

MC33465

Advance Information

Micropower Undervoltage Sensing Circuits with Programmable Output Delay

The MC33465 series are micropower undervoltage sensing circuits that are specifically designed for use with battery powered microprocessor based systems, where extended battery life is required. A choice of several threshold voltages from 0.9 V to 4.5 V are available. This device features a very low quiescent bias current of 1.0 μ A typical.

The MC33465 series features a highly accurate voltage reference, a comparator with precise thresholds and built-in hysteresis to prevent erratic reset operation, a choice of output configurations between open drain or complementary, a time delayed output, which can be programmed by the system designer, and guaranteed operation below 1.0 V with extremely low standby current. This device is available in a SOT-23 5-pin surface mount package.

Applications include direct monitoring of the MPU/logic power supply used in appliance, automotive, industrial and portable equipment.

MC33465 Features:

- Extremely Low Standby Current of 1.0 μ A at $V_{in} = 3.5$ V
- Wide Input Voltage Range (0.7 V to 10 V)
- Monitors Power Supply Voltages from 1.1 V to 5.0 V
- High Accuracy Detector Threshold ($\pm 2.5\%$)
- Two Reset Output Types (Open Drain or Complementary Drive)
- Programmable Output Delay by External Capacitor (100 ms typ. with 0.15 μ F)
- Surface Mount Package (SOT-23 5-Pin)
- Convenient Tape and Reel (3000 per Reel)

ORDERING INFORMATION

Device	Threshold Voltage	Type	Operating Temperature Range	Package
MC33465N-09ATR	0.9	Open <u>Drain</u> Reset	$T_A = -30^{\circ}$ to $+80^{\circ}\text{C}$	SOT-23
MC33465N-20ATR	2.0			
MC33465N-27ATR	2.7			
MC33465N-30ATR	3.0			
MC33465N-45ATR	4.5			
MC33465N-09CTR	0.9	Compl. <u>MOS</u> Reset		
MC33465N-20CTR	2.0			
MC33465N-27CTR	2.7			
MC33465N-30CTR	3.0			
MC33465N-45CTR	4.5			

Other voltages from 0.9 to 6.0 V, in 0.1 V increments, are available. Consult factory for information.

APPLICATION CIRCUIT INFORMATION

The MC33465 series are micropower undervoltage sensing circuits which offer a programmable time delayed output with the choice of either complementary output drive or open drain output configurations. Figure 14 shows the timing relationships between the input voltage and the resulting circuit waveforms. When the input voltage (V_{IN}) exceeds the sense comparator threshold, the timing capacitor is allowed to charge through the internal delay resistor. When the output inverting driver threshold is exceeded, the Reset output switches from a logic "0" to a

logic "1". The top curve of Figure 11 provides the nominal delay time for a given value of delay capacitance. When V_{IN} drops below the comparator threshold minus hysteresis voltage, the delay capacitor discharges. When the capacitance voltage drops below the inverting driver threshold, the output switches from a logic "1" to a logic "0". The bottom curve in Figure 11 provides typical delay time for given delay capacitance values. The inverting driver threshold voltage is typically about $V_{IN}/2$, as shown in Figure 10.
