

High Power 53mm Silicon Controlled Rectifier

1300 A / 2200 V

C701

AMPLIFYING GATE

The C701 Reverse Blocking Thyristor now has extended voltage blocking capability through unique multi-diffusion processing of 53 mm nominal silicon without sacrificing essential ratings and characteristics.

The C701 is designed specifically for phase control applications like DC motor control, power supplies, cycloconverters and load commutated inverters.

FEATURES

- Optimized pilot gate for high di/dt rating
- Excellent withstand to high dv/dt voltage fronts
- Enhanced surge and I²t ratings for fuse coordination
- Glazed-fluted ceramic with metal — metal welded seal 1.0 in., 25.4 mm creepage
1/8 in., 15.9 mm clearance

SUPPRESSIBLE SURGE CURRENT TEST

Thyristor Gate Impedance

- This is enhanced by fast rising gate voltage, increasing anode bias and temperature.
- It is shown at a minimum for dc voltage, zero bias and low temperature.
- It is shown at a maximum for operating bias and recommended gate drive.

Gate Supply

- The short circuit current rise time should be approximately $0.5\mu s$ and the duration longer than the delay time expected for the thyristor.

Minimum Acceptable Gate Current

- The intersection of load line and gate characteristic (encircled) indicates the minimum value of actual current flowing into the gate that is required during the delay time interval needed for the published di/dt and snubber discharge ratings.

JUNCTION-TO-HEATSINK

NOTES:

1. Add $.006^\circ C/W$ to account for both case to dissipator interfaces when properly mounted; e.g., $R_{\theta JS} = .029^\circ C/W$. See Mounting Instructions.
2. DC Thermal Impedance is based on average full cycle junction temperature. Instantaneous junction temperature may be calculated using the following modifications:
 - end-of conducting portion of cycle
 - 120° sq. wave add $.0025^\circ C/W$ along entire curve
 - 180° sq. wave add $.0018^\circ C/W$ along entire curve
 - 180° sine wave add $.0010^\circ C/W$ along entire curve
 - end of full cycle
 - any wave, subtract $.001^\circ C/W$ along entire curve.

NOTES:

Code: --- Non-Repetitive High Gate Drive
 ——— Repetitive High Gate Drive

High Gate Drive

Source 20V/10 ohms
 Pulse Width, t_p $\geq 10 \mu s$
 Current Rise Time, t_r $\leq 0.5 \mu s$

*Permissible circuit di/dt excluding snubber discharge. Repetitive di/dt is SPCO recommended maximum condition to achieve most industrial requirements for service life. It meets or exceeds the JEDEC test requirements for certification set forth in NEMA Std. Sk. 516 (1972). Non-repetitive di/dt meets the JEDEC 5 second rating.

**Snubber discharge, i_s , is treated separately using the minimum value of snubber resistance indicated. This applies for long industrial life (20 – 30 years) in combination with circuit di/dt .
