### General Description

The SL2309NZ is a low skew, jitter and power fanout buffer designed to produce up to nine (9) clock outputs from one (1) reference input clock, for high speed clock distribution, including PCI/PCI-X applications.

### Input and output Frequency Range

The input and output frequency is the same (1x) for SL2309NZ and the product operates from DC to 140MHz clock range with 15pF and 100MHz with 30pF output loads.

### High Drive Capability

The SL2309NZ is designed to meet high drive requirements for up to 30pF load condition per electrical specifications.

If higher drive levels are required refer to SL23EP09NZ fanout buffer product.

### Output Clock Skew

All outputs should drive the similar load to achieve output-to-output skew specifications as given in the switching electrical tables.

### Power Supply Range (VDD)

The SL2309NZ is designed to operate 3.3V+/-10% (3.63V-max to 2.97V-min) VDD power supply range. An internal on-chip voltage regulator is used to provide a constant power supply of 1.8V, leading to a consistent and stable electrical performance in terms of skew and jitter. The SL2309NZ I/O is powered by using VDD=3.3V+/-10%.

Refer to SL23EP09NZ products for DC to 220MHz-max frequency range, 2.5V power supply operation, improved skew, jitter and higher drive options.

Contact SLI for 1.8V power supply Buffers and ZDB products.

## External Components & Design Considerations

### Typical Application Schematic

### Comments and Recommendations

**Decoupling Capacitor:** A decoupling capacitor of  $0.1\mu\text{F}$  must be used between all VDD and VSS pins. Place the capacitor on the component side of the PCB as close to the VDD pin as possible. The PCB trace to the VDD pin and to the GND via should be kept as short as possible. Do not use vias between the decoupling capacitor and the VDD pin.

**Series Termination Resistor:** A series termination resistor is recommended if the distance between the output clocks and the load is over  $1\frac{1}{2}$  inch. Place the series termination resistors as close to the clock outputs as possible.
