

3.3V LOW SKEW PLL-BASED CMOS CLOCK DRIVER (WITH 3-STATE)

IDT74FCT388915T
70/100/133/150
NRND

NOT RECOMMENDED FOR NEW DESIGNS

FEATURES:

- 0.5 MICRON CMOS Technology
- Input frequency range: 10MHz – f2Q Max. spec (FREQ_SEL = HIGH)
- Max. output frequency: 150MHz
- Pin and function compatible with FCT88915T, MC88915T
- 5 non-inverting outputs, one inverting output, one 2x output, one ÷2 output; all outputs are TTL-compatible
- 3-State outputs
- Duty cycle distortion < 500ps (max.)
- 32I–16mA drive at CMOS output voltage levels
- Vcc = 3.3V ± 0.3V
- Inputs can be driven by 3.3V or 5V components
- Available in 28 pin PLCC and SSOP packages
- **NOT RECOMMENDED FOR NEW DESIGNS**

DESCRIPTION:

The FCT388915T uses phase-lock loop technology to lock the frequency and phase of outputs to the input reference clock. It provides low skew clock distribution for high performance PCs and workstations. One of the outputs is fed back to the PLL at the FEEDBACK input resulting in essentially zero delay across the device. The PLL consists of the phase/frequency detector, charge pump, loop filter and VCO. The VCO is designed for a 2Q operating frequency range of 40MHz to f2Q Max.

The FCT388915T provides 8 outputs, the $\overline{Q5}$ output is inverted from the Q outputs. The 2Q runs at twice the Q frequency and Q/2 runs at half the Q frequency.

The FREQ_SEL control provides an additional ÷2 option in the output path. PLL_EN allows bypassing of the PLL, which is useful in static test modes. When PLL_EN is low, SYNC input may be used as a test clock. In this test mode, the input frequency is not limited to the specified range and the polarity of outputs is complementary to that in normal operation (PLL_EN = 1). The LOCK output attains logic HIGH when the PLL is in steady-state phase and frequency lock. When OE/RST is low, all the outputs are put in high impedance state and registers at Q, $\overline{Q}$ and Q/2 outputs are reset.

The FCT388915T requires one external loop filter component as recommended in Figure 3.

PIN CONFIGURATION

PIN DESCRIPTION

Pin Name	I/O	Description
SYNC(0)	I	Reference clock input
SYNC(1)	I	Reference clock input
REF_SEL	I	Chooses reference between SYNC (0) & SYNC (1) (refer to functional block diagram)
FREQ_SEL	I	Selects between ÷ 1 and ÷ 2 frequency options (refer to functional block diagram)
FEEDBACK	I	Feedback input to phase detector
LF	I	Input for external loop filter connection
Q0-Q4	O	Clock output
$\overline{Q5}$	O	Inverted clock output
2Q	O	Clock output (2 x Q frequency)
Q/2	O	Clock output (Q frequency ÷ 2)
LOCK	O	Indicates phase lock has been achieved (HIGH when locked)
OE/RST	I	Asynchronous reset (active LOW) and output enable (active HIGH). When HIGH, outputs are enabled. When LOW, outputs are in HIGH impedance.
PLL_EN	I	Disables phase-lock for low frequency testing (refer to functional block diagram)

GENERAL AC SPECIFICATION NOTES:

- See test circuit and waveforms.
- Minimum limits are guaranteed but not tested.
- These specifications are guaranteed but not production tested.
- Under equally loaded conditions, as specified under test conditions and at a fixed temperature and voltage.
- t_{CYCLE} = 1/frequency at which each output (Q, $\bar{Q}$, Q/2 or 2Q) is expected to run.
- With V_{CC} fully powered-on and an output properly connected to the FEEDBACK pin, t_{LOCK} Max. is with C₁ = 0.1μF, t_{LOCK} Min. is with C₁ = 0.01μF. (Where C₁ is loop filter capacitor shown in Figure 2).
- The wiring diagrams and written explanations of Figure 3 demonstrate the input and output frequency relationships for various possible feedback configurations. The allowable SYNC input range to stay in the phase-locked condition is also indicated. There are two allowable SYNC frequency ranges, depending on whether FREQ_SEL is HIGH or LOW. Also it is possible to feed back the $\bar{Q}5$ output, thus creating a 180° phase shift between the SYNC input and the Q outputs. The table below summarizes the allowable SYNC frequency range for each possible configuration.

FREQ_SEL Level	Feedback Output	Allowable SYNC Input Frequency Range (MHZ)	Corresponding 2Q Output Frequency Range	Phase Relationship of the Q Outputs to Rising SYNC Edge
HIGH	Q/2	10 to (2X_Q f _{MAX} Spec)/4	40 to (2Q f _{MAX} Spec)	0°
HIGH	Any Q (Q0-Q4)	20 to (2X_Q f _{MAX} Spec)/2	40 to (2Q f _{MAX} Spec)	0°
HIGH	$\bar{Q}5$	20 to (2X_Q f _{MAX} Spec)/2	40 to (2Q f _{MAX} Spec)	180°
HIGH	2X_Q	40 to (2X_Q f _{MAX} Spec)	40 to (2Q f _{MAX} Spec)	0°
LOW	Q/2	5 to (2X_Q f _{MAX} Spec)/8	20 to (2Q f _{MAX} Spec)/2	0°
LOW	Any Q (Q0-Q4)	10 to (2X_Q f _{MAX} Spec)/4	20 to (2Q f _{MAX} Spec)/2	0°
LOW	$\bar{Q}5$	10 to (2X_Q f _{MAX} Spec)/4	20 to (2Q f _{MAX} Spec)/2	180°
LOW	2X_Q	20 to (2X_Q f _{MAX} Spec)/2	20 to (2Q f _{MAX} Spec)/2	0°

GENERAL AC SPECIFICATION NOTES (continued):

8. The tPD spec describes how the phase offset between the SYNC input and the output connected to the FEEDBACK input, varies with process, temperature and voltage. The phase measurements were made at 1.5V. The Q/2 output was terminated at the FEEDBACK input with 100Ω to V_{CC} and 100Ω to ground. tPD measurements were made with the loop filter connection shown in Figure 1 below:

Figure 1

NOTES:

1. Figure 2 shows a loop filter and analog isolation scheme which will be effective in most applications. The following guidelines should be followed to ensure stable and jitter-free operation:
 - a. All loop filter and analog isolation components should be tied as close to the package as possible. Stray current passing through the parasitics of long traces can cause undesirable voltage transients at the LF pin.
 - b. The 10μF low frequency bypass capacitor and the 0.1μF high frequency bypass capacitor form a wide bandwidth filter that will minimize the 388915T's sensitivity to voltage transients from the system digital V_{CC} supply and ground planes. If good bypass techniques are used on a board design near components which may cause digital V_{CC} and ground noise, V_{CC} step deviations should not occur at the 388915T's digital V_{CC} supply. The purpose of the bypass filtering scheme shown in figure 2 is to give the 388915T additional protection from the power supply and ground plane transients that can occur in a high frequency, high speed digital system.
 - c. The loop filter capacitor (0.1μF) can be a ceramic chip capacitor, the same as a standard bypass capacitor.
2. In addition to the bypass capacitors used in the analog filter of Figure 2 there should be a 0.1μF bypass capacitor between each of the other (digital) four V_{CC} pins and the board ground plane. This will reduce output switching noise caused by the 388915T outputs, in addition to reducing potential for noise in the "analog" section of the chip. These bypass capacitors should also be tied as close to the 388915T package as possible.

Figure 2. Recommended Loop Filter and Analog Isolation Scheme for the FCT388915T

The frequency relationship shown here is applicable to all Q outputs (Q0, Q1, Q2, Q3 and Q4).

1:2 INPUT TO "Q" OUTPUT FREQUENCY RELATIONSHIP

In this application, the Q/2 output is connected to the FEEDBACK input. The internal PLL will line up the positive edges of Q/2 and SYNC, thus the Q/2 frequency will equal the SYNC frequency. The Q outputs (Q0-Q4, Q5) will always run at 2X the Q/2 frequency, and the 2Q output will run at 4X the Q/2 frequency.

Allowable Input Frequency Range:
10MHz to (f2Q MAX Spec)/4 (for FREQ_SEL HIGH)
5MHz to (f2Q MAX Spec)/8 (for FREQ_SEL LOW)

Figure 3a. Wiring Diagram and Frequency Relationships With Q/2 Output Feedback

1:1 INPUT TO "Q" OUTPUT FREQUENCY RELATIONSHIP

In this application, the Q4 output is connected to the FEEDBACK input. The internal PLL will line up the positive edges of Q4 and SYNC, thus the Q4 frequency (and the rest of the "Q" outputs) will equal the SYNC frequency. The Q/2 output will always run at 1/2 the Q frequency, and the 2Q output will run at 2X the Q frequency.

Allowable Input Frequency Range:
20MHz to (f2Q MAX Spec)/2 (for FREQ_SEL HIGH)
10MHz to (f2Q MAX Spec)/4 (for FREQ_SEL LOW)

Figure 3b. Wiring Diagram and Frequency Relationships With Q4 Output Feedback

2:1 INPUT TO "Q" OUTPUT FREQUENCY RELATIONSHIP

In this application, the 2Q output is connected to the FEEDBACK input. The internal PLL will line up the positive edges of 2Q and SYNC, thus the 2Q frequency will equal the SYNC frequency. The Q/2 output will always run at 1/4 the 2Q frequency, and the Q output will run at 1/2 the 2Q frequency.

Allowable Input Frequency Range:
40MHz to (f2Q MAX Spec) (for FREQ_SEL HIGH)
20MHz to (f2Q MAX Spec)/2 (for FREQ_SEL LOW)

Figure 3c. Wiring Diagram and Frequency Relationships With 2Q Output Feedback

Figure 4. Multiprocessing Application Using the FCT388915T for Frequency Multiplication and Low Board-to-Board Skew

FCT388915T SYSTEM LEVEL TESTING FUNCTIONALITY

When the PLL_EN pin is LOW, the PLL is bypassed and the FCT388915T is in low frequency "test mode". In test mode (with FREQ_SEL HIGH), the 2Q output is inverted from the selected SYNC input, and the Q outputs are divide-by-2 (negative edge triggered) of the SYNC input, and the Q/2 output is divide-by-4 (negative edge triggered). With FREQ_SEL LOW the 2Q output is divide-by-2 of the SYNC, the Q outputs divide-by-4, and the Q/2 output divide-by-8.

These relationships can be seen in the block diagram. A recommended test configuration would be to use SYNC0 or SYNC1 as the test clock input, and tie PLL_EN and REF_SEL together and connect them to the test select logic.

This functionality is needed since most board-level testers run at 1 MHz or below, and the FCT 388915T cannot lock onto that low of an input frequency. In the test mode described above, any test frequency test can be used.
