

4-BIT SINGLE-CHIP MICROCONTROLLERS**DESCRIPTION**

The μ PD754244 is a 4-bit single-chip microcontroller which incorporates the EEPROM™ for key-less entry application.

It incorporates a 16×8 -bit EEPROM, a 4-Kbyte mask ROM to store software, a 128×4 -bit RAM to store the processing data, a processing CPU, and a carrier generator which easily outputs waveforms for infrared remote controller.

The details of functions are described in the following user's manual. Be sure to read it before designing.

μ PD754144, 754244 User's Manual: U10676E

FEATURES

- On-chip EEPROM: 16×8 bits (mapped to the data memory)
- On-chip key return reset function for key-less entry
- System clock oscillation circuit
 - μ PD754144: RC oscillator (external resistor and capacitor)
 - μ PD754244: Crystal/ceramic oscillator
- Low-voltage operation: $V_{DD} = 1.8$ to 6.0 V
- Timer function (4 channels)
 - Basic interval timer/watchdog timer: 1 channel
 - 8-bit timer counter : 3 channels
- On-chip memory
 - Program memory (ROM)
 4096×8 bits
 - Data memory (static RAM)
 128×4 bits
- Instruction execution time variable function suited for power saving.
 - μ PD754144:
4, 8, 16, 64 μ s (at fcc = 1.0-MHz operation)
 - μ PD754244:
0.95, 1.91, 3.81, 15.3 μ s (at fx = 4.19-MHz operation)
0.67, 1.33, 2.67, 10.7 μ s (at fx = 6.0-MHz operation)

APPLICATIONS

Automotive appliances such as key-less entry, compact data carrier, etc.

Unless contextually excluded, references in this data sheet to the μ PD754244 (crystal/ceramic oscillation: fx) mean the μ PD754144.

The μ PD754144 and μ PD754244 differ in the notation of their RC oscillation: whenever fx (RC oscillation notation for μ PD754244) is described, fcc should be substituted for the μ PD754144.

The information in this document is subject to change without notice.

ORDERING INFORMATION

Part Number	Package
μ PD754144GS-xxx-BA5	20-pin plastic SOP (300 mil, 1.27-mm pitch)

3. PIN FUNCTION

3.1 Port Pins

Pin Name	Input/Output	Alternate Function	Function	8-bit I/O	After Reset	I/O Circuit TYPE ^{Note 1}
P30	Input/Output	PTO0	Programmable 4-bit input/output port (PORT3). This port can be specified input/output bit-wise. On-chip pull-up resistor connection can be specified by software in 4-bit units.	—	Input	E-B
P31		PTO1				
P32		PTO2				
P33		—				
P60	Input/Output	AV _{REF}	Programmable 4-bit input/output port (PORT6). This port can be specified input/output bit-wise. On-chip pull-up resistor can be specified by software in 4-bit units ^{Note 2} . Noise eliminator can be selected with P61/INT0.	—	Input	Ⓕ-A
P61		INT0				
P62		PTH00				
P63		PTH01				
P70	Input	KR4	4-bit input port (PORT7). On-chip pull-up resistor can be specified by software bit-wise.	—	Input	Ⓑ-A
P71		KR5				
P72		KR6				
P73		KR7				
P80	Input/Output	—	1-bit input/output port (PORT8). On-chip pull-up resistor connection can be specified by software.	—	Input	Ⓕ-A

Notes 1. Circled characters indicate the Schmitt-trigger input.

2. Do not specify an on-chip pull-up resistor connection when using the programmable threshold port.

3.2 Non-port Pins

Pin Name	Input/Output	Alternate Function	Function		After Reset	I/O Circuit TYPE ^{Note}
PTO0	Output	P30	Timer counter output pins		Input	E-B
PTO1		P31				
PTO2		P32				
INT0	Input	P61	Edge detection vectored interrupt input pin (detected edge can be selected) Noise elimination circuit can be selected.	Noise elimination circuit can be selected. Asynchronous input	Input	Ⓕ-A
KR4 to KR7	Input	P70 to P73	Falling edge detection testable input pins		Input	Ⓑ-A
PTH00	Input	P62	Threshold voltage-variable 2-bit analog input pins		Input	Ⓕ-A
PTH01		P63				
KRREN	Input	—	Key return reset enable pin The reset signal is generated at the falling edge of KRn while KRREN is high in STOP mode.		Input	Ⓑ
AV _{REF}	Input	P60	Reference voltage input pin		Input	Ⓕ-A
CL1	—	—	Incorporated in the μ PD754144 only RC (for system clock oscillation) connection pin External clock cannot be input.		—	—
CL2	—					
X1	Input	—	Incorporated in the μ PD754244 only Crystal/ceramic resonator (for system clock oscillation) connection pin When inputting the external clock, input the external clock to pin X1 and input the inverted phase of the external clock to pin X2.		—	—
X2	—					
RESET	Input	—	System reset input pin (low-level active) Pull-up resistor can be incorporated (mask option).		—	Ⓑ-A
IC	—	—	Internally Connected Connect directly to V _{DD} .		—	—
V _{DD}	—	—	Positive supply pin		—	—
V _{SS}	—	—	Ground potential		—	—

Note Circled characters indicate the Schmitt-trigger input.

3.3 Pin Input/Output Circuits

The μPD754244 pin input/output circuits are shown schematically.

3.4 Recommended Connection of Unused Pins

Table 3-1. List of Recommended Connection of Unused Pins

Pin	Recommended Connecting Method
P30/PTO0	Input state : Independently connect to V_{SS} or V_{DD} via a resistor. Output state: Leave open.
P31/PTO1	
P32/PTO2	
P33	
P60/ AV_{REF}	
P61/INT0	
P62/PTH00	
P63/PTH01	
P70/KR4	Connect to V_{DD} .
P71/KR5	
P72/KR6	
P73/KR7	
P80	Input state : Independently connect to V_{SS} or V_{DD} via a resistor. Output state: Leave open.
KRREN	
IC	Connect directly to V_{DD} .

4. SWITCHING FUNCTION BETWEEN MK I MODE AND MK II MODE

4.1 Difference between Mk I and Mk II Modes

The μ PD754244 75XL CPU has the following two modes: Mk I and Mk II, either of which can be selected. The mode can be switched by the bit 3 of the Stack Bank Select register (SBS).

- Mk I mode: Instructions are compatible with the 75X series. Can be used in the 75XL CPU with a ROM capacity of up to 16 Kbytes.
- Mk II mode: Incompatible with 75X series. Can be used in all the 75XL CPU's including those products whose ROM capacity is more than 16 Kbytes.

Table 4-1. Differences between Mk I Mode and Mk II Mode

	Mk I Mode	Mk II Mode
Number of stack bytes for subroutine instructions	2 bytes	3 bytes
BRA !addr1 instruction CALLA !addr1 instruction	Not available	Available
CALL !addr instruction	3 machine cycles	4 machine cycles
CALLF !faddr instruction	2 machine cycles	3 machine cycles

Caution The Mk II mode supports a program area exceeding 16 Kbytes for the 75X and 75XL Series. Therefore, this mode is effective for enhancing software compatibility with products that have a program area of more than 16 Kbytes.

With regard to the number of stack bytes during execution of subroutine call instructions, the usable area increases by 1 byte per stack compared to the Mk I mode when the Mk II mode is selected.

However, when the CALL !addr and CALLF !faddr instructions are used, the machine cycle becomes longer by 1 machine cycle. Therefore, if more emphasis is placed on RAM use efficiency and processing performance than on software compatibility, the Mk I mode should be used.

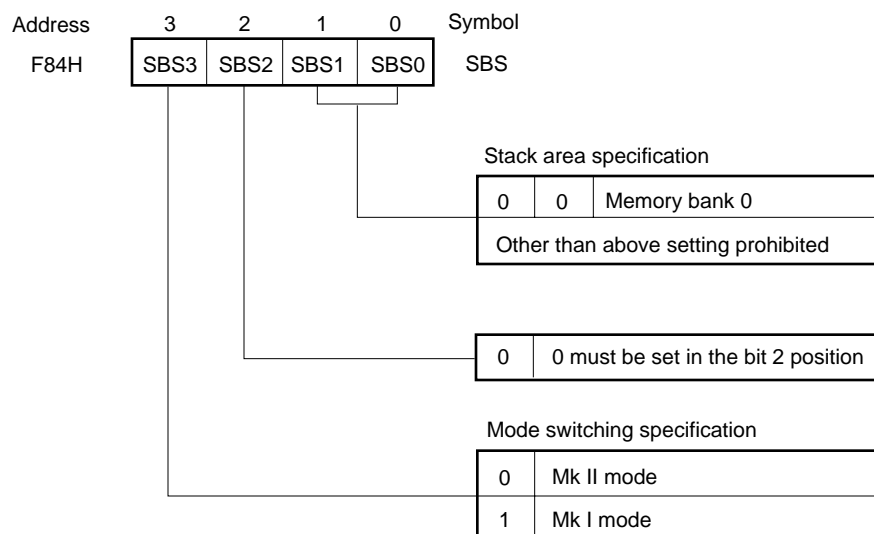

4.2 Setting Method of Stack Bank Select Register (SBS)

Switching between the Mk I mode and Mk II mode can be done by the SBS. Figure 4-1 shows the format.

The SBS is set by a 4-bit memory manipulation instruction.

When using the Mk I mode, the SBS must be initialized to 1000B at the beginning of a program. When using the Mk II mode, it must be initialized to 0000B.

Figure 4-1. Stack Bank Select Register Format

Caution Because SBS. 3 is set to “1” after a $\overline{\text{RESET}}$ signal is generated, the CPU operates in the Mk I mode. When executing an instruction in the Mk II mode, set SBS. 3 to “0” to select the Mk II mode.

5. MEMORY CONFIGURATION

- **Program memory (ROM)** ... 4096 x 8 bits

- Addresses 0000H and 0001H

Vector table wherein the program start address and the values set for the RBE and MBE at the time a $\overline{\text{RESET}}$ signal is generated are written. Reset and start are possible at an arbitrary address.

- Addresses 0002H to 000FH

Vector table wherein the program start address and values set for the RBE and MBE by the vectored interrupts are written. Interrupt service can be started at an arbitrary address.

- Addresses 0020H to 007FH

Table area referenced by the GETI instruction^{Note}.

Note The GETI instruction realizes a 1-byte instruction on behalf of an arbitrary 2-byte instruction, 3-byte instruction, or two 1-byte instructions. It is used to decrease the program steps.

- **Data memory**

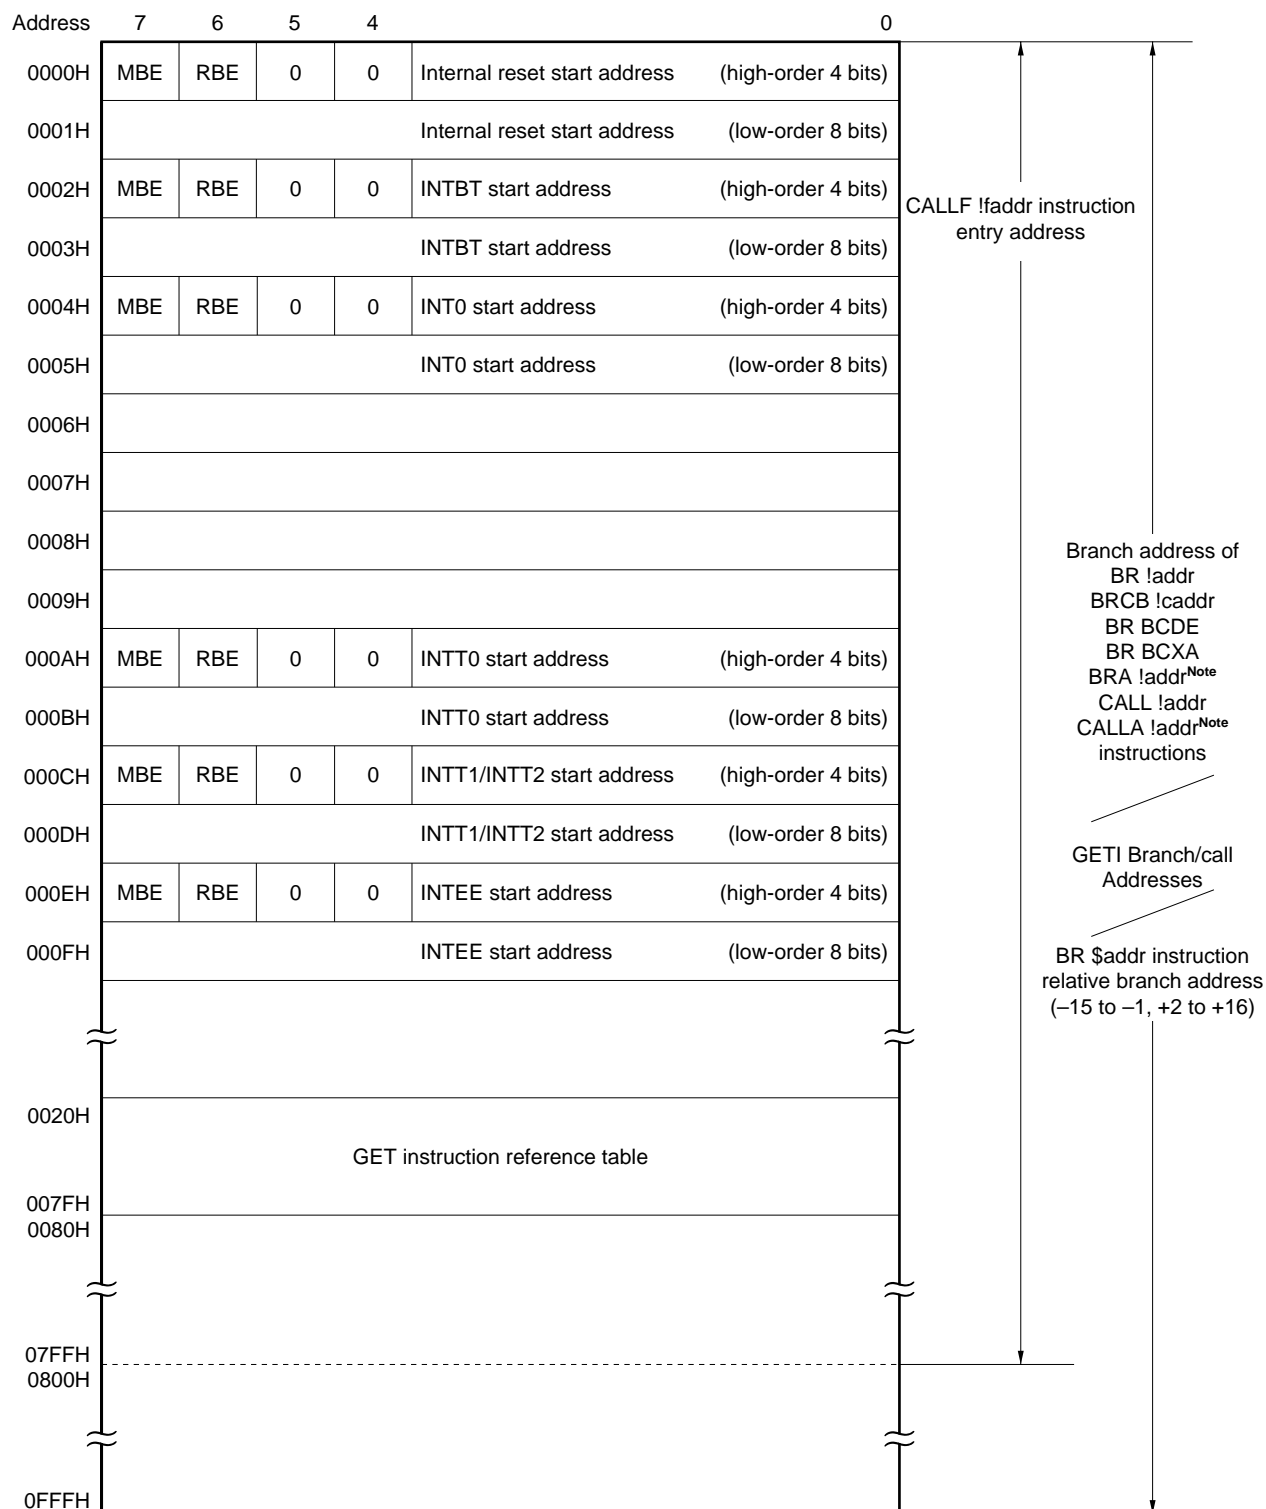

- Data area

Static RAM ... 128 words x 4 bits (000H to 07FH)

EEPROM ... 16 words x 8 bits (400H to 41FH)

- Peripheral hardware area ... 128 words x 4 bits (F80H to FFFH)

Figure 5-1. Program Memory Map

Note Can be used in the MkII mode only.

Remark In addition to the above, a branch can be made to an address with the low-order 8-bits only of the PC changed by means of a BR PCDE or BR PCXA instruction.

Figure 5-2. Data Memory Map

6. EEPROM

The μ PD754244 incorporates 16 words \times 8 bit EEPROM (Electrically Erasable PROM) as well as static RAM (128 words \times 4 bit) as a data memory.

The EEPROM incorporated into the μ PD754244 has the following features.

- (1) Written data is retained if power is turned off.
- (2) 8-bit data manipulation (auto-erase/auto-write) is available by memory manipulation instruction as well as for static RAM. However available instructions are restricted.
- (3) It can reduce loads of software because the auto-erase and/or auto-write operation is performed by hardware.
- (4) Write operation control using the interrupt request

The interrupt request is generated under following conditions.

- Terminates write operation
- Write status flag

It is possible to check whether enables or disables write operation by bit manipulation instructions.

7. PERIPHERAL HARDWARE FUNCTIONS

7.1 Digital Input/Output Ports

The following two types of I/O ports are provided.

• CMOS input (Port 7)	:	4
• CMOS I/O (Ports 3, 6, 8)	:	9
Total	:	13

Table 7-1. Types and Features of Digital Ports

Port Name	Function	Operation and Features	Remarks
PORT3	4-bit I/O	Can be set to input or output mode bit-wise.	Also used as PTO0 to PTO2 pins.
PORT6			Also used as AV _{REF} , INT0, PTH00, and PTH01 pins.
PORT7	4-bit input	4-bit input only port On-chip pull-up resistor connection can be specified by mask option bit-wise.	Also used as KR4 to KR7 pins.
PORT8	1-bit I/O	Can be set to input or output mode bit wise.	—

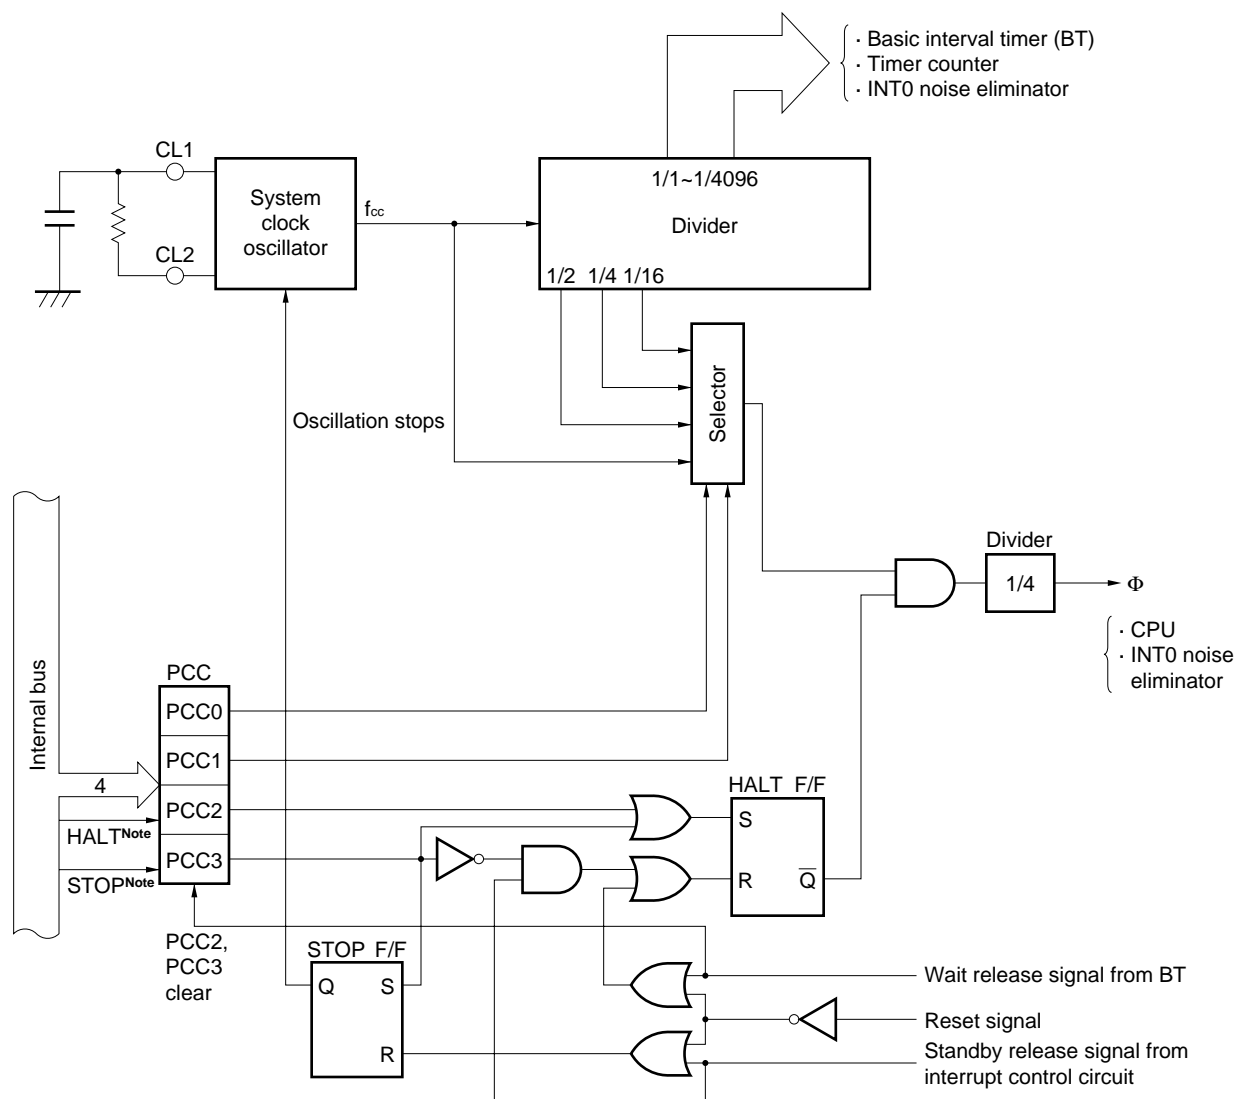

7.2 Clock Generator

The clock generator provides the clock signals to the CPU and peripheral hardware. Its configuration is shown in Figures 7-1 and 7-2.

The operation of the clock generator is set with the processor clock control register (PCC).

The instruction execution time can be changed.

- μPD754144
 - 4, 8, 16, 64 μs (when the system clock fcc operates at 1.0 MHz)
- μPD754244
 - 0.95, 1.91, 3.81, 15.3 μs (when the system clock fx operates at 4.19 MHz)
 - 0.67, 1.33, 2.67, 10.7 μs (when the system clock fx operates at 6.0 MHz)

Figure 7-1. μ PD754144 (RC Oscillation) Clock Generator Block Diagram

Note Instruction execution

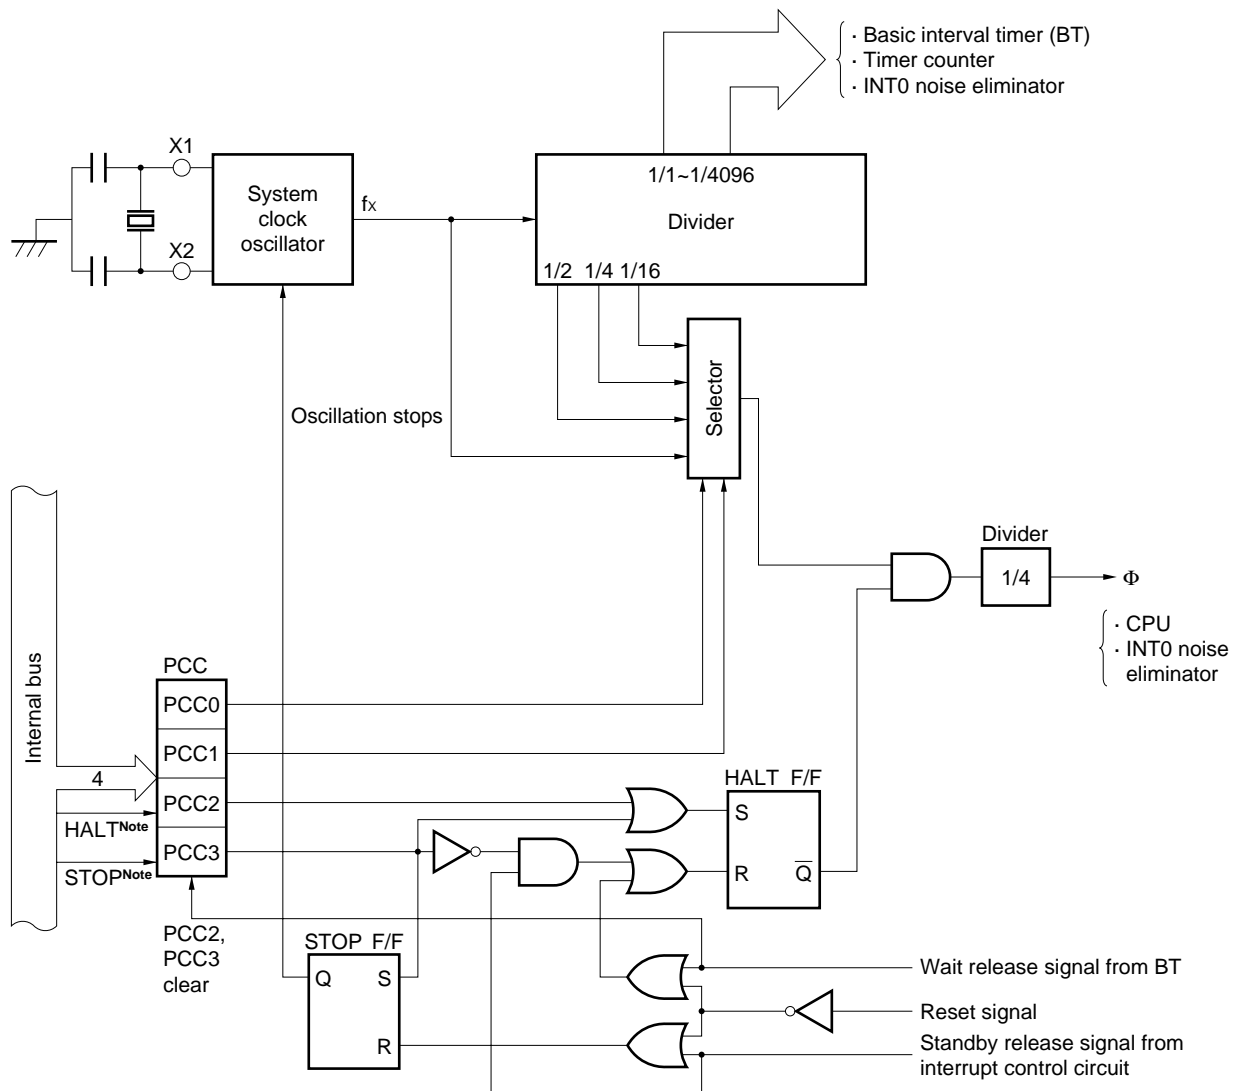

Remarks 1. f_{cc} : System clock frequency

2. Φ = CPU clock

3. PCC: Processor Clock Control Register

4. One clock cycle (t_{cy}) of the CPU clock is equal to one machine cycle of the instruction.

Figure 7-2. μPD754244 (Crystal/Ceramic Oscillation) Clock Generator Block Diagram

Note Instruction execution

Remarks 1. f_x : System clock frequency

2. Φ = CPU clock

3. PCC: Processor Clock Control Register

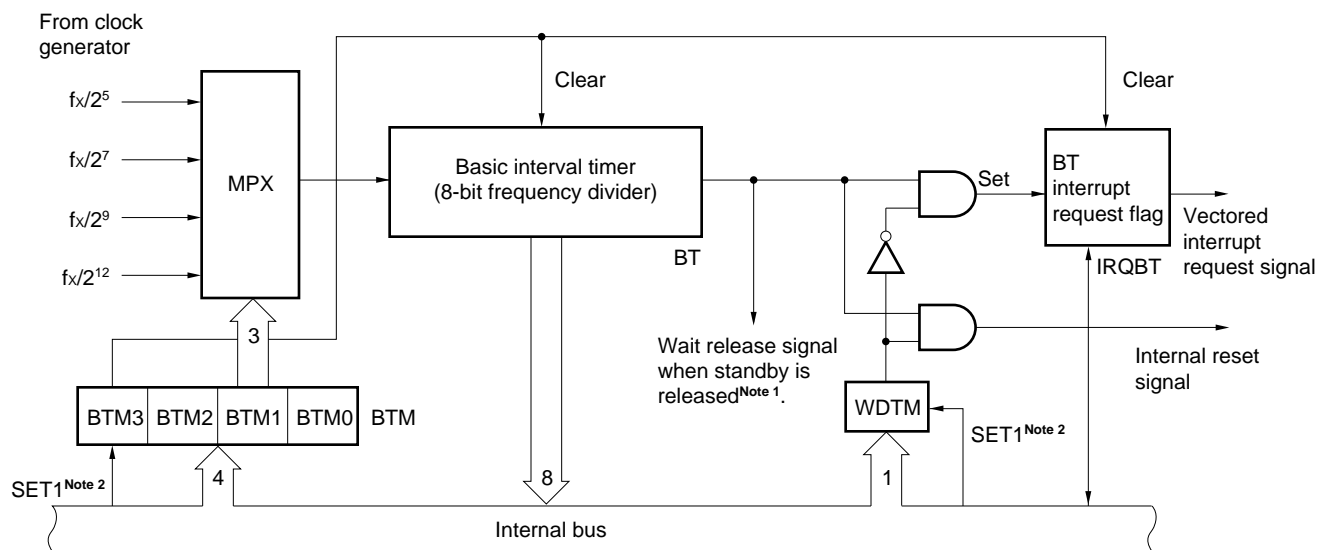

4. One clock cycle (t_{cy}) of the CPU clock is equal to one machine cycle of the instruction.

7.3 Basic Interval Timer/Watchdog Timer

The basic interval timer/watchdog timer has the following functions.

- (a) Interval timer operation to generate a reference time interrupt
- (b) Watchdog timer operation to detect a runaway of program and reset the CPU
- (c) Selects and counts the wait time when the standby mode is released (μ PD754244 only)^{Note 1}
- (d) Reads the contents of counting

Figure 7-3. Basic Interval Timer/Watchdog Timer Block Diagram

Notes 1. In the μ PD754144 (RC oscillation), the wait time cannot be specified when the standby mode is released. The oscillation stabilization wait time is negligible in the μ PD754144 and this device returns to the normal operation mode after counting $2^9/f_{cc}$ (512 μ s: @ $f_{cc} = 1.0$ -MHz operation). In the μ PD754244 (crystal/ceramic oscillation), on the other hand, the wait time can be specified when the standby mode is released.

2. Instruction execution.

7.4 Timer Counter

The μPD754244 incorporates three channels of timer counters. Its configuration is shown in Figures 7-4 to 7-6.

The timer counter has the following functions.

- (a) Programmable interval timer operation
- (b) Square wave output of any frequency to PTO0-PTO2 pins
- (c) Count value read function

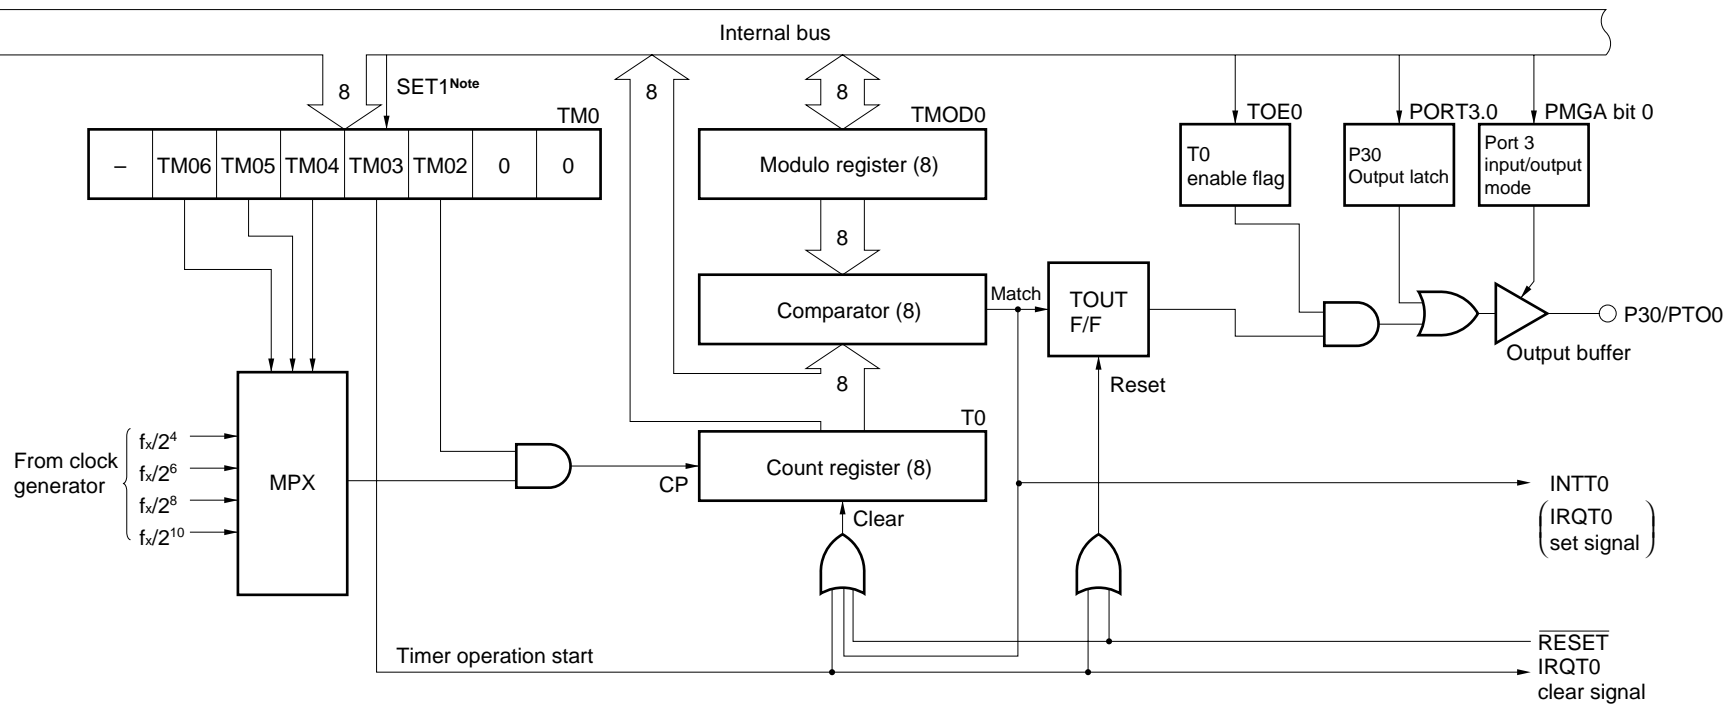

The timer counter can operate in the following four modes as set by the mode register.

Table 7-2. Mode List

Mode \ Channel	Channel 0	Channel 1	Channel 2	TM11	TM10	TM21	TM20
8-bit timer counter mode	○	○	○	0	0	0	0
PWM pulse generator mode	×	×	○	0	0	0	1
16-bit timer counter mode	×	○		1	0	1	0
Carrier generator mode	×	○		0	0	1	1

Remark ○ : Available
 × : Not available

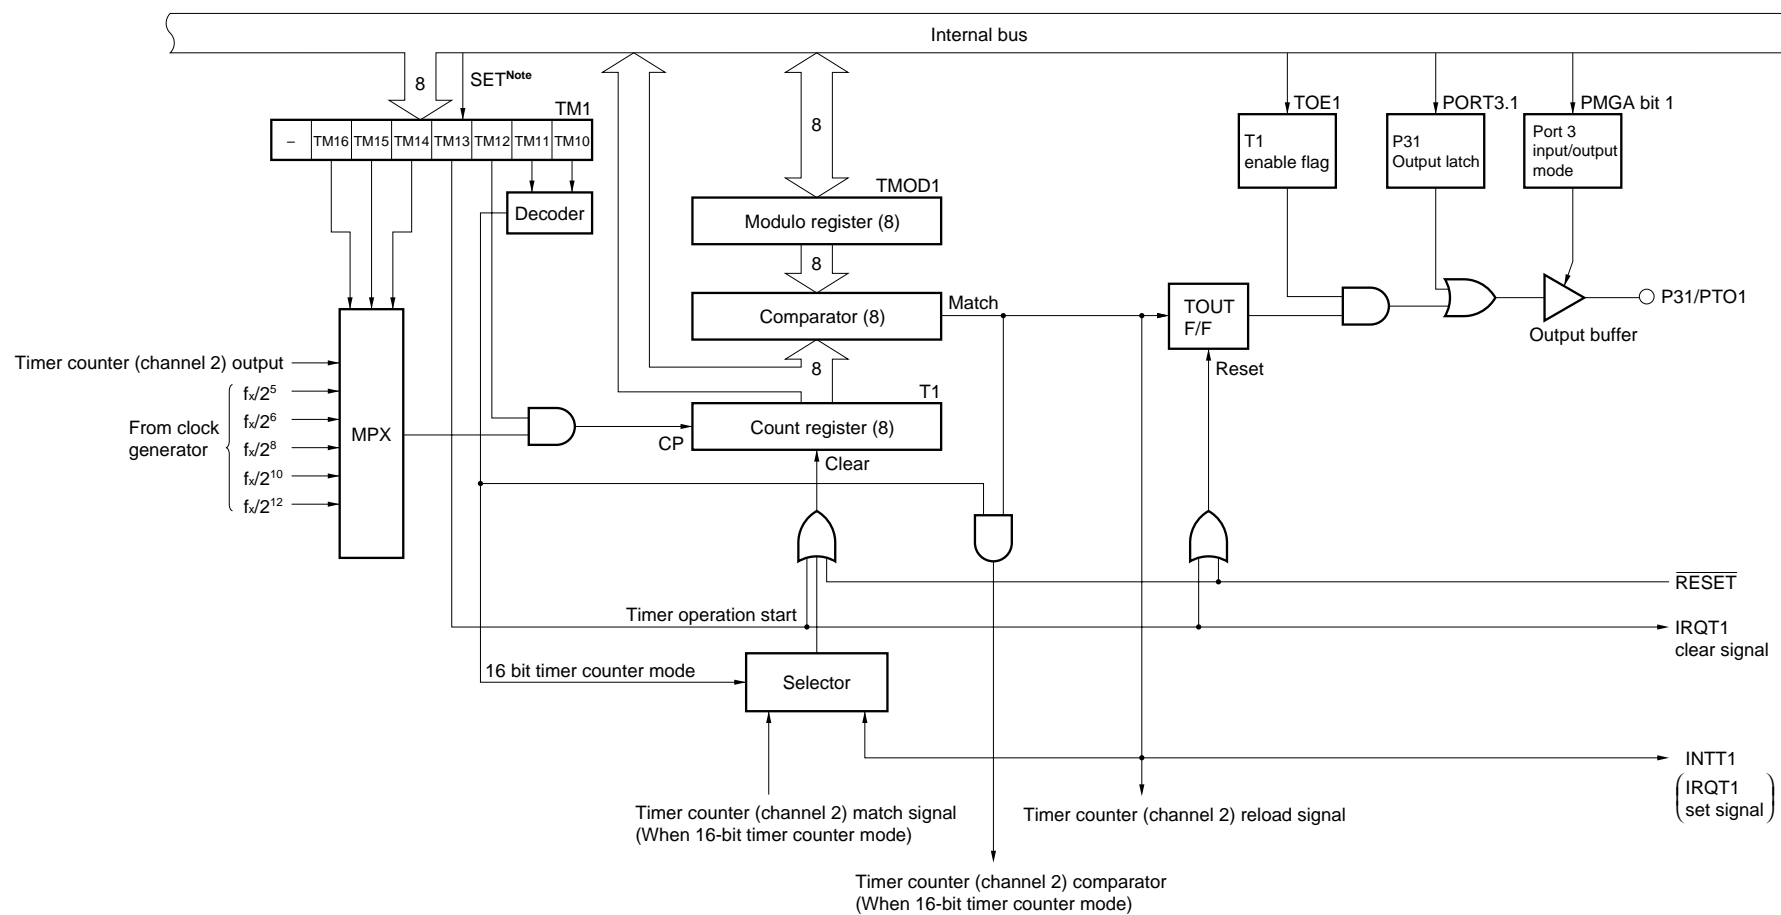

Figure 7-4. Timer Counter (Channel 0) Block Diagram

Note Instruction execution

Caution When setting data to TM0, be sure to set bits 0 and 1 to 0.

Figure 7-5. Timer Counter (Channel 1) Block Diagram

Note Instruction execution

μPD754144, 754244

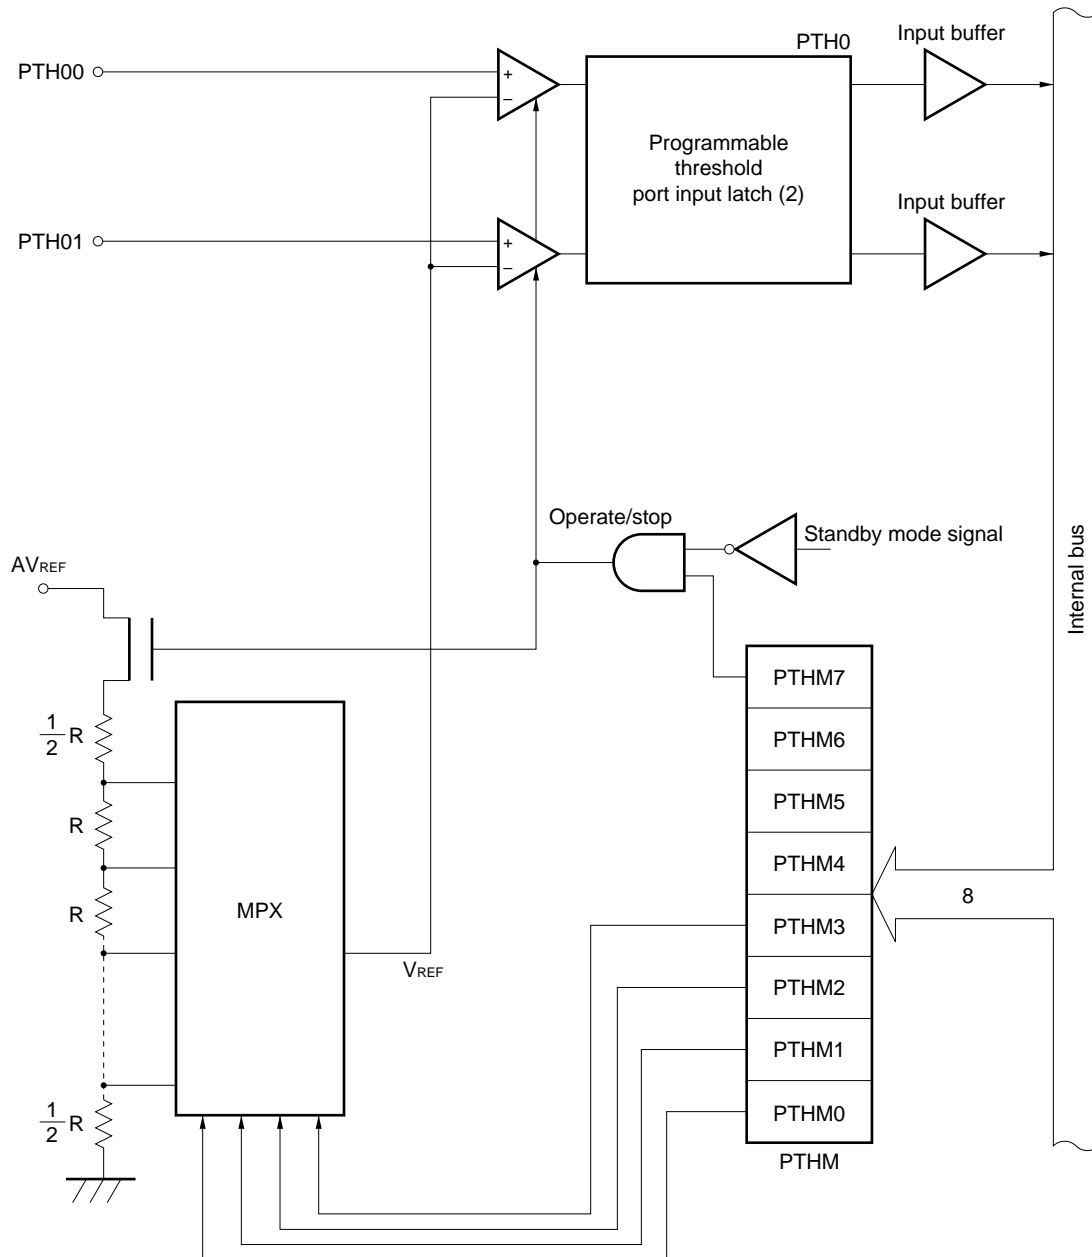

7.5 Programmable Threshold Port (Analog Input Port)

The μPD754244 provides analog input pins (PTH00, PTH01) whose threshold voltage (reference voltage) is selectable within sixteen steps. The following operations can be performed with these analog input pins.

- (1) Comparator operation
- (2) 4-bit resolution A/D converter operation (controlled by software)

Caution Do not specify an on-chip pull-up resistor connection for Port 6 when using the programmable threshold port.

Figure 7-7. Programmable Threshold Port Block Diagram

7.6 Bit Sequential Buffer 16 Bits

The bit sequential buffer (BSB) is a special data memory for bit manipulation and the bit manipulation can be easily performed by changing the address specification and bit specification in sequence, therefore it is useful when processing large data bit-wise.

Figure 7-8. Bit Sequential Buffer Format

- Remarks 1.** In the pmem.@L addressing, the specified bit moves corresponding to the L register.
- 2.** In the pmem.@L addressing, the BSB can be manipulated regardless of MBE/MSB specification.

8. INTERRUPT FUNCTION AND TEST FUNCTION

Figure 8-1 shows the interrupt control circuit. Each hardware device is mapped in the data memory space.

The interrupt control circuit of the μ PD754244 has the following functions.

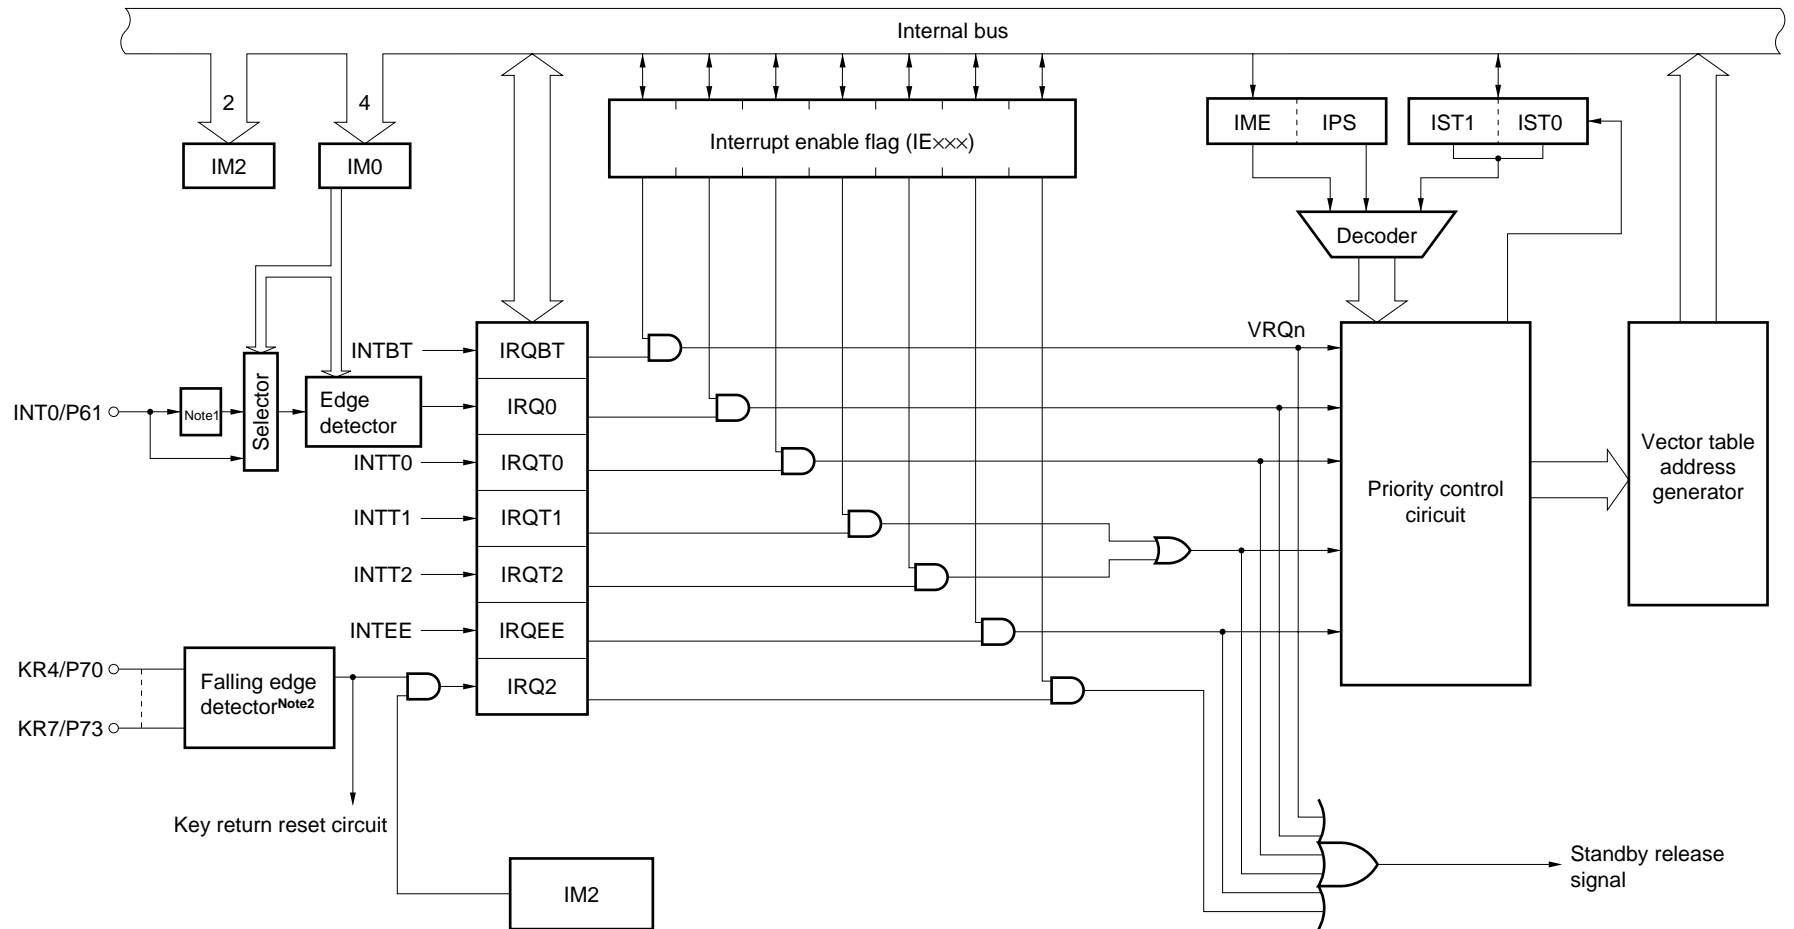

(1) Interrupt function

- Vectored interrupt function for hardware control, enabling/disabling the interrupt acknowledgement by the interrupt enable flag (IE $\times\times\times$) and interrupt master enable flag (IME).
- Can set any interrupt start address.
- Multiple interrupts wherein the order of priority can be specified by the interrupt priority select register (IPS).
- Test function of interrupt request flag (IRQ $\times\times\times$). An interrupt generated can be checked by software.
- Release the standby mode. A release interrupt can be selected by the interrupt enable flag.

(2) Test function

- Test request flag (IRQ2) generation can be checked by software.
- Release the standby mode. The test source to be released can be selected by the test enable flag.

Figure 8-1. Interrupt Control Circuit Block Diagram

Notes 1. Noise eliminator (Standby release is disable when noise eliminator is selected.)

2. The INT2 pin is not provided. Interrupt request flag (IRQ2) is set at the KRn pin falling edge when IM20 = 1 and IM21 = 0.

9. STANDBY FUNCTION

In order to reduce power dissipation while a program is in a standby mode, two types of standby modes (STOP mode and HALT mode) are provided for the μPD754244.

Table 9-1. Operation Status in Standby Mode

Item \ Mode		STOP Mode	HALT Mode
Set instruction		STOP instruction	HALT instruction
Operation status	Clock generator	Operation stops.	Only the CPU clock Φ halts (oscillation continues).
	Basic interval timer/ watchdog timer	Operation stops.	Operable BT mode: The IRQBT is set in the basic time interval. WT mode: Reset is generated by the BT overflow.
	Timer	Operation stops.	Operable.
	External interrupt	INT0 is not operable. ^{Note} INT2 is operable during KRn falling period only.	
	CPU	The operation stops.	
Release signal		<ul style="list-style-type: none"> Reset signal Interrupt request signal sent from interrupt enabled peripheral hardware System reset signal (key return reset) generated by KRn falling edge when the KRREN pin = 1 	<ul style="list-style-type: none"> Reset signal Interrupt request signal sent from interrupt enabled peripheral hardware

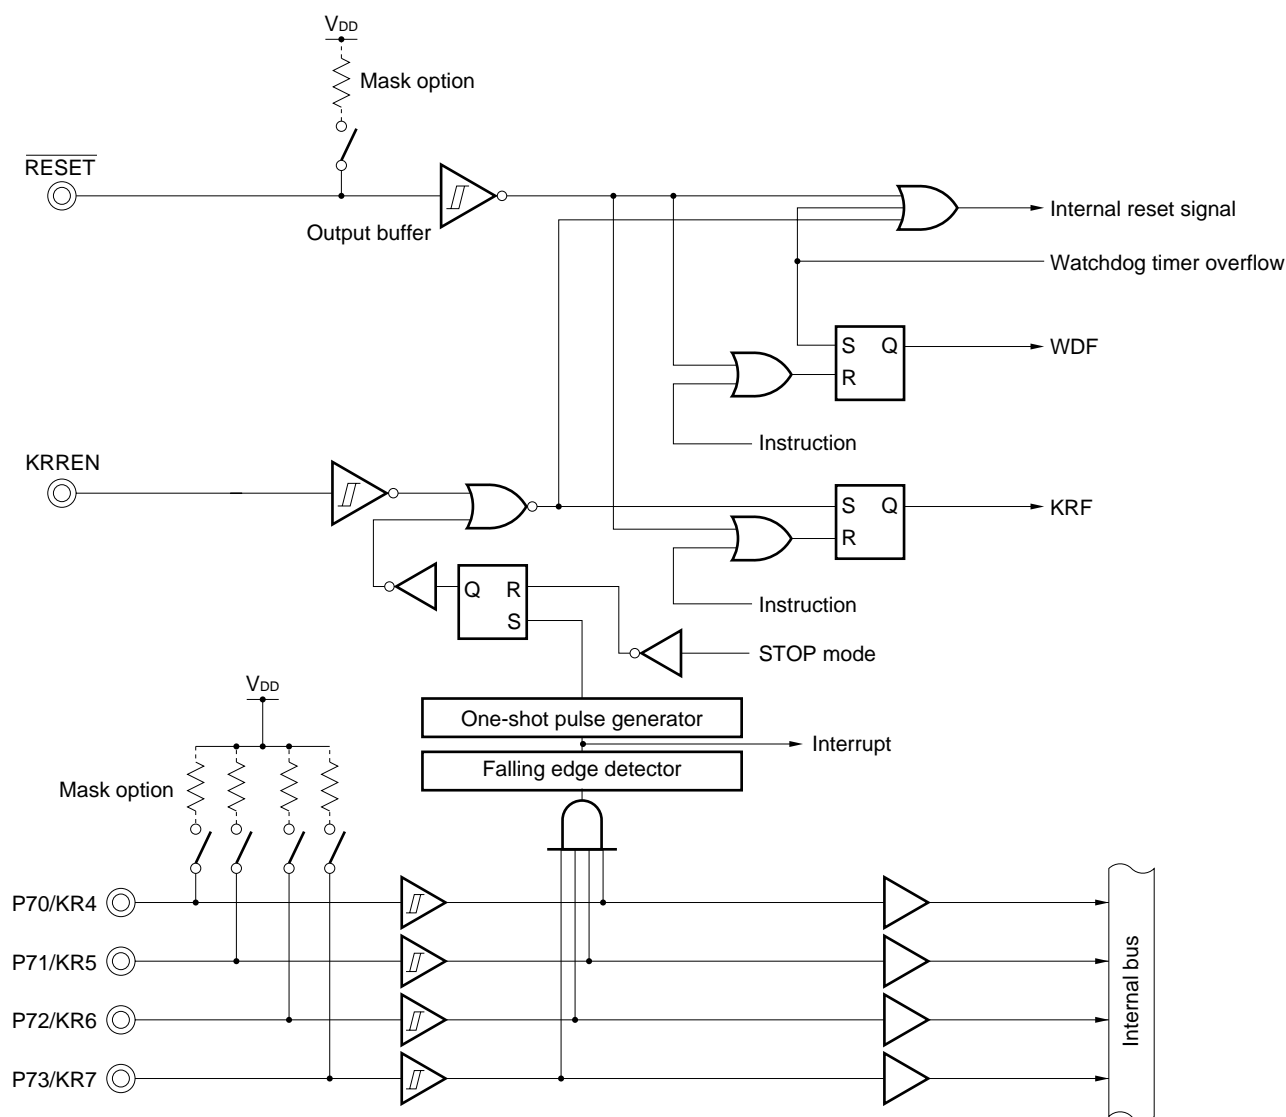

Note Can operate only when the noise eliminator is not used (IM02 = 1) by bit 2 of the edge detection mode register (IM0).

10. RESET FUNCTION

10.1 Configuration and Operation Status of RESET Function

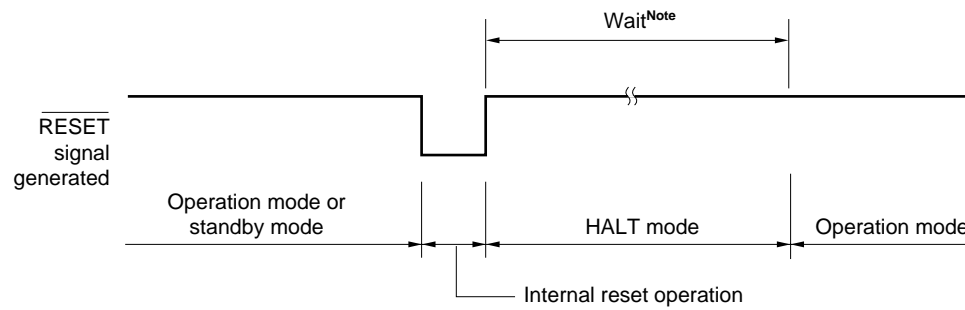

There are three kinds of reset input: the external reset signal ($\overline{\text{RESET}}$), the reset signal sent from the basic interval/watchdog timer, and the reset signal generated by a falling edge signal from KRn in the STOP mode. When any of these reset signals is input, an internal reset signal is generated. The configuration is shown in Figure 10-1.

Figure 10-1. Configuration of Reset Function

Each hardware is initialized by the $\overline{\text{RESET}}$ signal generation as listed in Table 10-1. Figure 10-2 shows the timing chart of the reset operation.

Figure 10-2. Reset Operation by $\overline{\text{RESET}}$ Signal Generation

Note In the μPD754144, the wait time is fixed to $56/f_{cc}$ ($56\mu\text{s}$: @ 1.0-MHz operation).
 In the μPD754244, the wait time can be selected from the following two time settings by means of the mask option.

- $2^{17}/f_x$ (21.8 ms : @ 6.0-MHz operation, 31.3 ms: @ 4.19-MHz operation)
- $2^{15}/f_x$ (5.46 ms : @ 6.0-MHz operation, 7.81 ms: @ 4.19-MHz operation)

Table 10-1. Hardware Status After Reset (1/3)

Hardware		RESET signal generation in the standby mode	RESET signal generation in operation
Program counter (PC)		Sets the low-order 4 bits of program memory's address 0000H to the PC11-PC8 and the contents of address 0001H to the PC7-PC0.	Sets the low-order 4 bits of program memory's address 0000H to the PC11-PC8 and the contents of address 0001H to the PC7-PC0.
PSW	Carry flag (CY)	Held	Undefined
	Skip flag (SK0 to SK2)	0	0
	Interrupt status flag (IST0, IST1)	0	0
	Bank enable flag (MBE, RBE)	Sets the bit 6 of program memory's address 0000H to the RBE and bit 7 to the MBE.	Sets the bit 6 of program memory's address 0000H to the RBE and bit 7 to the MBE.
Stack pointer (SP)		Undefined	Undefined
Stack bank select register (SBS)		1000B	1000B
Data memory (RAM)		Held	Undefined
Data memory (EEPROM)		Held ^{Note 1}	Held ^{Note 2}
EEPROM write control register (EWC)		0	0
General-purpose register (X, A, H, L, D, E, B, C)		Held	Undefined
Bank select register (MBS, RBS)		0, 0	0, 0
Basic interval timer/watchdog timer	Counter (BT)	Undefined	Undefined
	Mode register (BTM)	0	0
	Watchdog timer enable flag (WDTM)	0	0
Timer counter (channel 0)	Counter (T0)	0	0
	Modulo register (TMOD0)	FFH	FFH
	Mode register (TM0)	0	0
	TOE0, TOUT F/F	0, 0	0, 0
Timer counter (channel 1)	Counter (T1)	0	0
	Modulo register (TMOD1)	FFH	FFH
	Mode register (TM1)	0	0
	TOE1, TOUT F/F	0, 0	0, 0
Timer counter (channel 2)	Counter (T2)	0	0
	Modulo register (TMOD2)	FFH	FFH
	High-level period setting modulo register (TMOD2H)	FFH	FFH
	Mode register (TM2)	0	0
	TOE2, TOUT F/F	0, 0	0, 0
	REMC, NRZ, NRZB	0, 0, 0	0, 0, 0

Notes 1. Undefined if STOP mode is entered during an EEPROM write operation. Also undefined if HALT mode is entered during a write operation and a RESET signal is input during a write operation.

2. If a RESET signal is input during an EEPROM write operation, the data at that address is undefined.

Table 10-1. Hardware Status After Reset (2/3)

Hardware		$\overline{\text{RESET}}$ signal generation in the standby mode	$\overline{\text{RESET}}$ signal generation in operation
Programmable threshold port mode register (PTHM)		00H	00H
Clock generator	Processor clock control register (PCC)	0	0
Interrupt function	Interrupt request flag (IRQ $\times\times\times$)	Reset (0)	Reset (0)
	Interrupt enable flag (IE $\times\times\times$)	0	0
	Interrupt priority selection register (IPS)	0	0
	INT0, 2 mode registers (IM0, IM2)	0, 0	0, 0
Digital port	Output buffer	Off	Off
	Output latch	Cleared (0)	Cleared (0)
	I/O mode registers (PMGA, C)	0	0
	Pull-up resistor setting register (POGA, B)	0	0
Bit sequential buffer (BSB0-BSB3)		Held	Undefined

Table 10-1. Hardware Status After Reset (3/3)

Hardware	$\overline{\text{RESET}}$ signal generation by key return reset	$\overline{\text{RESET}}$ signal generation in the standby mode	$\overline{\text{RESET}}$ signal generation by WDT during operation	$\overline{\text{RESET}}$ signal generation during operation
Watchdog flag (WDF)	Hold the previous status	0	1	0
Key return flag (KRF)	1	0	Hold the previous status	0

10.2 Watchdog Flag (WDF), Key Return Flag (KRF)

The WDF is cleared by a watchdog timer overflow signal, and the KRF is set by a reset signal generated by the KRn pins. As a result, by checking the contents of WDF and KRF, it is possible to know what kind of reset signal is generated.

As the WDF and KRF are cleared only by external signal or instruction execution, if once these flags are set, they are not cleared until an external signal is generated or a clear instruction is executed. Check and clear the contents of WDF and KRF after reset start operation by executing SKTCLR instruction and so on.

Table 10-2 lists the contents of WDF and KRF corresponding to each signal. Figure 10-3 shows the WDF operation in generating each signal, and Figure 10-4 shows the KRF operation in generating each signal.

Table 10-2. WDF and KRF Contents Correspond to Each Signal

Hardware	External $\overline{\text{RESET}}$ signal generation	Reset signal generation by watchdog timer overflow	Reset signal generation by the KRn input	WDF clear instruction execution	KRF clear instruction execution
Watchdog flag (WDF)	0	1	Hold	0	Hold
Key return flag (KRF)	0	Hold	1	Hold	0

Figure 10-3. WDF Operation in Generating Each Signal

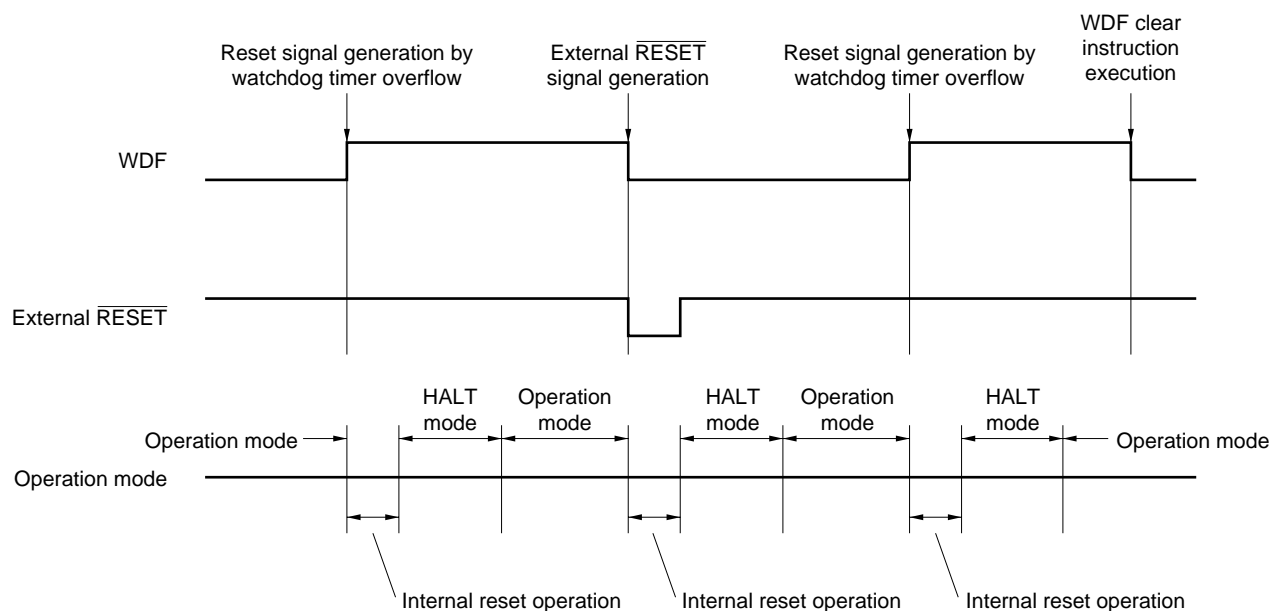

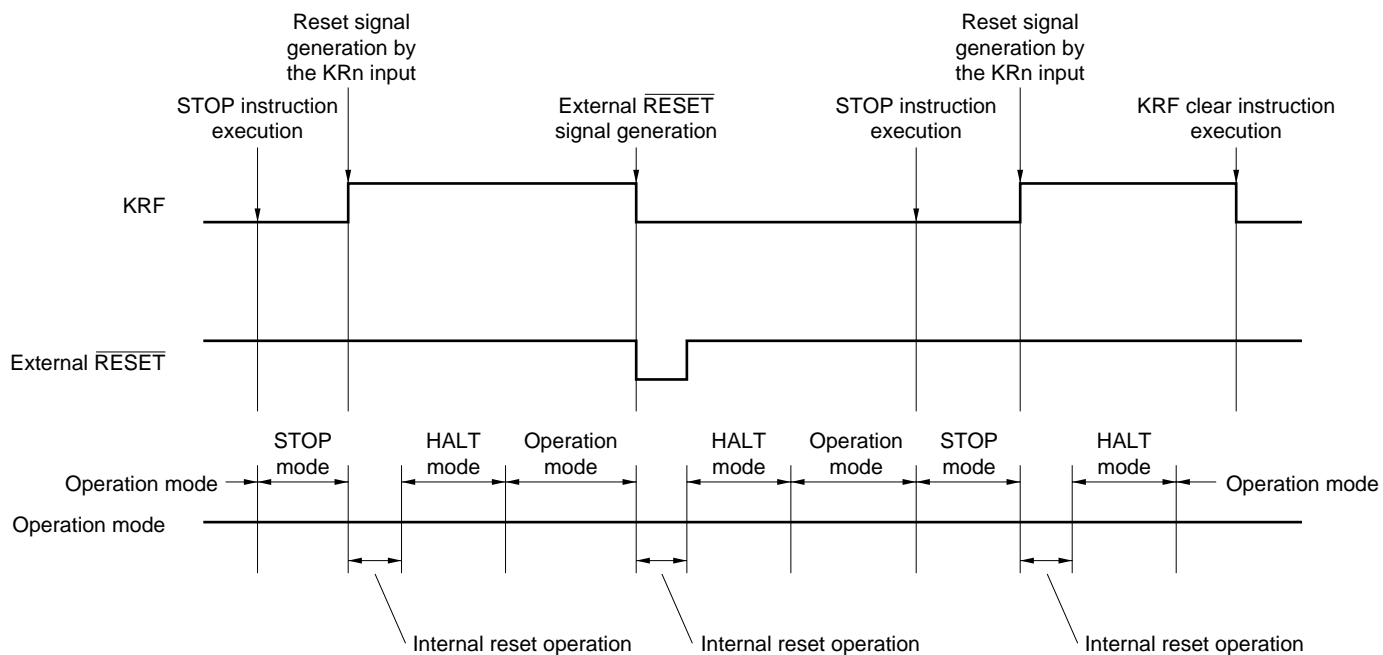

Figure 10-4. KRF Operation in Generating Each Signal

11. MASK OPTION

The μ PD754244 has the following mask options:

- Mask option of P70/KR4 to P73/KR7

On-chip pull-up resistor connection can be specified for these pins.

- (1) Do not connect an on-chip pull-up resistor
- (2) Connect the 100-k Ω (typ.) pull-up resistor bit-wise

- Mask option of $\overline{\text{RESET}}$ pin

On-chip pull-up resistor connection can be specified for this pin.

- (1) Do not connect an on-chip pull-up resistor
- (2) Connect the 100-k Ω (typ.) pull-up resistor

- Standby function mask option (μ PD754244 only) ^{Note}

The wait time when the $\overline{\text{RESET}}$ signal is input can be selected.

- (1) $2^{17}/f_X$ (21.8 ms: @ $f_X = 6.0\text{-MHz}$ operation, 31.3 ms: @ $f_X = 4.19\text{-MHz}$ operation)
- (2) $2^{15}/f_X$ (5.46 ms: @ $f_X = 6.0\text{-MHz}$ operation, 7.81 ms: @ $f_X = 4.19\text{-MHz}$ operation)

Note This mask option is not provided for the μ PD754144, and its wait time is fixed to $56/f_{CC}$ (56 μ s: @ $f_{CC} = 1.0\text{-MHz}$ operation).

12. INSTRUCTION SETS

(1) Expression formats and description methods of operands

The operand is described in the operand column of each instruction in accordance with the description method for the operand expression format of the instruction. For details, refer to “**RA75X ASSEMBLER PACKAGE USERS’ MANUAL — LANGUAGE (EEU-1367)**”. If there are several elements, one of them is selected. Capital letters and the + and – symbols are key words and are described as they are.

For immediate data, appropriate numbers and labels are described.

Instead of the labels such as mem, fmem, pmem, and bit, the symbols of the registers can be described.

However, there are restrictions in the labels that can be described for fmem and pmem. For details, refer to “**μPD754144, 754244 user's manual (U10676E)**”.

Expression format	Description method
reg	X, A, B, C, D, E, H, L
reg1	X, B, C, D, E, H, L
rp	XA, BC, DE, HL
rp1	BC, DE, HL
rp2	BC, DE
rp'	XA, BC, DE, HL, XA', BC', DE', HL'
rp'1	BC, DE, HL, XA', BC', DE', HL'
rpa	HL, HL+, HL–, DE, DL
rpa1	DE, DL
n4	4-bit immediate data or label
n8	8-bit immediate data or label
mem	8-bit immediate data or label ^{Note}
bit	2-bit immediate data or label
fmem	FB0H-FBFH, FF0H-FFFH immediate data or label
pmem	FC0H-FFFH immediate data or label
addr	000H-FFFH immediate data or label
addr1	000H-FFFH immediate data or label
caddr	12-bit immediate data or label
faddr	11-bit immediate data or label
taddr	20H-7FH immediate data (where bit 0 = 0) or label
PORTn	PORT3, 6, 7, 8
IExxx	IEBT, IET0-IET2, IE0, IE2, IEE
RBn	RB0-RB3
MBn	MB0, MB4, MB15

Note mem can be only used for even address in 8-bit data processing.

(2) Legend in explanation of operation

A	: A register, 4-bit accumulator
B	: B register
C	: C register
D	: D register
E	: E register
H	: H register
L	: L register
X	: X register
XA	: XA register pair; 8-bit accumulator
BC	: BC register pair
DE	: DE register pair
HL	: HL register pair
XA'	: XA' extended register pair
BC'	: BC' extended register pair
DE'	: DE' extended register pair
HL'	: HL' extended register pair
PC	: Program counter
SP	: Stack pointer
CY	: Carry flag, bit accumulator
PSW	: Program status word
MBE	: Memory bank enable flag
RBE	: Register bank enable flag
PORT _n	: Port n (n = 3, 6, 7, 8)
IME	: Interrupt master enable flag
IPS	: Interrupt priority selection register
IE _{xxx}	: Interrupt enable flag
RBS	: Register bank selection register
MBS	: Memory bank selection register
PCC	: Processor clock control register
.	: Separation between address and bit
(xx)	: The contents addressed by xx
xxH	: Hexadecimal data

(3) Explanation of symbols under addressing area column

*1	MB = MBE•MBS (MBS = 0, 4, 15)	Data memory addressing
*2	MB = 0	
*3	MBE = 0 : MB = 0 (000H to 07FH) MB = 15 (F80H to FFFH) MBE = 1 : MB = MBS (MBS = 0, 4, 15)	
*4	MB = 15, fmem = FB0H to FBFH, FF0H to FFFH	
*5	MB = 15, pmem = FC0H to FFFH	
*6	addr = 000H to FFFH	Program memory addressing
*7	addr = (Current PC) – 15 to (Current PC) – 1 (Current PC) + 2 to (Current PC) + 16 addr1 = (Current PC) – 15 to (Current PC) – 1 (Current PC) + 2 to (Current PC) + 16	
*8	caddr = 000H to FFFH	
*9	faddr = 0000H to 07FFH	
*10	taddr = 0020H to 007FH	
*11	addr1 = 000H to FFFH	

- Remarks**
1. MB indicates memory bank that can be accessed.
 2. In *2, MB = 0 independently of how MBE and MBS are set.
 3. In *4 and *5, MB = 15 independently of how MBE and MBS are set.
 4. *6 to *11 indicate the areas that can be addressed.

(4) Explanation of number of machine cycles column

S denotes the number of machine cycles required by skip operation when a skip instruction is executed. The value of S varies as follows.

- When no skip is made: S = 0
- When the skipped instruction is a 1- or 2-byte instruction: S = 1
- When the skipped instruction is a 3-byte instruction^{Note}: S = 2

Note 3-byte instruction: BR !addr, BRA !addr1, CALL !addr, or CALLA !addr1 instruction

Caution The GETI instruction is skipped in one machine cycle.

One machine cycle is equal to one cycle of CPU clock (= tcy); time can be selected from among four types by setting PCC.

Instruction group	Mnemonic	Operand	Number of bytes	Number of machine cycles	Operation	Addressing area	Skip condition
Transfer instruction	MOV	A, #n4	1	1	$A \leftarrow n4$		String effect A

13.1 μ PD754144

Absolute Maximum Ratings ($T_A = 25^\circ\text{C}$)

Parameter	Symbol	Test Conditions		Ratings	Unit
Power supply voltage	V_{DD}			-0.3 to +7.0	V
Input voltage	V_I			-0.3 to $V_{DD} + 0.3$	V
Output voltage	V_O			-0.3 to $V_{DD} + 0.3$	V
Output current, high	I_{OH}	Per pin	P30, P31, P33, P60 to P63, P80	-10	mA
			P32	-20	mA
		For all pins		-30	mA
Output current, low	I_{OL}	Per pin		20	mA
		For all pins		90	mA
Operating ambient temperature	T_A			-40 to +85	$^\circ\text{C}$
Storage temperature	T_{stg}			-65 to +150	$^\circ\text{C}$

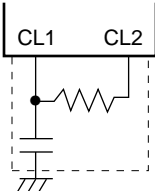

Caution If any of the parameters exceeds the absolute maximum ratings, even momentarily, the quality of the product may be impaired. The absolute maximum ratings are values that may physically damage the products. Be sure to use the products within the ratings.

Capacitance ($T_A = 25^\circ\text{C}$, $V_{DD} = 0\text{ V}$)

Parameter	Symbol	Test Conditions	MIN.	TYP.	MAX.	Unit
Input capacitance	C_{IN}	f = 1 MHz Unmeasured pins returned to 0 V			15	pF
Output capacitance	C_{OUT}				15	pF
I/O capacitance	C_{IO}				15	pF

- μ PD754144

System Clock Oscillator Characteristics ($T_A = -40$ to $+85$ °C, $V_{DD} = 1.8$ to 6.0 V)

Resonator	Recommended Constant	Parameter	Testing Conditions	MIN.	TYP.	MAX.	Unit
RC oscillator		Oscillation frequency (f_{cc}) Note		0.4		2.0	MHz

Note Only the oscillator characteristics are shown. For the instruction execution time and oscillation frequency characteristics, refer to **AC Characteristics**.

Caution When using the oscillation circuit of the system clock, wire the portion enclosed in dotted lines in the figures as follows to avoid adverse influences on the wiring capacitance:

- Keep the wire length as short as possible.
- Do not cross other signal lines.
- Do not route the wiring in the vicinity of lines through which a high fluctuating current flows.
- Always keep the ground point of the capacitor of the oscillation circuit as the same potential as V_{SS} .
- Do not connect the power source pattern through which a high current flows.
- Do not extract signals from the oscillation circuit.

Output capacitance	C _{OUT}	Unmeasured pins returned to 0 V			15	pF
I/O capacitance	C _{IO}				15	pF

• μPD754244

System Clock Oscillator Characteristics (T_A = -40 to +85°C, V_{DD} = 1.8 to 6.0 V)

Resonator	Recommended Constant	Parameter	Testing Conditions	MIN.	TYP.	MAX.	Unit
Ceramic resonator		Oscillation frequency (f _x) ^{Note1}		1.0		6.0 ^{Notes2, 3, 4}	MHz
		Oscillation stabilization time ^{Note 5}	After V _{DD} reaches MIN. value of oscillation voltage range			4	ms
Crystal resonator		Oscillation frequency(f _x) ^{Note1}		1.0		6.0 ^{Notes2, 3, 4}	MHz
		Oscillation stabilization time ^{Note3}	V _{DD} = 4.5 to 6.0 V			10	ms
						30	ms
External clock		X1 input frequency (f _x) ^{Note1}		1.0		6.0 ^{Notes2, 3, 4}	MHz
		X1 input high- and low-level widths (t _{xH} , t _{xL})		83.3		500	ns

Notes 1. Only the oscillator characteristics are shown. For the instruction execution time, refer to **AC Characteristics**.

- If the oscillation frequency is 2.1 MHz < f_x ≤ 4.19 MHz at 1.8 V ≤ V_{DD} < 2.0 V, set the processor control register (PCC) to a value other than 0011. If the PCC is set to 0011, the rated machine cycle time of 1.9 μs is not satisfied.
- If the oscillation frequency is 4.19 MHz < f_x ≤ 6.0 MHz at 1.8 V ≤ V_{DD} < 2.0 V, set the processor control register (PCC) to a value other than 0011 or 0010. If the PCC is set to 0011 or 0010, the rated machine cycle time of 1.9 μs is not satisfied.
- If the oscillation frequency is 4.19 MHz < f_x ≤ 6.0 MHz at 2.0 V ≤ V_{DD} < 2.7 V, set the processor control register (PCC) to a value other than 0011. If the PCC is set to 0011, the rated machine cycle time of 0.95 μs is not satisfied.
- Oscillation stabilization time is a time required for oscillation to stabilize after application of V_{DD}, or after the STOP mode has been released.

Caution When using the oscillation circuit of the system clock, wire the portion enclosed in dotted lines in the figures as follows to avoid adverse influences on the wiring capacitance:

- Keep the wire length as short as possible.
- Do not cross other signal lines.
- Do not route the wiring in the vicinity of lines through which a high fluctuating current flows.
- Always keep the ground point of the capacitor of the oscillation circuit as the same potential as V_{ss}.
- Do not connect the power source pattern through which a high current flows.
- Do not extract signals from the oscillation circuit.

Note When using the CSB1000J (1.0 MHz) made by Murata Mfg. Co., Ltd. as a ceramic resonator, a limiting resistor ($R_d = 2.2 \text{ k}\Omega$) is necessary (refer to the figure below). This resistor is not necessary when using the other recommended resonators.

Caution The oscillator constants and oscillation voltage range indicate conditions for stable oscillation, but do not guarantee oscillation frequency accuracy. If oscillation frequency accuracy is required for actual circuits, it is necessary to adjust the oscillation frequency of the oscillator in the actual circuit. Please contact directly the manufacturer of the resonator to be used.

- Notes 1.** The CPU clock (Φ) cycle time (minimum instruction execution time) is determined by the oscillation frequency of the connected resonator (or external clock) and the processor clock control register (PCC). The figure on the right shows the cycle time t_{CY} characteristics against the supply voltage V_{DD} when the system clock is used.
- 2.** $2t_{CY}$ or $128/f_x$ depending on the setting of the interrupt mode register (IM0).

• μPD754244

EEPROM Characteristics (T_A = -40 to +85°C, V_{DD} = 1.8 to 6.0 V)

Parameter	Symbol	Conditions		MIN.	TYP.	MAX.	Unit
EEPROM write current	I _{EEW}	4.19 MHz, crystal oscillation	V _{DD} = 5.0 V ± 10%		4.5	15	mA
			V _{DD} = 3.0 V ± 10%		2.0	6	mA
EEPROM write time	t _{EEW}			3.8		10.0	ms
EEPROM write times	EEWT	T _A = -40 to +70°C		100000			times/byte
		T _A = -40 to +85°C		80000			times/byte

Comparator Characteristics (T_A = -40 to +85°C, V_{DD} = 1.8 to 6.0 V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Comparison accuracy	V _{ACOMP}				±100	mV
Threshold voltage	V _{TH}		Note		Note	V
PTH input voltage	V _{IPTH}		0		V _{DD}	V
AV _{REF} input voltage	V _{IAVREF}		1.8		V _{DD}	V
Comparator circuit current consumption	I _{DD5}	When bit 7 of PTHM is set to 1		1		mA

Note The threshold voltage becomes as follows by settings bits 0 to 3 of PTHM.
 $V_{TH} = V_{IAVREF} \times (n + 0.5)/16$ (n = 0 to 15)

17. RECOMMENDED SOLDERING CONDITIONS

Solder the μPD754244 under the following recommended conditions.

For the details on the recommended soldering conditions, refer to Information Document “**Semiconductor Device Mounting Technology Manual (C10535E)**”.

For the soldering method and conditions other than those recommended, consult an NEC representative.

Table 17-1. Soldering Conditions of Surface Mount Type (1/2)

(1) μPD754244GS-xxx-GJG: 20-pin plastic shrink SOP (300 mil, 0.65-mm pitch)

Soldering Method	Soldering Conditions	Symbol
Infrared ray reflow	Package peak temperature: 235°C, Reflow time: 30 seconds max. (210°C min.), Number of reflow process: 2 max.	IR35-00-2
VPS	Package peak temperature: 215°C, Reflow time: 40 seconds max. (200°C min.), Number of reflow process: 2 max.	VP15-00-2
Wave soldering	Solder bath temperature: 260°C max., Flow time: 10 seconds max., Number of flow process: 1 Preheating temperature: 120°C max. (package surface temperature)	WS60-00-1
Partial heating	Pin temperature: 300°C max., Time: 3 seconds max. (per side of device)	—

Caution Do not use different soldering methods together (except for partial heating).

(2) μPD754144GS-xxx-GJG: 20-pin plastic shrink SOP (300 mil, 0.65-mm pitch)

Soldering Method	Soldering Conditions	Symbol
Infrared ray reflow	Package peak temperature: 235°C, Reflow time: 30 seconds max. (210°C min.), Number of reflow process: 3 max.	IR35-00-3
VPS	Package peak temperature: 215°C, Reflow time: 40 seconds max. (200°C min.), Number of reflow process: 3 max.	VP15-00-3
Wave soldering	Solder bath temperature: 260°C max., Flow time: 10 seconds max., Number of flow process: 1 Preheating temperature: 120°C max. (package surface temperature)	WS60-00-1
Partial heating	Pin temperature: 300°C max., Time: 3 seconds max. (per side of device)	—

Caution Do not use different soldering methods together (except for partial heating).

Table 17-1. Soldering Conditions of Surface Mount Type (2/2)

(3) μPD754144GS-xxx-BA5: 20-pin plastic SOP (300 mil, 1.27-mm pitch)

μPD754244GS-xxx-BA5: 20-pin plastic SOP (300 mil, 1.27-mm pitch)

Soldering Method	Soldering Conditions	Symbol
Infrared ray reflow	Package peak temperature: 235°C, Reflow time: 30 seconds max. (210°C min.), Number of reflow process: 2 max. Exposure limit: 7 days ^{Note} (afterward, 10-hour pre-baking at 125°C is required)	IR35-107-2
VPS	Package peak temperature: 215°C, Reflow time: 40 seconds max. (200°C min.), Number of reflow process: 2 max. Exposure limit: 7 days ^{Note} (afterward, 10-hour pre-baking at 125°C is required)	VP15-107-2
Wave soldering	Solder bath temperature: 260°C max., Flow time: 10 seconds max., Number of flow process: 1 Preheating temperature: 120°C max. (package surface temperature) Exposure limit: 7 days ^{Note} (afterward, 10-hour pre-baking at 125°C is required)	WS60-107-1
Partial heating	Pin temperature: 300°C max., Time: 3 seconds max. (per side of device)	—

Note Maximum number of days during which the product can be stored at a temperature of 25°C and a relative humidity of 65% or less after dry-pack package is opened.

Caution Do not use different soldering methods together (except for partial heating).

APPENDIX A. COMPARISON OF FUNCTIONS AMONG μ PD754144, 754244, AND 75F4264

Item		μ PD754144	μ PD754244	μ PD75F4264 ^{Note}
Program memory		Mask ROM 0000H to 0FFFH (4096 x 8 bits)		Flash memory 0000H to 0FFFH (4096 x 8 bits)
Data memory	Static RAM	000H to 07FH (128 x 4 bits)		
	EEPROM	400H to 41FH (16 x 8 bits)		400H to 43FH (32 x 8 bits)
CPU		75XL CPU		
General-purpose register		(4 bits x 8 or 8 bits x 4) x 4 banks		
Instruction execution time		• 4, 8, 16, 64 μ s (@ f_{cc} = 1.0-MHz operation)	• 0.67, 1.33, 2.67, 10.7 μ s (@ f_x = 6.0-MHz operation) • 0.95, 1.91, 3.81, 15.3 μ s (@ f_x = 4.19-MHz operation)	
I/O port	CMOS input	4 (on-chip pull-up resistor can be connected by mask option)		
	CMOS I/O	9 (on-chip pull-up resistor connection can be specified by means of software)		
	Total	13		
System clock oscillator		RC oscillator (resistor and capacitor are connected externally)	Ceramic/crystal oscillator	
Start-up time after reset		$56/f_{cc}$	$2^{17}/f_x$, $2^{15}/f_x$ (can be selected by mask option)	$2^{15}/f_x$
Standby mode release time		$2^9/f_{cc}$	$2^{20}/f_x$, $2^{17}/f_x$, $2^{15}/f_x$, $2^{13}/f_x$ (can be selected by the setting of BTM)	
Timer		4 channels • 8-bit timer counter: 3 channels (can be used as 16-bit timer counter) • Basic interval timer/watchdog timer: 1 channel		
A/D converter		None		• 8-bit resolution x 2 channels (successive approximation, hardware control) • Can be operated from V_{DD} = 1.8 V
Programmable threshold port		2 channels		
Vectored interrupt		External: 1, internal: 5		
Test input		External: 1 (key return reset function available)		
Power supply voltage		V_{DD} = 1.8 to 6.0 V		
Operating ambient temperature		T_A = -40 to +85°C		
Package		• 20-pin plastic SOP (300 mil, 1.27-mm pitch) • 20-pin plastic shrink SOP (300 mil, 0.65-mm pitch)		• 20-pin plastic SOP (300 mil, 1.27-mm pitch)

Note Under development

APPENDIX B DEVELOPMENT TOOLS

The following development tools are provided for system development using the μPD754244.

In the 75XL series, the relocatable assembler which is common to the series is used in combination with the device file of each product.

Language processor

RA75X relocatable assembler	Host machine	OS	Distribution media	Part number (product name)
	PC-9800 series	MS-DOS™	3.5-inch 2HD	μS5A13RA75X
		(Ver. 3.30 to Ver. 6.2 ^{Note})	5-inch 2HD	μS5A10RA75X
	IBM PC/AT™ and compatible machines	Refer to “OS for IBM PC”	3.5-inch 2HC	μS7B13RA75X
			5-inch 2HC	μS7B10RA75X

Device file	Host machine	OS	Distribution media	Part number (product name)
	PC-9800 series	MS-DOS	3.5-inch 2HD	μS5A13DF754244
		(Ver. 3.30 to Ver. 6.2 ^{Note})	5-inch 2HD	μS5A10DF754244
	IBM PC/AT and compatible machines	Refer to “OS for IBM PC”	3.5-inch 2HC	μS7B13DF754244
			5-inch 2HC	μS7B10DF754244

Note Ver.5.00 or later have the task swap function, but it cannot be used for this software.

Remark Operation of the assembler and device file are guaranteed only on the above host machine and OSs.

Debugging tool

The in-circuit emulators (IE-75000-R and IE-75001-R) are available as the program debugging tool for the μPD754244.

The system configurations are described as follows.

Hardware	IE-75000-R ^{Note 1}	In-circuit emulator for debugging the hardware and software when developing application systems that use the 75X series and 75XL series. When developing the μPD754244, the emulation board IE-75300-R-EM and emulation probe EP-754144GS-R that are sold separately must be used with the IE-75000-R. By connecting with the host machine, efficient debugging can be made. It contains the emulation board IE-75000-R-EM which is connected.		
	IE-75001-R	In-circuit emulator for debugging the hardware and software when developing application systems that use the 75X series and 75XL series. When developing the μPD754244, the emulation board IE-75300-R-EM and emulation probe EP-754144GS-R which are sold separately must be used with the IE-75001-R. By connecting the host machine, efficient debugging can be made.		
	IE-75300-R-EM	Emulation board for evaluating the application systems that use the μPD754244. It must be used with the IE-75000-R or IE-75001-R.		
	EP-754144GS-R	Emulation probe for the μPD754244GS. It must be connected to IE-75000-R (or IE-75001-R) and IE-75300-R-EM. It is supplied with the flexible boards EV-9500GS-20 (supporting 20-pin plastic shrink SOPs) and EV-9501GS-20 (supporting 20-pin plastic SOPs) which facilitate connection to a target system.		
Software	IE control program	Connects the IE-75000-R or IE-75001-R to a host machine via RS-232-C and Centronix I/F and controls the above hardware on a host machine.		
		Host machine	OS	Part No. (product name)
		PC-9800 series	MS-DOS	3.5-inch 2HD
			(Ver. 3.30 to Ver. 6.2 ^{Note 2})	5-inch 2HD
		IBM PC/AT and its compatible machine	Refer to "OS for IBM PC"	3.5-inch 2HC
				5-inch 2HC

Notes 1. Maintenance parts

2. Ver.5.00 or later have the task swap function, but it cannot be used for this software.

Remark Operation of the IE control program is guaranteed only on the above host machines and OSs.

OS for IBM PC

The following IBM PC OS's are supported.

OS	Version
PC DOS™	Ver. 5.02 to Ver. 6.3 J6.1/V ^{Note} to J6.3/V ^{Note}
MS-DOS	Ver. 5.0 to Ver. 6.22 5.0/V ^{Note} to J6.2/V ^{Note}
IBM DOS™	J5.02/V ^{Note}

Note Supported only English mode.

Caution Ver. 5.0 and later have the task swap function, but it cannot be used for operating systems above.

APPENDIX C. RELATED DOCUMENTS

The related documents indicated in this publication may include preliminary versions. However, preliminary versions are not marked as such.

[MEMO]

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

[MEMO]

The μPD754244 is manufactured and sold based on a licence contract with CP8 Transac regarding the EEPROM microcomputer patent.

This product cannot be used for an IC card (SMART CARD).

The export of this product from Japan is regulated by the Japanese government. To export this product may be prohibited without governmental license, the need for which must be judged by the customer. The export or re-export of this product from a country other than Japan may also be prohibited without a license from that country. Please call an NEC sales representative.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.

M4 96.5

EEPROM is a trademark of NEC Corporation.

MS-DOS is either a registered trademark or a trademark of Microsoft Corporation in the United States and/or other countries.
