MT58L64L36D

**3.3V V_{DD}, 3.3V I/O, Pipelined, Double-Cycle
Deselect**

FEATURES

- Fast clock and OE# access times
- Single +3.3V +0.3V/-0.165V power supply (V_{DD})
- Separate +3.3V isolated output buffer supply (V_{DDQ})
- SNOOZE MODE for reduced-power standby
- Common data inputs and data outputs
- Individual BYTE WRITE control and GLOBAL WRITE
- Three chip enables for simple depth expansion and address pipelining
- Clock-controlled and registered addresses, data I/Os and control signals
- Internally self-timed WRITE cycle
- Burst control pin (interleaved or linear burst)
- Automatic power-down
- 100-pin TQFP package
- Low capacitive bus loading
- x18, x32, and x36 options available

OPTIONS

- Timing (Access/Cycle/MHz)

GENERAL DESCRIPTION

The Micron® SyncBurst™ SRAM family employs high-speed, low-power CMOS designs that are fabricated using an advanced CMOS process.

Micron's 2Mb SyncBurst SRAMs integrate a 128K x 18, 64K x 32, or 64K x 36 SRAM core with advanced synchronous peripheral circuitry and a 2-bit burst counter. All synchronous inputs pass through registers

100-Pin TQFP**

**JEDEC-standard MS-026 BHA (LQFP).

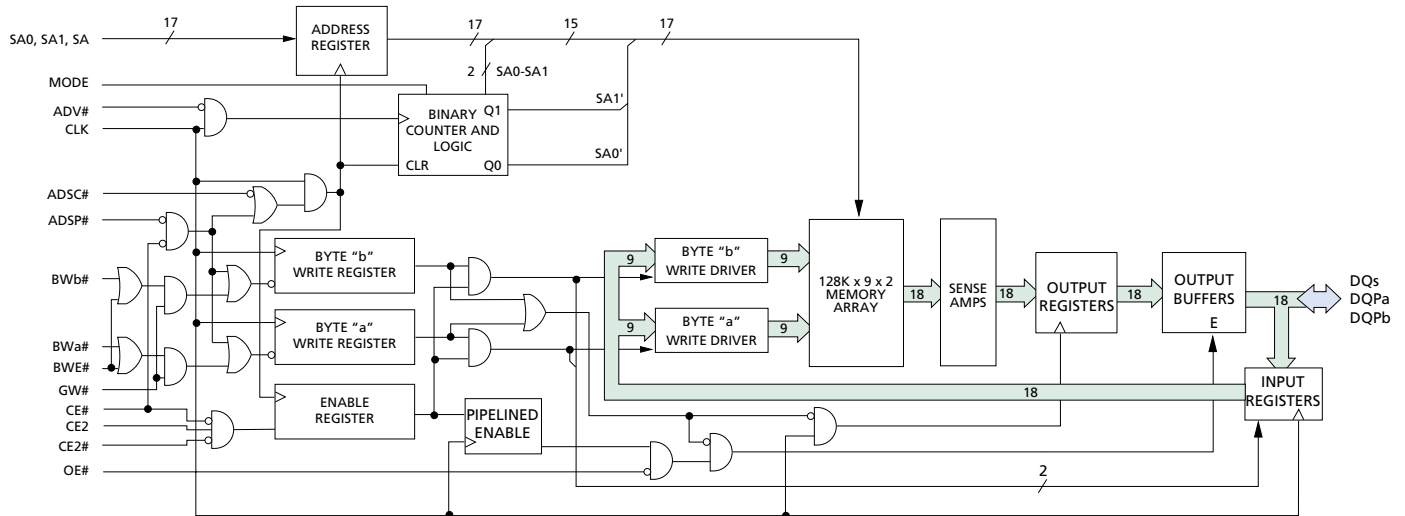

controlled by a positive-edge-triggered single clock input (CLK). The synchronous inputs include all addresses, all data inputs, active LOW chip enable (CE#), two additional chip enables for easy depth expansion (CE2, CE2#), burst control inputs (ADSC#, ADSP#, ADV#), byte write enables (BWx#) and global write (GW#).

Asynchronous inputs include the output enable (OE#), clock (CLK) and snooze enable (ZZ). There is also a burst mode pin (MODE) that selects between interleaved and linear burst modes. The data-out (Q), enabled by OE#, is also asynchronous. WRITE cycles can be from one to two bytes wide (x18) or from one to four bytes wide (x32/x36), as controlled by the write control inputs.

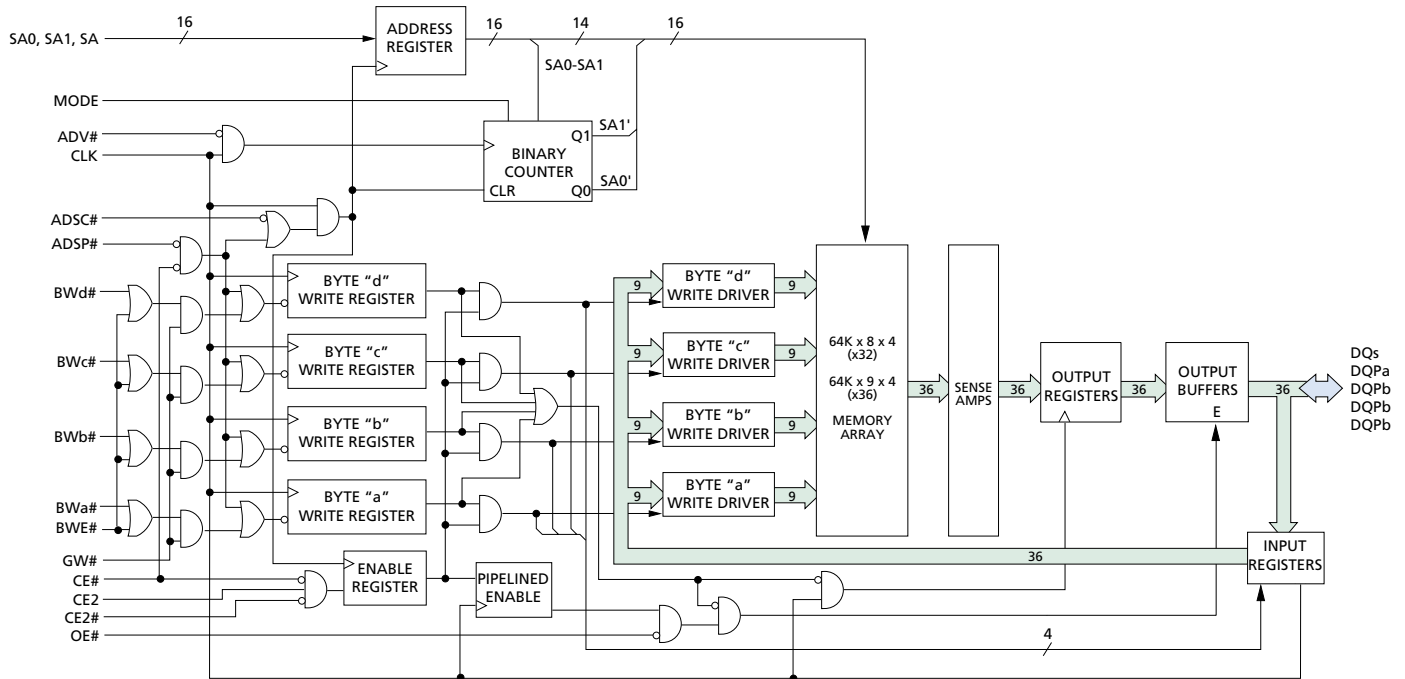

Burst operation can be initiated with either address status processor (ADSP#) or address status controller (ADSC#) input pins. Subsequent burst addresses can be internally generated as controlled by the burst advance pin (ADV#).

Address and write control are registered on-chip to simplify WRITE cycles. This allows self-timed WRITE cycles. Individual byte enables allow individual bytes to be written. During WRITE cycles on the x18 device, BWa# controls DQa pins and DQP_a; BWb# controls DQb pins and DQP_b. During WRITE cycles on the x32 and x36 devices, BWa# controls DQa pins and DQP_a; BWb# controls DQb pins and DQP_b; BWc# controls

2Mb: 128K x 18, 64K x 32/36 PIPELINED, DCD SYNCBURST SRAM

GENERAL DESCRIPTION (continued)

DQc pins and DQp; BWd# controls DQd pins and DQpd. GW# LOW causes all bytes to be written. Parity pins are only available on the x18 and x36 versions.

The device incorporates an additional pipelined enable register which delays turning off the output buffer an additional cycle when a deselect is executed. This feature allows depth expansion without penalizing system performance.

Micron's 2Mb SyncBurst SRAMs operate from a +3.3V V_{DD} power supply, and all inputs and outputs are TTL-compatible. The device is ideally suited for Pentium® and PowerPC pipelined systems and systems that benefit from a very wide, high-speed data bus. The device is also ideal in generic 16-, 18-, 32-, 36-, 64-, and 72-bit-wide applications.

93 94 – –	93 94 95 96	BWa# BWb# BWc# BWD#	Input	Synchronous Byte Write Enables: These active LOW inputs allow individual bytes to be written and must meet the setup and hold times around the rising edge of CLK. A byte write enable is LOW for a WRITE cycle and HIGH for a READ cycle. For the x18 version, BWa# controls DQa pins and DQP _a ; BWb# controls DQb pins and DQP _b . For the x32 and x36 versions, BWa# controls DQa pins and DQP _a ; BWb# controls DQb pins and DQP _b ; BWc# controls DQc pins and DQP _c ; BWD# controls DQd pins and DQP _d . Parity is only available on the x18 and x36 versions.
87	87	BWE#	Input	Byte Write Enable: This active LOW input permits BYTE WRITE operations and must meet the setup and hold times around the rising edge of CLK.
88	88	GW#	Input	Global Write: This active LOW input allows a full 18-, 32-, or 36-bit WRITE to occur independent of the BWE# and BWx# lines and must meet the setup and hold times around the rising edge of CLK.
89	89	CLK	Input	Clock: This signal registers the address, data, chip enable, byte write enables and burst control inputs on its rising edge. All synchronous inputs must meet setup and hold times around the clock's rising edge.
98	98	CE#	Input	Synchronous Chip Enable: This active LOW input is used to enable the device and conditions the internal use of ADSP#. CE# is sampled only when a new external address is loaded.
92	92	CE2#	Input	Synchronous Chip Enable: This active LOW input is used to enable the device and is sampled only when a new external address is loaded.
64	64	ZZ	Input	Snooze Enable: This active HIGH, asynchronous input causes the device to enter a low-power standby mode in which all data in the memory array is retained. When ZZ is active, all other inputs are ignored.
97	97	CE2	Input	Synchronous Chip Enable: This active HIGH input is used to enable the device and is sampled only when a new external address is loaded.
86	86	OE#	Input	Output Enable: This active LOW, asynchronous input enables the data I/O output drivers.
83	83	ADV#	Input	Synchronous Address Advance: This active LOW input is used to advance the internal burst counter, controlling burst access after the external address is loaded. A HIGH on this pin effectively causes wait states to be generated (no address advance). To ensure use of correct address during a WRITE cycle, ADV# must be HIGH at the rising edge of the first clock after an ADSP# cycle is initiated.

TQFP PIN DESCRIPTIONS (continued)

x18	x32/x36	SYMBOL	TYPE	DESCRIPTION
84	84	ADSP#	Input	Synchronous Address Status Processor: This active LOW input interrupts any ongoing burst, causing a new external address to be registered. A READ is performed using the new address, independent of the byte write enables and ADSC#, but dependent upon CE#, CE2, and CE2#. ADSP# is ignored if CE# is HIGH. Power-down state is entered if CE2 is LOW or CE2# is HIGH.
85	85	ADSC#	Input	Synchronous Address Status Controller: This active LOW input interrupts any ongoing burst, causing a new external address to be registered. A READ or WRITE is performed using the new address if CE# is LOW. ADSC# is also used to place the chip into power-down state when CE# is HIGH.
31	31	MODE	Input	Mode: This input selects the burst sequence. A LOW on this pin selects "linear burst." NC or HIGH on this pin selects "interleaved burst." Do not alter input state while device is operating.

- NOTE:**
1. X means "Don't Care." # means active LOW. H means logic HIGH. L means logic LOW.
 2. For WRITE#, L means any one or more byte write enable signals (BWa#, BWb#, BWc# or Bwd#) and BWE# are LOW or GW# is LOW. WRITE# = H for all BWx#, BWE#, GW# HIGH.
 3. BWa# enables WRITES to DQa pins, DQPa. BWb# enables WRITES to DQb pins, DQPb. BWc# enables WRITES to DQc pins, DQPC. Bwd# enables WRITES to DQd pins, DQPD. DQPa and DQPb are only available on the x18 and x36 versions. DQPC and DQPD are only available on the x36 version.
 4. All inputs except OE# and ZZ must meet setup and hold times around the rising edge (LOW to HIGH) of CLK.
 5. Wait states are inserted by suspending burst.
 6. For a WRITE operation following a READ operation, OE# must be HIGH before the input data setup time and held HIGH throughout the input data hold time.
 7. This device contains circuitry that will ensure the outputs will be in High-Z during power-up.
 8. ADSP# LOW always initiates an internal READ at the L-H edge of CLK. A WRITE is performed by setting one or more byte write enable signals and BWE# LOW or GW# LOW for the subsequent L-H edge of CLK. Refer to WRITE timing diagram for clarification.

ABSOLUTE MAXIMUM RATINGS*

*Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**Maximum junction temperature depends upon package type, cycle time, loading, ambient temperature and airflow. See Micron Technical Note TN-05-14 for more information.

- NOTE:**
1. Test conditions as specified with the output loading shown in Figure 1 ($V_{DDQ} = +3.3\text{V} +0.3\text{V}/-0.165\text{V}$) unless otherwise noted.
 2. Measured as HIGH above V_{IH} and LOW below V_{IL} .
 3. This parameter is measured with the output loading shown in Figure 2.
 4. This parameter is sampled.
 5. Transition is measured $\pm 500\text{mV}$ from steady state voltage.
 6. Refer to Technical Note TN-58-09, "Synchronous SRAM Bus Contention Design Considerations," for a more thorough discussion on these parameters.
 7. OE# is a "Don't Care" when a byte write enable is sampled LOW.
 8. A WRITE cycle is defined by at least one byte write enable LOW and ADSP# HIGH for the required setup and hold times. A READ cycle is defined by all byte write enables HIGH and ADSC# or ADV# LOW or ADSP# LOW for the required setup and hold times.
 9. This is a synchronous device. All addresses must meet the specified setup and hold times for all rising edges of CLK when either ADSP# or ADSC# is LOW and chip enabled. All other synchronous inputs must meet the setup and hold times with stable logic levels for all rising edges of clock (CLK) when the chip is enabled. Chip enable must be valid at each rising edge of CLK when either ADSP# or ADSC# is LOW to remain enabled.

AC TEST CONDITIONS

Input pulse levels	$V_{IH} = (V_{DD}/2.2) + 1.5V$
.....	$V_{IL} = (V_{DD}/2.2) - 1.5V$
Input rise and fall times	1ns
Input timing reference levels	$V_{DD}/2.2$
Output reference levels	$V_{DD}Q/2.2$
Output load	See Figures 1 and 2

LOAD DERATING CURVES

The Micron 128K x 18, 64K x 32, and 64K x 36 SyncBurst SRAM timing is dependent upon the capacitive loading on the outputs.

Consult the factory for copies of I/O current versus voltage curves.

SNOOZE MODE

SNOOZE MODE is a low-current, “power-down” mode in which the device is deselected and current is reduced to I_{SB2Z} . The duration of SNOOZE MODE is dictated by the length of time the ZZ pin is in a HIGH state. After the device enters SNOOZE MODE, all inputs except ZZ become gated inputs and are ignored.

The ZZ pin is an asynchronous, active HIGH input that causes the device to enter SNOOZE MODE. When the ZZ pin becomes a logic HIGH, I_{SB2Z} is guaranteed after the setup time t_{ZZ} is met. Any READ or WRITE operation pending when the device enters SNOOZE MODE is not guaranteed to complete successfully. Therefore, SNOOZE MODE must not be initiated until valid pending operations are completed.

SNOOZE MODE ELECTRICAL CHARACTERISTICS

DESCRIPTION	CONDITIONS	SYMBOL	MIN	MAX	UNITS	NOTES
Current during SNOOZE MODE	$ZZ \geq V_{IH}$	I_{SB2Z}		10	mA	
ZZ active to input ignored		t_{ZZ}		$2(t_{KC})$	ns	1
ZZ inactive to input sampled		t_{RZZ}	$2(t_{KC})$		ns	1
ZZ active to snooze current		t_{ZZI}		$2(t_{KC})$	ns	1
ZZ inactive to exit snooze current		t_{RZZI}	0		ns	1

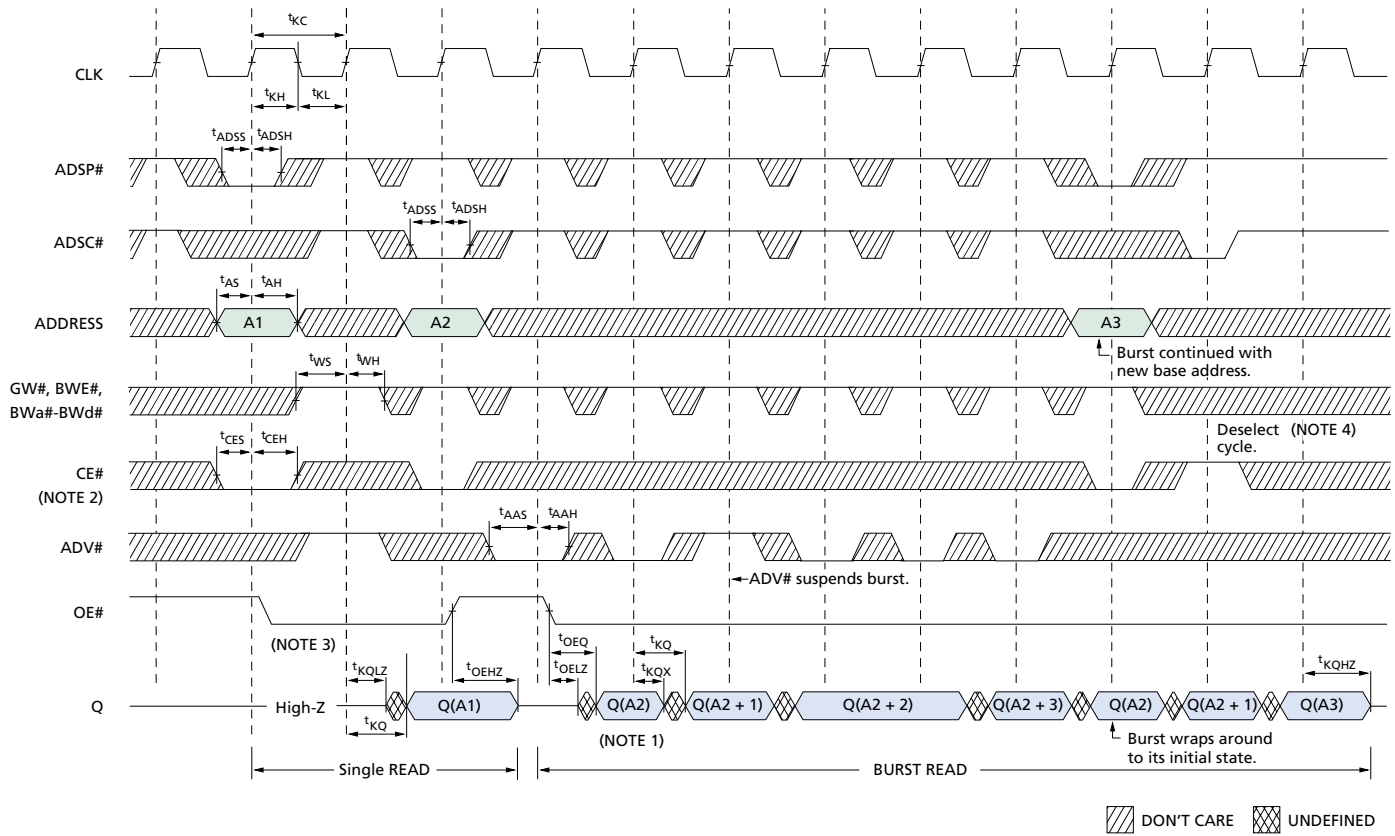

NOTE: 1. This parameter is sampled.

- NOTE:**
1. Q(A2) refers to output from address A2. Q(A2 + 1) refers to output from the next internal burst address following A2.
 2. CE2# and CE2 have timing identical to CE#. On this diagram, when CE# is LOW, CE2# is LOW and CE2 is HIGH. When CE# is HIGH, CE2# is HIGH and CE2 is LOW.
 3. Timing is shown assuming that the device was not enabled before entering into this sequence. OE# does not cause Q to be driven until after the following clock rising edge.
 4. Outputs are disabled within two clock cycles after deselect.

 2. CE2# and CE2 have timing identical to CE#. On this diagram, when CE# is LOW, CE2# is LOW and CE2 is HIGH. When CE# is HIGH, CE2# is HIGH and CE2 is LOW.
 3. OE# must be HIGH before the input data setup and held HIGH throughout the data hold time. This prevents input/output data contention for the time period prior to the byte write enable inputs being sampled.
 4. ADV# must be HIGH to permit a WRITE to the loaded address.
 5. Full-width WRITE can be initiated by GW# LOW; or GW# HIGH and BWE#, BWA# and BWD# LOW for x18 device; or GW# HIGH and BWE#, BWA#-BWD# LOW for x32 and x36 devices.
