

÷4 Divider

The MC10EL/100EL33 is an integrated ÷4 divider. The differential clock inputs and the V_{BB} allow a differential, single-ended or AC coupled interface to the device. If used, the V_{BB} output should be bypassed to ground with a 0.01μF capacitor. Also note that the V_{BB} is designed to be used as an input bias on the EL33 only, the V_{BB} output has limited current sink and source capability.

The reset pin is asynchronous and is asserted on the rising edge. Upon power-up, the internal flip-flops will attain a random state; the reset allows for the synchronization of multiple EL33's in a system.

- 650ps Propagation Delay
- 4.0GHz Toggle Frequency
- High Bandwidth Output Transitions
- 75kΩ Internal Input Pulldown Resistors
- >1000V ESD Protection
