#### ■ DESCRIPTION

The MB90F243 is a 16-bit microcontroller optimized for applications in mechatronics such as HDD units. The architecture of the MB90F243 is based on the MB90242A, and embedded with a 128-Kbyte flash memory.

The instruction set is based on the AT architecture of the F<sup>2</sup>MC-16 and 16H family, with additional high-level language supporting instruction, expanded addressing modes, enhanced multiplication and division instructions, and improved bit processing instructions. In addition, long-word data can now be processed due to the inclusion of a 32-bit accumulator.

The MB90F243 includes a variety of peripherals on chip, such as the device is equipped with 6-channel 8/10-bit A/D converter, UART, 3-channel 16-bit reload timers, 1-channel 16-bit timer, 4-channel 16-bit input capture and 4-channel DTP/external interrupts.

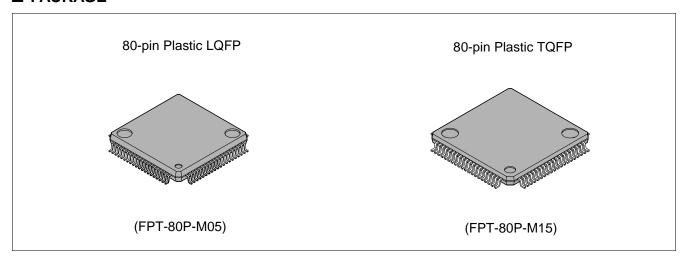

\*: F2MC stands for FUJITSU Flexible Microcontroller.

#### **■ FEATURES**

• Minimum execution time: 62.5 ns at 32 MHz oscillation

Instruction set optimized for controller applications

Variety of data types: bit, byte, word, long-word

Expanded addressing modes: 25 types

High coding efficiency

Improvement of high-precision arithmetic operations through use of 32-bit accumulator Enhanced multiplication and division instructions (signed arithmetic operations)

• Instruction set supports high-level language (C language) and multitasking

Inclusion of system stack pointer

Variety of pointers

High instruction set symmetry

Barrel shift instruction

Stack clock function

- Improved execution speed: 8-byte queue
- · Powerful interrupt functions

Interrupt processing time: 1.0 µs at 32 MHz oscillation

Priority levels: 8 levels (programmable) External interrupt inputs: 4 channels

· Automatic transfer function independent of CPU

Extended intelligent I/O Service: max.15 channels

128-Kbyte flash memory

Access time (min.): 120 ns

Sector structure of  $16K + 512 \times 2 + 7K + 8K + 32K + 64K$ 

Program/erase operations from both programmers and CPUs through built-in flash memory interface circuit Built-in program booster

• Internal RAM: 1 Kbyte

According to mode settings, data stored on RAM can be executed as CPU instructions.

• General-purpose ports: max. 62 channels (single-chip mode)

max. 38 channels (external bus mode)

- 18-bit timebase timer
- Watchdog timer
- UART: 8 bits × 1 channel
- 8/16-bit I/O simple serial interface (max. 8 Mbps): 1 channel
- 8/10-bit A/D converter: analog inputs: 6 channels

Resolution: 10 bits (switchable to 8 bits)

Conversion time: min. 1.25 µs

Conversion result store register: 4 channels

- 16-bit free-run timer: 1 channel (operating clock: 0.25 μs)
- 16-bit input capture: 4 channels
- 16-bit reload timer: 3 channels
- Low-power consumption modes

Sleep mode

Stop mode

Hardware standby mode

- Packages: LQFP-80, TQFP-80
- · CMOS technology

#### **■ I/O CIRCUIT TYPE**

#### (Continued)

#### **■ HANDLING DEVICES**

#### 1. Preventing Latchup

Latchup may occur on CMOS ICs if voltage higher than Vcc or lower than Vss is applied to the input or output pins other than medium-and high-voltage pins or if higher than the voltage which shown on "■ Absolute Maximum Ratings" is applied between Vcc and Vss.

When latchup occurs, power supply current increases rapidly might thermally damage elements. When using, take great care not to exceed the absolute maximum ratings.

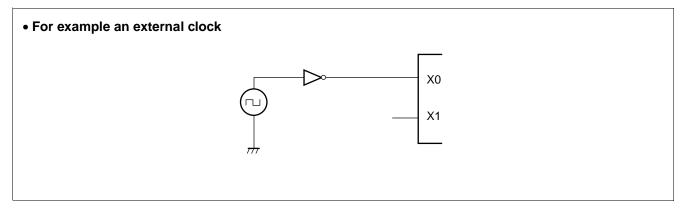

In addition, for the same reasons take care to prevent the analog power supply from exceeding the digital power supply.

#### 2. Treatment of Unused Pins

Leaving unused input pins open could cause malfunctions. They should be connected to a pull-up or pull-down resistors.

#### 3. Precautions when Using an External Clock

When an external clock is used, drive X0 only.

#### 4. Power Supply Pins

When there are several Vcc and Vss pins, those pins that should have the same electric potential are connected within the device when the device is designed in order to prevent misoperation, such as latch-up. However, all of those pins must be connected to the power supply and ground externally in order to reduce unnecessary emissions, prevent misoperation of strobe signals due to an increase in the ground level, and to observe the total output current standards.

In addition, give a due consideration to the connection in that current supply be connected to Vcc and Vss with the lowest possible impedance.

Finally, it is recommended to connect a capacitor of about 0.1  $\mu$ F between  $V_{CC}$  and  $V_{SS}$  near this device as a bypass capacitor.

#### 5. Crystal Oscillation Circuit

Noise in the vicinity of the X0 and X1 pins will cause this device to operate incorrectly. Design the printed circuit board so that the bypass capacitor connecting X0 and X1 pins and the crystal oscillator (or ceramic oscillator) to ground is located as close to the device as possible.

In addition, because printed circuit board artwork in which the area around the X0 and X1 pins is surrounded by ground provides stable operation, such an arrangement is strongly recommended.

#### 6. Sequence for Applying the A/D Converter Power Supply and the Analog Inputs

Always be sure to apply the digital power supply (Vcc) before applying the A/D converter power supply (AVcc, AVRH, and AVRL) and the analog inputs (AN0 to AN7).

In addition, when the power is turned off, turn off the A/D converter power supply and the analog inputs first, and then turn off the digital power supply. (Turning on or off the analog and digital power supplies simultaneously will not cause any problems.)

Whether applying or cutting off the power, be certain that AVRH does not exceed AVcc.

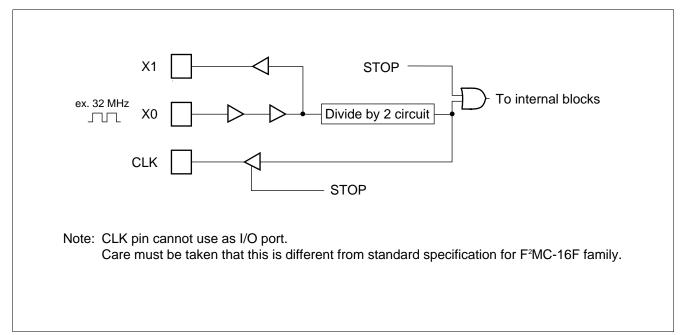

#### 7. External Reset Input

To reliably reset the controller by inputting an "L" level to the  $\overline{RST}$  pin, ensure that the "L" level is applied for at least five machine cycles.

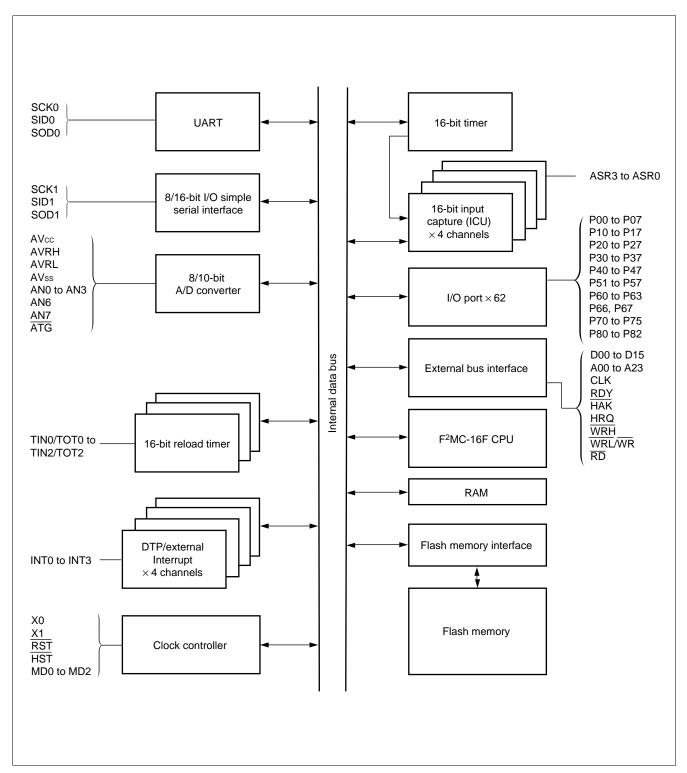

#### 8. HST Pin

When turning on the system, be sure to set the  $\overline{HST}$  pin to "H" level. Never set the  $\overline{HST}$  pin to "L" level while the  $\overline{RST}$  pin is in "L" level.

#### Explanation of read/write

R/W: Readable and writable

R: Read only W: Write only

#### Explanation of initial values

- 0: The initial value of this bit is "0".
- 1: The initial value of this bit is "1".
- X: The initial value of this bit is undefined.
- -: This bit is unused. No initial value is defined.
- \*1: Access prohibited.
- \*2: The initial values are changed depending on a bus mode.
- \*3: The only area available for the external access below address 0000FFH is this area. Addresses not explained in the table are "(reserved area)"; accesses to these areas are handled accesses to internal areas. No access signal is generated for the external bus.

Note: Do not use any "(Vacancy)".

WARNING: Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representative beforehand.

#### 7. A/D Converter Glossary

Resolution

Analog changes that are identifiable with the A/D converter.

When the number of bits is 10, analog voltage can be divide into 210.

Linearity error

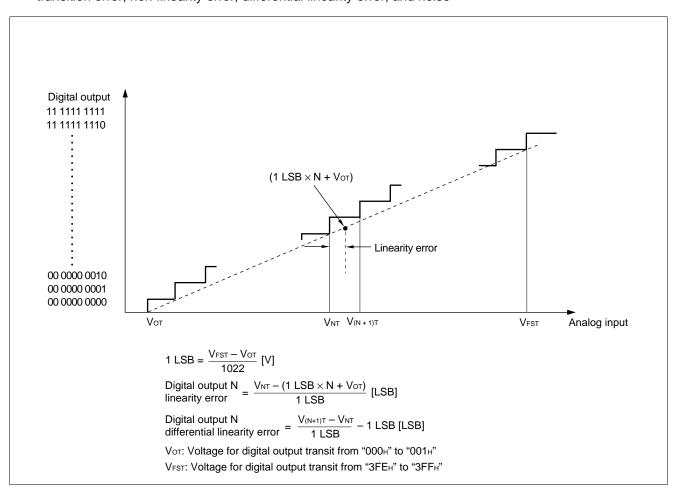

The deviation of the straight line connecting the zero transition point ("00 0000 0000"  $\leftrightarrow$  "00 0000 0001") with the full-scale transition point ("11 1111 1110"  $\leftrightarrow$  "11 1111 1111") from actual conversion characteristics

Differential linearity error

The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value

Total error (unit: LSB)

The difference between theoretical and actual conversion values caused by the zero transition error, full-scale transition error, non-linearity error, differential linearity error, and noise

### ■ INSTRUCTION SET (412 INSTRUCTIONS)

Table 1 Explanation of Items in Table of Instructions

Item	Explanation
Mnemonic	Upper-case letters and symbols: Represented as they appear in assembler Lower-case letters: Replaced when described in assembler. Numbers after lower-case letters: Indicate the bit width within the instruction.
#	Indicates the number of bytes.
~	Indicates the number of cycles. See Table 4 for details about meanings of letters in items.
В	Indicates the correction value for calculating the number of actual cycles during execution of instruction.  The number of actual cycles during execution of instruction is summed with the value in the "cycles" column.
Operation	Indicates operation of instruction.
LH	Indicates special operations involving the bits 15 through 08 of the accumulator.  Z: Transfers "0".  X: Extends before transferring.  —: Transfers nothing.
АН	Indicates special operations involving the high-order 16 bits in the accumulator.  *: Transfers from AL to AH.  —: No transfer.  Z: Transfers 00H to AH.  X: Transfers 00H or FFH to AH by extending AL.
I	Indicates the status of each of the following flags: I (interrupt enable), S (stack), T (sticky
S	bit), N (negative), Z (zero), V (overflow), and C (carry).  *: Changes due to execution of instruction.
Т	—: No change.
N	S: Set by execution of instruction. R: Reset by execution of instruction.
Z	
V	
С	
RMW	Indicates whether the instruction is a read-modify-write instruction (a single instruction that reads data from memory, etc., processes the data, and then writes the result to memory.).  *: Instruction is a read-modify-write instruction —: Instruction is not a read-modify-write instruction Note: Cannot be used for addresses that have different meanings depending on whether they are read or written.

Table 2 Explanation of Symbols in Table of Instructions

Symbol	Explanation
А	32-bit accumulator The number of bits used varies according to the instruction. Byte: Low order 8 bits of AL Word: 16 bits of AL Long: 32 bits of AL, AH
AH	High-order 16 bits of A
AL	Low-order 16 bits of A
SP	Stack pointer (USP or SSP)
PC	Program counter
SPCU	Stack pointer upper limit register
SPCL	Stack pointer lower limit register
PCB	Program bank register
DTB	Data bank register
ADB	Additional data bank register
SSB	System stack bank register
USB	User stack bank register
SPB	Current stack bank register (SSB or USB)
DPR	Direct page register
brg1	DTB, ADB, SSB, USB, DPR, PCB, SPB
brg2	DTB, ADB, SSB, USB, DPR, SPB
Ri	R0, R1, R2, R3, R4, R5, R6, R7
RWi	RW0, RW1, RW2, RW3, RW4, RW5, RW6, RW7
RWj	RW0, RW1, RW2, RW3
RLi	RL0, RL1, RL2, RL3
dir addr16 addr24 addr24 0 to 15 addr24 16 to 23	Compact direct addressing Direct addressing Physical direct addressing Bits 0 to 15 of addr24 Bits 16 to 23 of addr24
io	I/O area (000000н to 0000FFн)

All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).
CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
