register write command.

For the “register value”, refer to “**Clock Adjustment Function**”.

Figure 16 Clock Adjustment Register

6. Free register

The free register is a 1-byte SRAM type register that can be set freely by users. It can be read and written within the operating voltage range (1.3 to 5.5 V).

Figure 17 Free Register

■ Initialization at Power-on and Power-on Detector

When power is applied to this IC, status register_1 is set to "80h" (bit 7 (POC flag) of status register_1 is set to "1") by the power-on detector and a 1 Hz clock is output from the $\overline{\text{INT}}$ pin. This function is provided to adjust the oscillation frequency. In normal use, the IC must be initialized at power-on. Initialization is performed by writing "1" to bit 0 (RESET flag) of status register_1.

Also, the IC must be initialized when the POC flag is set to "1". After initialization, the POC flag is set to "0". For normal operation of the power-on detector, first hold the IC power supply voltage at 0 V and then increase it.

■ Register State After Initialization

The state of each register after initialization is as follows.

| | |
|----------------------------|---|
| Real-time data register: | 00 (year), 01 (month), 01 (day), 0 (day of week), 00 (hour), 00 (minute), 00 (second) |
| Status register_1: | "0h***0b" (B3, B2, and B1 are user setting data.) |
| Status register_2: | "00h" |
| INT1 register_1: | "00h" |
| INT1 register_2: | "00h" |
| Clock adjustment register: | "00h" |
| Free register: | "00h" |

■ Power Supply Voltage Detector

S-35190A has an internal power supply voltage detector, which monitors drops in the power supply voltage by reading the BLD flag. This circuit samples the voltage for only 15.6 ms per second. If the power supply voltage drops below the detection voltage (V_{DET}), the BLD latch circuit latches the “H” level, bit 6 (BLD flag) of internal status register_1 is set to “1”, and sampling stops. Detection voltage and release voltage have approximate 0.15V (Typ.) of hysteresis width respectively (Refer to “**Characteristics**”). Once “1” is detected in the BLD flag, no detection operation is performed unless initialization is performed or the BLD flag is read by the status register_1 access command, and “1” is held in the BLD flag. Sampling resumes only when the subsequent communication action is initialization or BLD flag read.

In addition, if this BLD flag is “1” after the power supply voltage is recovered, it must be initialized.

Caution In case the power supply voltage falls and returns after the latch circuit latches “H”, the BLD flag can be read as “1” by a status register_1 access command first. After that the sampling is resumed and the read-out of the next BLD flag is performed, the BLD flag is reset and read as “0”. Refer to the timing chart below.

Figure 18 Timing of Power Supply Voltage Detector

■ Processing of Nonexistent Data and End-of-Month

When real-time data is written, the data is checked for validity, invalid data is processed, and the end-of-month is corrected.

[Processing of nonexistent data]

Table 11 Processing of Nonexistent Data

| Register | Normal Data | Error Data | Result |
|-----------------------------------|----------------------|----------------------------|--------|
| Year data | 00 to 99 | XA to XF, AX to FX | 00 |
| Month data | 01 to 12 | 00, 13 to 19, XA to XF | 01 |
| Day data | 01 to 31 | 00, 32 to 39, XA to XF | 01 |
| Day of week data | 0 to 6 | 7 | 0 |
| Hour data ^{*1} (24-hour) | 0 to 23 | 24 to 29, 3X, XA to XF | 00 |
| | (12-hour) 0 to 11 | 12 to 19, 2X, 3X, XA to XF | 00 |
| Minute data | 00 to 59 | 60 to 79, XA to XF | 00 |
| Second data ^{*2} | 00 to 59 | 60 to 79, XA to XF | 00 |

***1.** For 12-hour expression, write the $\overline{\text{AM/PM}}$ flag.

The AM/PM flag is ignored in 24-hour expression, but “0” for 0 to 11 hours and “1” for 12 to 23 hours are read in a read operation.

***2.** Processing of nonexistent data for second data is performed by a carry pulse one second after the end of writing. At this point, the carry pulse is sent to the minute counter.

[Processing of end-of-month]

A nonexistent day is set to the first day of the next month. If February 30th is written, March 1st is set. Leap year correction is also performed at this time.

■ Interrupts

The $\overline{\text{INT}}$ pin output mode is selected by the INT2AE, INT1AE, INT1ME, and INT1FE flags of status register_2. Note that when INT2AE is enabled, if the alarm 2 interrupt occurs, low is output from the $\overline{\text{INT}}$ pin regardless of the settings of the INT1AE, INT1ME, and INT1FE flags.

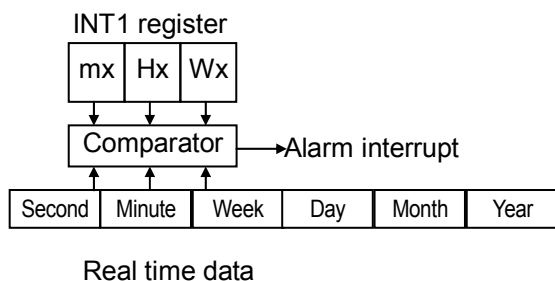

(1) Alarm interrupt output

When the $\overline{\text{INT}}$ pin output mode is set as the alarm setting using status register_2 and the day of week, hour, and minute data is set in INT1 register_1 (or INT1 register_2), low is output from the $\overline{\text{INT}}$ pin when the set hour is reached. Since the output is held, rewrite INT1AE of status register_2 to "0" (or INT2AE to "0") using serial communication to set the output to high (OFF state).

32kE = 0, INT1ME = INT1FE = 0

Alarm enable flag

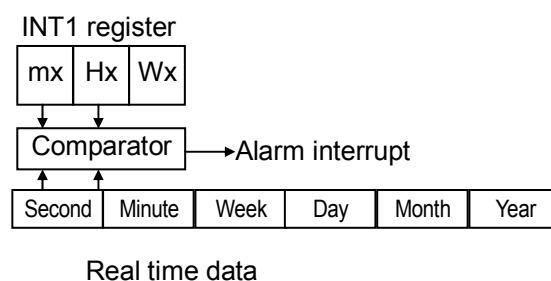

In case of AxWE = AxHE = AxmE = "1"

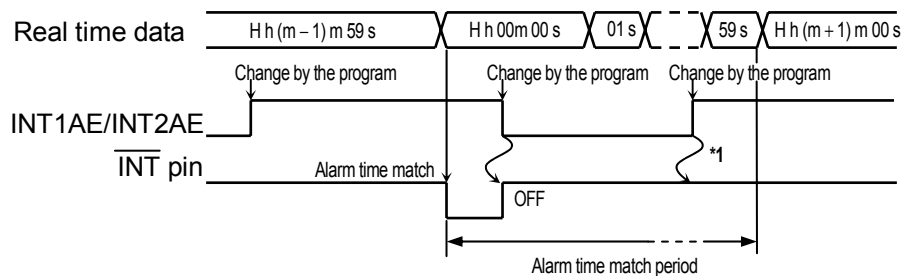

32kE = 0, INT1ME = INT1FE = 0

Alarm enable flag

In case of AxWE = "0", AxHE = AxmE = "1"

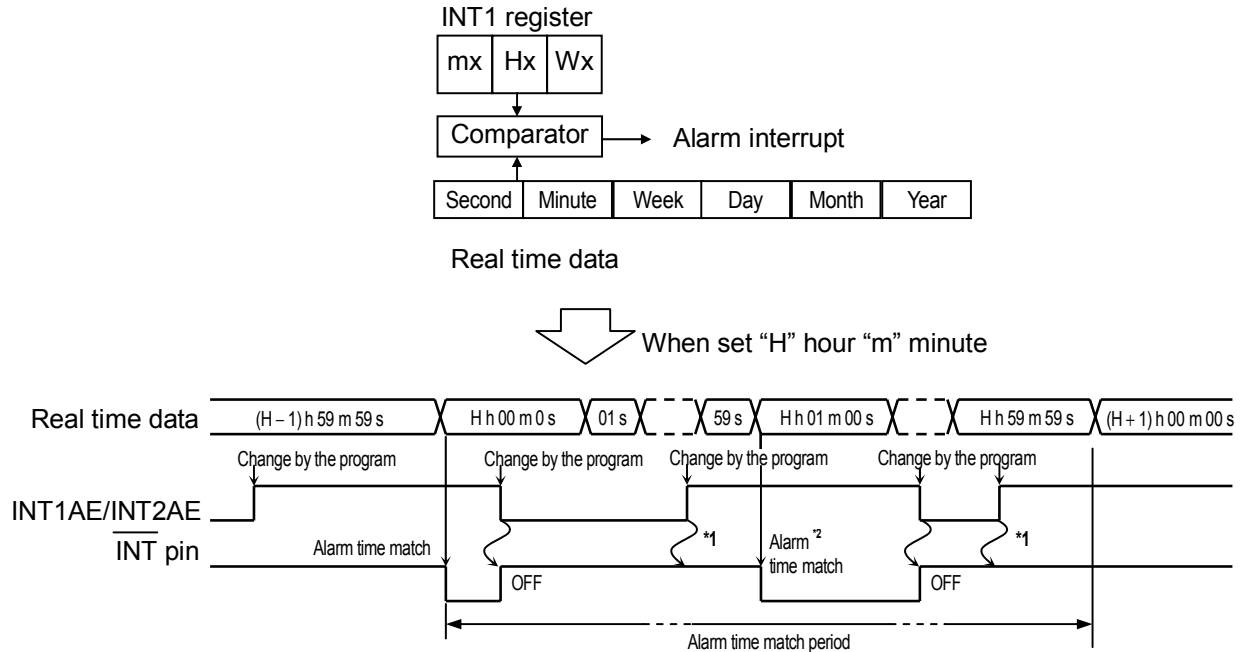

When set "H" Hour "m" minute

32kE = 0, INTME = INTFE = 0

Alarm enable flag

In case of AxWE = AxmE = "0", AxHE = "1"

- *1. Once it clears, even if it enables again within a coincidence period, "L" will not be output from an INT pin.
- *2. When an alarm output is turned on by change by the program within a coincidence period, "L" is again output from an INT pin at the time of change of the following part.

Figure 19 Timing of Alarm Interrupt Output

(2) Selected frequency steady interrupt output

When the INT pin output mode is set as the selected frequency steady interrupt setting using status register_2 and the frequency/duty data is set in INT1 register_1, the set clock is output.

32kE = 0, INT1AE = Don't care (0 or 1), INT1ME = 0

Figure 20 Timing of Selected Frequency Steady Interrupt Output

(3) Per-minute edge interrupt output

When the first minute carry is performed after the $\overline{\text{INT}}$ pin output mode is set as the per-minute edge interrupt using status register_2, low is output from the $\overline{\text{INT}}$ pin. Since the output is held, rewrite 32kE, INT1AE, INT1ME, and INT1FE of status register_2 to "0" using serial communication to set the output to high (OFF state).

32kE = 0, INT1AE = Don't care (0 or 1), INT1FE = 0

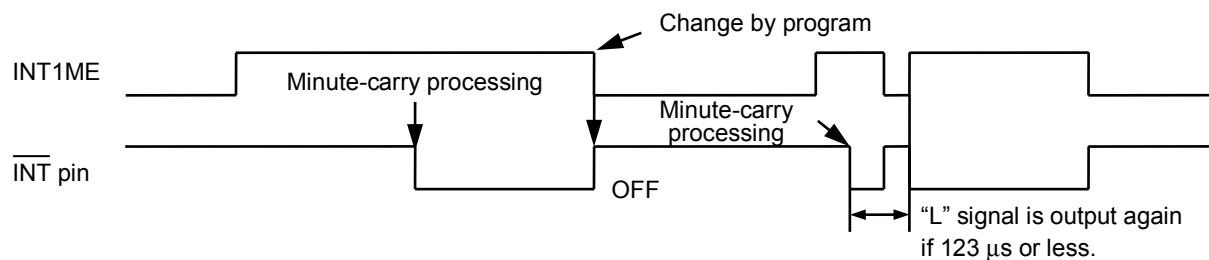

Figure 21 Timing of Per-Minute Edge Interrupt Output

Caution Since the minute carry processing signal is retained for 123 μ s, if communication disable or enable is executed during this period, low is output from the $\overline{\text{INT}}$ pin again.

(4) Per-minute steady interrupt output 1

When the first minute carry is performed after the $\overline{\text{INT}}$ pin output mode is set as per-minute steady interrupt 1 using status register_2, a clock whose cycle is 1 minute (50% duty) is output from the $\overline{\text{INT}}$ pin.

32kE = 0, INT1AE = 0

Figure 22 Timing of Per-Minute Steady Interrupt Output 1

Caution When communication disable or enable is executed while the $\overline{\text{INT}}$ pin is low, low is output from the $\overline{\text{INT}}$ pin again.

(5) Per-minute steady interrupt output 2

When the first minute carry is performed after the $\overline{\text{INT}}$ pin output mode is set as per-minute steady interrupt 2 using status register_2, low is output from the $\overline{\text{INT}}$ pin for a period of 7.9 ms in synchronization with the minute carry processing inside the IC. However, when real-time data is read, the minute carry processing is delayed by a maximum of 0.5 s and accordingly low output from the $\overline{\text{INT}}$ pin is also delayed by a maximum of 0.5 s. When the second data is rewritten by a real-time data write command, counting starts from the rewritten second data and as a result, the output interval during that period may become either longer or shorter.

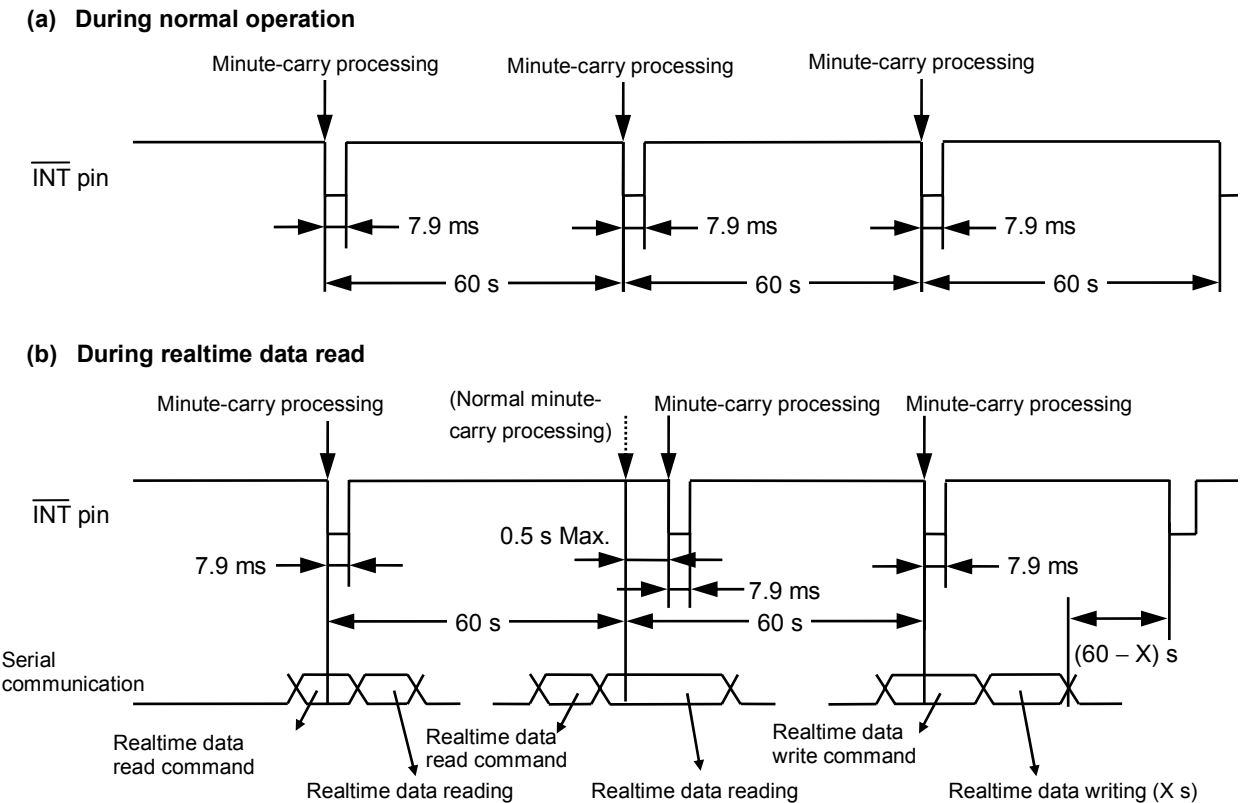

Figure 23 Timing of Per-Minute Steady Interrupt Output 2

- Caution**
1. When changing an output mode, give care to the state of INT1 register_1 and the output.
 2. If per-minute edge interrupt output or per-minute steady interrupt output is chosen, INT1 register_1 has no meaning.

(6) During power-on detector operation

When power is applied to this IC, power-on detection circuit operates, status register_1 is set to "80h" (bit 7 (POC flag) of status register_1 is set to 1) via the power-on detection circuit, and a 1 Hz clock is output from the $\overline{\text{INT}}$ pin.

INT1AE = INT1ME = 0, 32kE = 0

Figure 24 $\overline{\text{INT}}$ Pin Output Timing During Power-on Detector Operation

■ Clock Adjustment Function

A clock adjustment function is provided to logically perform slow/fast adjustment of the 32 kHz clock and correct a slow/fast clock with high accuracy. Use the clock adjustment register to set this function. When not using this function, be sure to set it to 00h.

The clock adjustment register value is calculated by the following expression.

(1) If current oscillation frequency > target frequency (in case the clock is fast)

$$\text{Register value}^{*1} = 128 - \text{Integral value} \left(\frac{(\text{Current oscillation frequency actual measurement value}^{*2}) - (\text{Target oscillation frequency}^{*3})}{(\text{Current oscillation frequency actual measurement value}^{*2}) \times (\text{Minimum resolution}^{*4})} \right)$$

Caution The figure range which can be corrected is that the calculated value is from 0 to 64.

- *1. The register value is the value set to the clock adjustment register. Set the binarized value of this value to the clock adjustment register.
- *2. This is the measurement value of the signal that is output to the $\overline{\text{INT}}$ pin when 1 Hz clock output setting is made (32kE = 0, INT1ME = 0, INT1FE = 1, INT1 register_1 is 01h).
- *3. This is the frequency to be adjusted by using the clock adjustment function.
- *4. For the minimum resolution, 3.052 ppm or 1.017 ppm can be set using B7 of the clock adjustment register. When B7 is 0, 3.052 ppm is set and logical slow/fast adjustment is performed every 20 seconds. When B7 is 1, 1.017 ppm is set and logical slow/fast adjustment is performed every 60 seconds.

Table 12

| | B7 = 0 | B7 = 1 |
|----------------------|--------------------------|------------------------|
| Slow/fast adjustment | Every 20 seconds | Every 60 seconds |
| Minimum resolution | 3.052 ppm | 1.017 ppm |
| Correction range | -195.3 ppm to +192.2 ppm | -65.1 ppm to +64.1 ppm |

◆ The example of calculated value 1

Current oscillation frequency actual measurement value = 1.000080[Hz],

Target oscillation frequency = 1.000000[Hz],

B7 = 0 (minimum resolution = 3.052ppm),

$$\text{Register value} = 128 - \text{Integral value} \left(\frac{(1.000080) - (1.000000)}{(1.000080) \times (3.052 \times 10^{-6})} \right)$$

$$= 128 - \text{Integral value} (26.21) = 128 - 26 = 102$$

Thus, set up (B7,B6,B5,B4,B3,B2,B1,B0) = (0,1,1,0,0,1,1,0) for the clock adjustment register.

(2) If current oscillation frequency < target frequency (in case the clock is slow)

$$\text{Register value} = \text{Integral value} \left(\frac{(\text{Target oscillation frequency}) - (\text{Current oscillation frequency actual measurement value})}{(\text{Current oscillation frequency}) \times (\text{Minimum resolution})} \right) + 1$$

Caution The figure range which can be corrected is that the calculated value is from 0 to 62.

◆ The example of calculated value 2

Current oscillation frequency actual measurement value = 0.999920[Hz],
 Target oscillation frequency = 1.000000[Hz],
 B7 = 0 (minimum resolution = 3.052ppm),

$$\begin{aligned} \text{Register value} &= \text{Integral value} \left(\frac{(1.000000) - (0.999920)}{(0.999920) \times (3.052 \times 10^{-6})} \right) + 1 \\ &= \text{Integral value } (26.21) + 1 = 26 + 1 = 27 \end{aligned}$$

Thus, set up (B7,B6,B5,B4,B3,B2,B1,B0) = (0,0,0,1,1,0,1,1) for the clock register.

◆ The example of calculated value 3

Current oscillation frequency actual measurement value = 0.999920[Hz],
 Target oscillation frequency = 1.000000[Hz],
 B7 = 1 (minimum resolution = 1.017ppm),

$$\begin{aligned} \text{Register value} &= \text{Integral value} \left(\frac{(1.000000) - (0.999920)}{(0.999920) \times (1.017 \times 10^{-6})} \right) + 1 \\ &= \text{Integral value } (78.66) + 1 \end{aligned}$$

Thus, this calculated value exceeds the correctable range 0 to 62,
 B7 = "1" (minimum resolution = 1.017 ppm) indicates the correction is impossible.

Serial Interface

The S-35190A receives various commands via a 3-wire serial interface to read/write data. This section covers the transfer methods of this product.

1. Data reading

When data is input from the SIO pin in synchronization with the falling of the $\overline{\text{SCK}}$ pin after setting the CS pin to "H", the data is loaded internally. When $\text{R}/\overline{\text{W}}$ bit = "1" is loaded at the eighth rising of the SCK clock, the state of data reading is entered. Data corresponding to each command is then output in synchronization with the falling of the subsequent SCK clock input.

Remark When the number of SCK clocks is less than eight, the state of clock waiting is entered and no processing occurs.

2. Data writing

When data is input from the SIO pin in synchronization with the falling of the $\overline{\text{SCK}}$ pin after setting the CS pin to "H", the data is loaded internally. When $\text{R}/\overline{\text{W}}$ bit = "0" is loaded at the eighth rising of the SCK clock, the state of data writing is entered. In this state, the data, which is input in synchronization with the falling of the subsequent SCK clock input, is written to registers according to each command.

Seiko Instruments Inc.

(3) Status register_1 access and status register_2 access

*1. 0: Status register_1 selected, 1: Status register_2 selected

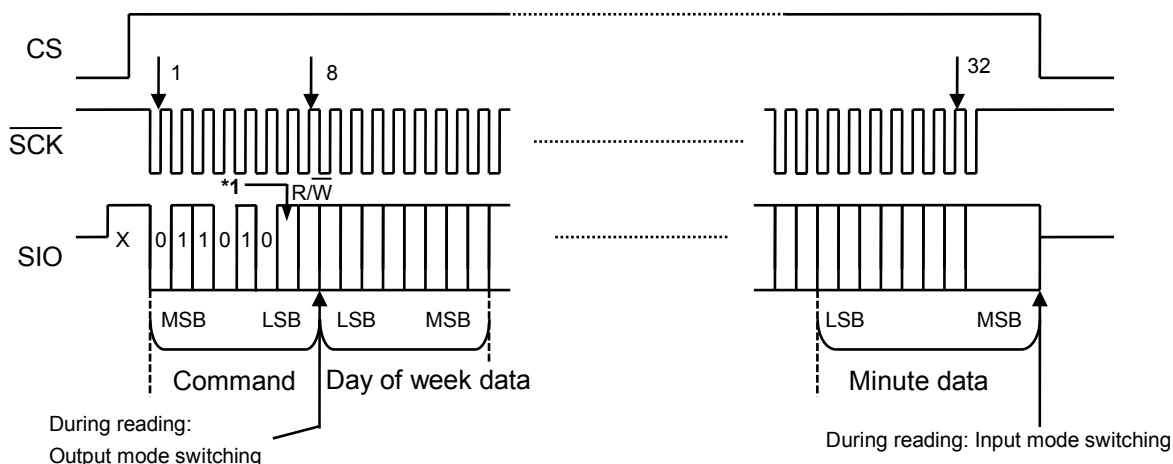

Figure 27 Status Register_1 Access and Status Register_2 Access

(4) INT1 register_1 access and INT1 register_2 access

Since data written to and read from INT1 register_1 varies according to the setting of status register_2, be sure to set status register_2 before reading/writing INT1 register_1. When an alarm is set using status register_2, these registers function as 3-byte alarm time data registers, and other than that, they function as 1-byte registers. When the selected frequency steady interrupt setting is set, the data in these registers is frequency duty setting data.

Caution Alarm data and frequency duty data cannot be operated simultaneously.

The INT2AE setting of status register_2 must be made before reading/writing INT1 register_2. When the INT2AE is "1", it is 3-byte alarm time data. INT1 register_2 does not include frequency duty data. For details of each data, refer to "Status register_1" and "Status register_2".

■ Example of Software Processing

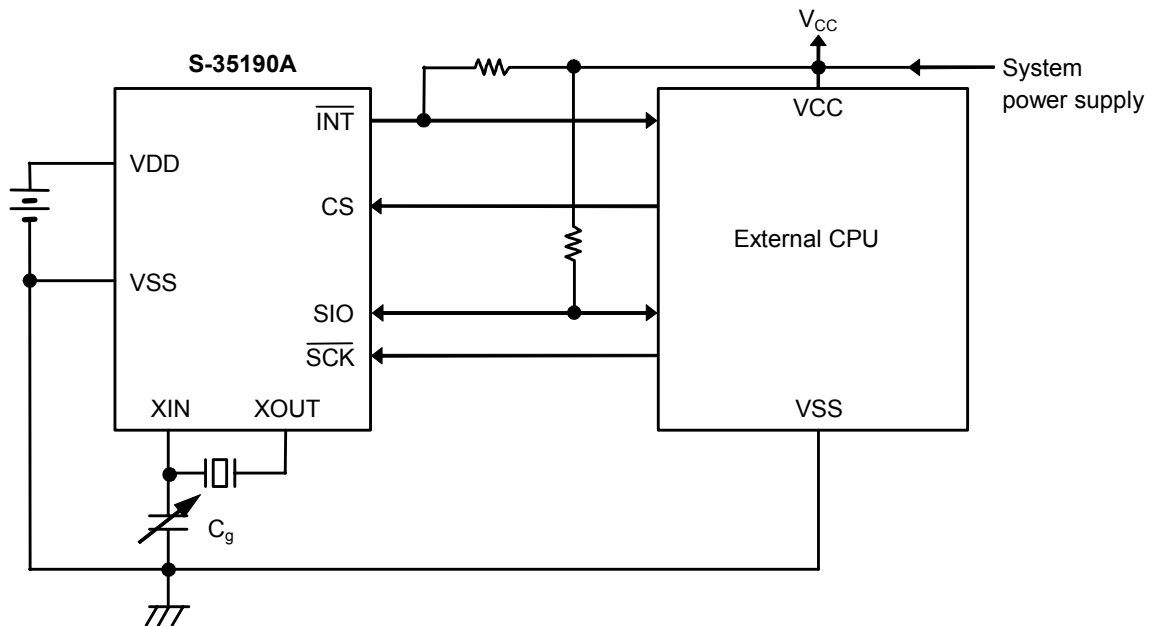

1. Initialization flow at power-on

*1. If conditions are poor (e.g., in a noisy environment) and there is a high probability that commands transmitted via serial communication will be garbled, it is recommended to verify the TEST flag.

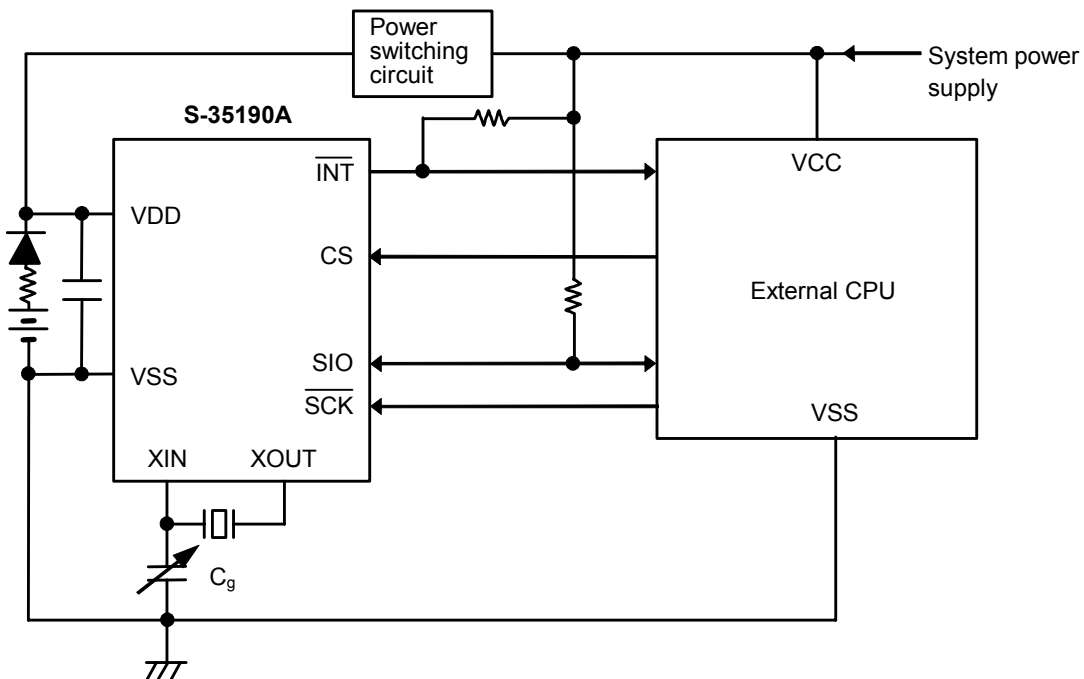

Figure 32 Initialization Flow

■ Examples of Application Circuits

- Caution**
1. Because the I/O pin has no protective diode on the V_{CC} side, the relation of V_{CC} ≥ V_{DD} is possible. But pay careful attention to the specifications.
 2. Communication should be executed after the system power supply is turned on and a stable state is obtained.

Figure 33 Application Circuit 1

- Caution** Communication should be executed after the system power supply is turned on and a stable state is obtained.

Figure 34 Application Circuit 2

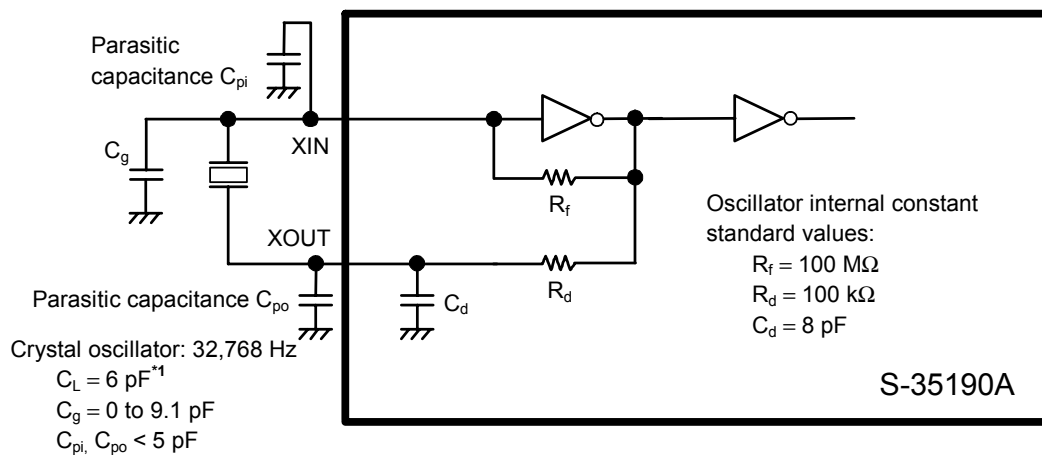

Caution The above connection diagrams do not guarantee operation. Set the constants after performing sufficient evaluation using the actual application.

■ Adjustment of Oscillation Frequency

1. Configuration of oscillator

Since crystal oscillation is sensitive to external noise (the clock accuracy is affected), the following measures are essential for optimizing the oscillator configuration.

- (1) Place the S-35190A, crystal oscillator, and external capacitor (C_g) as close to each other as possible.
- (2) Increase the insulation resistance between pins and the substrate wiring patterns of XIN and XOUT.
- (3) Do not place any signal or power lines close to the oscillator.

*1. When using the crystal oscillator with a C_L value of 7 pF, externally connect C_d .

Figure 35 Connection Diagram 1

Figure 36 Connection Diagram 2

2. Measurement of oscillation frequency

When the S-35190A is turned on, the internal power-on detector operates and a signal of 1 Hz is output from the $\overline{\text{INT}}$ pin to select the crystal oscillator and optimize the C_g value. Turn the power on and measure the signal with a frequency counter following the circuit configuration shown in **Figure 37**. A signal of 1 Hz may not be output depending on the state in which power is applied, so set the selected frequency steady interrupt using status register_2 and then set 1 Hz signal output using INT1 register_1 to generate a normal output. For further details, refer to “**Interrupts**”.

Remark If the error range is ± 1 ppm in relation to 1 Hz, the time is shifted by approximately 2.6 seconds per month (calculated using the following expression).

$$10^{-6} (1 \text{ ppm}) \times 60 \text{ seconds} \times 60 \text{ minutes} \times 24 \text{ hours} \times 30 \text{ days} = 2.592 \text{ seconds}$$

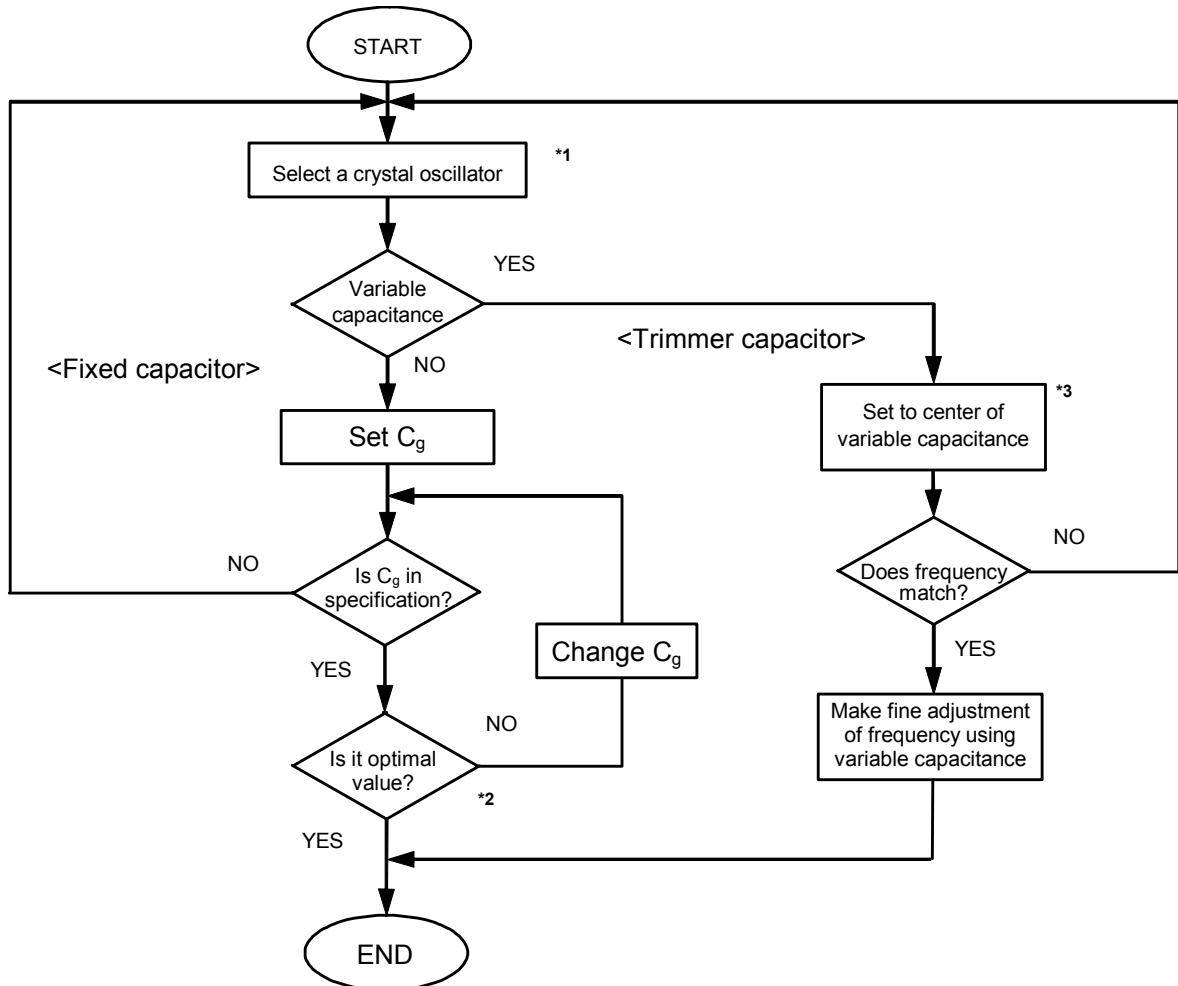

Figure 37 Configuration of Oscillation Frequency Measurement Circuit

- Caution**
1. Use a high-accuracy frequency counter (1 ppm order).
 2. Since the 1 Hz signal continues to be output, initialization must be executed during normal operation.
 3. Refer to the frequency slow/fast range characteristics for C_g .

3. Adjustment of oscillation frequency

(1) Adjustment by setting C_g

Matching of the crystal oscillator with the nominal frequency must be performed with the stray capacitance on the board included. Select a crystal oscillator and optimize the C_g value in accordance with the flowchart below.

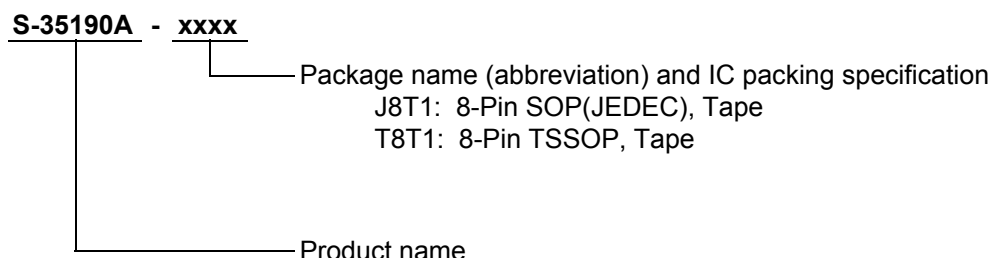

- *1. For the matching adjustment of the IC with a crystal, contact the crystal manufacturer to determine the C_L value (load capacitance) and R_1 value (equivalent series resistance). $C_L = 6$ pF and $R_1 = 30$ k Ω typ. are recommended values.
- *2. The C_g value must be selected on the actual PCB since it is affected by stray capacitance. Select the external C_g value in a range of 0 pF to 9.1 pF.
- *3. Adjust the rotation angle of the variable capacitance so that the capacitance value is slightly smaller than the center, and confirm the oscillation frequency and the center value of the variable capacitance. This is done in order to make the capacitance of the center value smaller than one half of the actual capacitance value because a smaller capacitance value increases the frequency variation.

Figure 38 Crystal Oscillator Setting Flow

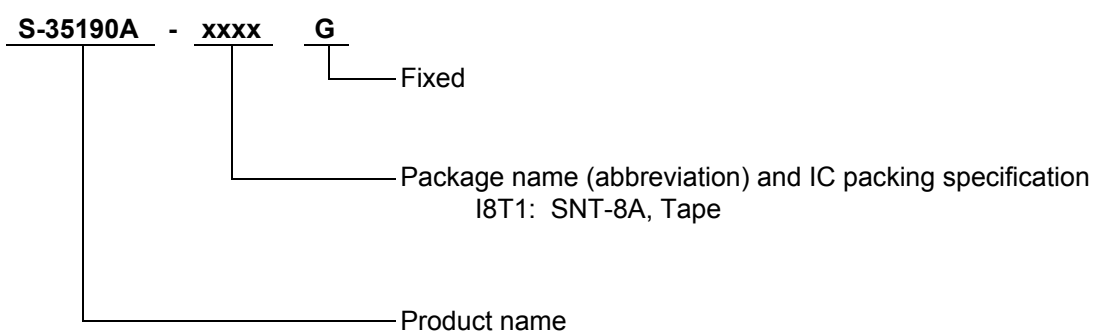

- Caution**
1. The oscillation frequency varies depending on the ambient temperature and power supply voltage. Refer to the characteristics examples.
 2. The 32 kHz crystal oscillator operates more slowly at an operating temperature than higher or lower 20 to 25°C. Therefore, it is recommended to adjust or set the oscillator to operate slightly faster at normal temperature.

■ Product Name Structure

1. 8-Pin SOP(JEDEC), 8-Pin TSSOP package

2. SNT-8A package

■ Precautions

- Although the IC contains a static electricity protection circuit, static electricity or voltage that exceeds the limit of the protection circuit should not be applied.
- Seiko Instruments Inc. assumes no responsibility for the way in which this IC is used in products created using this IC or for the specifications of that product, nor does Seiko Instruments Inc. assume any responsibility for any infringement of patents or copyrights by products that include this IC either in Japan or in other countries.
