FUNCTIONAL BLOCK DIAGRAMS

GENERAL DESCRIPTION

The ADG508A and ADG509A are CMOS monolithic analog multiplexers with 8 channels and dual 4 channels respectively. The ADG508A switches one of 8 inputs to a common output depending on the state of three binary addresses and an enable input. The ADG509A switches one of 4 differential inputs to a common differential output depending on the state of two binary addresses and an enable input. Both devices have TTL and 5V CMOS logic compatible digital inputs.

The ADG508A and ADG509A are designed on an enhanced LC^2MOS process which gives an increased signal capability of V_{SS} to V_{DD} and enables operation over a wide range of supply voltages. The devices can comfortably operate anywhere in the 10.8V to 16.5V single or dual supply range. These multiplexers also feature high switching speeds and low R_{ON} .

PRODUCT HIGHLIGHTS

- Single/Dual Supply Specifications with a Wide Tolerance:**
The devices are specified in the 10.8V to 16.5V range for both single and dual supplies.
- Extended Signal Range:**
The enhanced LC^2MOS processing results in a high breakdown and an increased analog signal range of V_{SS} to V_{DD} .
- Break-Before-Make Switching:**
Switches are guaranteed break-before-make so that input signals are protected against momentary shorting.
- Low Leakage:**
Leakage currents in the range of 20pA make these multiplexers suitable for high precision circuits.

*COMMENT: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

CAUTION

ESD (electrostatic discharge) sensitive device. The digital control inputs are Zener protected; however, permanent damage may occur on unconnected devices subject to high energy electrostatic fields. Unused devices must be stored in conductive foam or shunts. The protective foam should be discharged to the destination socket before devices are removed.

SINGLE SUPPLY OCTAL DAC APPLICATION

The following circuit shows the ADG508A connected as a demultiplexer to provide eight separate digitally programmable voltages (0 to +10V) from the AD7245. The AD7245 is a complete 12-bit, voltage output DAC with output amplifier and Zener

voltage reference on a monolithic CMOS chip. The entire system operates from a single +15V power supply. The ADG508A is ideally suited for the application because it has both low charge injection and I_S (OFF) leakage current.
