For enhanced ESD performances

Features

- AEC-Q100 qualified 
- Frequency compensation implemented internally
- Large DC voltage gain: 100 dB
- Wide bandwidth (unity gain): 1.1 MHz (temperature compensated)
- Very low supply current/amplifier, essentially independent of supply voltage
- Low input bias current: 20 nA (temperature compensated)
- Low input offset current: 2 nA
- Input common-mode voltage range includes negative rail
- Differential input voltage range equal to the power supply voltage
- Large output voltage swing 0 V to $[V_{CC+} - 1.5 \text{ V}]$

Description

This circuit consists of two independent, high gain operational amplifiers (op amps) that have frequency compensation implemented internally. They are designed specifically for automotive and industrial control systems. The circuit operates from a single power supply over a wide range of voltages. The low power supply drain is independent of the magnitude of the power supply voltage.

Application areas include transducer amplifiers, DC gain blocks and all the conventional op amp circuits which can now be more easily implemented in single power supply systems. For example, these circuits can be directly supplied from the standard 5 V which is used in logic systems and easily provides the required interface electronics without requiring any additional power supply.

In the linear mode, the input common-mode voltage range includes ground and the output voltage can also swing to ground, even though operated from a single power supply.

(1) The exposed pad of the DFN8 2x2 can be connected to (VCC-) or left floating.

3 Absolute maximum ratings and operating conditions

Table 1. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage ⁽¹⁾	± 16 or 32	V
V_{id}	Differential input voltage ⁽²⁾	± 32	
V_{in}	Input voltage	-0.3 to 32	
	Output short-circuit duration ⁽³⁾	Infinite	s
I_{in}	Input current: V_{in} driven negative ⁽⁴⁾	5 mA in DC or 50 mA in AC (duty cycle = 10 %, T = 1 s)	mA
	Input current: V_{in} driven positive above AMR value ⁽⁵⁾	0.4	
T_{stg}	Storage temperature range	-65 to 150	°C
T_j	Maximum junction temperature	160	
R_{thja}	Thermal resistance junction to ambient ⁽⁶⁾		°C/W
	TSSOP8	120	
	DFN8 2x2 wettable flank	57	
R_{thjc}	Thermal resistance junction to case ⁽⁶⁾		
	TSSOP8	37	
	DFN8 2x2 wettable flank	26	
ESD	HBM: human body model ⁽⁷⁾	300	V
	MM: machine model ⁽⁸⁾	200	
	CDM: charged device model ⁽⁹⁾	1.5	kV

1. All voltage values, except differential voltage are with respect to network ground terminal.
2. Differential voltages are the non-inverting input terminal with respect to the inverting input terminal.
3. Short-circuits from the output to V_{CC} can cause excessive heating if $(V_{CC+}) > 15$ V. The maximum output current is approximately 40 mA, independent of the magnitude of V_{CC} . Destructive dissipation can result from simultaneous short-circuits on all amplifiers.
4. This input current only exists when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistor becoming forward-biased and thereby acting as input diode clamp. In addition to this diode action, there is NPN parasitic action on the IC chip. This transistor action can cause the output voltages of the op amps to go to the V_{CC} voltage level (or to ground for a large overdrive) for the time during which an input is driven negative. This is not destructive and normal output is restored for input voltages above -0.3 V.
5. The junction base/substrate of the input PNP transistor polarized in reverse must be protected by a resistor in series with the inputs to limit the input current to 400 μ A max ($R = (V_{in}-32 \text{ V})/400 \mu\text{A}$).
6. Short-circuits can cause excessive heating and destructive dissipation. Values are typical.
7. Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 k Ω resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
8. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of connected pin combinations while the other pins are floating.
9. Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to the ground through only one pin. This is done for all pins.

Table 2. Operating conditions

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage	3 to 30	V
V_{icm}	Common-mode input voltage range	0 to $(V_{CC} +) - 1.5$	
T_{oper}	Operating free-air temperature range	-40 to 150	°C

4 Electrical characteristics

Table 3. $V_{CC+} = 5\text{ V}$, $V_{CC-} = \text{ground}$, $V_O = 1.4\text{ V}$, $T_{\text{amb}} = 25\text{ }^{\circ}\text{C}$ (unless otherwise specified), $T_{\text{min}} = -40\text{ }^{\circ}\text{C}$, and $T_{\text{max}} = 150\text{ }^{\circ}\text{C}$

Symbol	Parameter	Min.	Typ.	Max.	Unit
V_{io}	Input offset voltage, $T_{\text{amb}} = 25\text{ }^{\circ}\text{C}$, LM2904AH ⁽¹⁾		1	2	mV

	High level output voltage ($V_{CC} + = 30\text{ V}$), $T_{\text{min}} \leq T_{\text{amb}} \leq T_{\text{max}}$	26	27		
	High level output voltage ($V_{CC} + = 30\text{ V}$), $T_{\text{amb}} = 25\text{ }^{\circ}\text{C}$, $R_L = 10\text{ k}\Omega$	27			
	High level output voltage ($V_{CC} + = 30\text{ V}$), $T_{\text{min}} \leq T_{\text{amb}} \leq T_{\text{max}}$	27	28		
V_{OL}	Low level output voltage ($R_L = 10\text{ k}\Omega$), $T_{\text{amb}} = 25\text{ }^{\circ}\text{C}$		5	20	mV
	Low level output voltage ($R_L = 10\text{ k}\Omega$), $T_{\text{min}} \leq T_{\text{amb}} \leq T_{\text{max}}$			20	
SR	Slew rate, $V_{CC} + = 15\text{ V}$, $V_{in} = 0.5$ to 3 V , $R_L = 2\text{ k}\Omega$, $C_L = 100\text{ pF}$, unity gain, $T_{\text{amb}} = 25\text{ }^{\circ}\text{C}$	0.3	0.6		$\text{V}/\mu\text{s}$
	Slew rate, $V_{CC} + = 15\text{ V}$, $V_{in} = 0.5$ to 3 V , $R_L = 2\text{ k}\Omega$, $C_L = 100\text{ pF}$, unity gain, $T_{\text{min}} \leq T_{\text{amb}} \leq T_{\text{max}}$	0.2			
GBP	Gain bandwidth product, $f = 100\text{ kHz}$, $V_{CC} + = 30\text{ V}$, $V_{in} = 10\text{ mV}$, $R_L = 2\text{ k}\Omega$, $C_L = 100\text{ pF}$	0.7	1.1		MHz
THD	Total harmonic distortion, $f = 1\text{ kHz}$, $A_V = 20\text{ dB}$, $R_L = 2\text{ k}\Omega$, $V_O = 2\text{ V}_{pp}$, $C_L = 100\text{ pF}$, $V_{CC} + = 30\text{ V}$		0.02		%
e_n	Equivalent input noise voltage, $f = 1\text{ kHz}$, $R_S = 100\text{ }\Omega$, $V_{CC} + = 30\text{ V}$		55		$\text{nV}/\sqrt{\text{Hz}}$

Symbol	Parameter	Min.	Typ.	Max.	Unit
V_{O1}/V_{O2}	Channel separation, $1\text{ kHz} \leq f \leq 20\text{ kHz}$ ⁽⁴⁾		120		dB

- $V_O = 1.4\text{ V}$, $R_S = 0\ \Omega$, $5\text{ V} < V_{CC+} < 30\text{ V}$, $0\text{ V} < V_{ic} < (V_{CC+}) - 1.5\text{ V}$.
- The direction of the input current is out of the IC. This current is essentially constant, independent of the state of the output, so there is no change in the loading charge on the input lines.
- The input common-mode voltage of either input signal voltage should not be allowed to go negative by more than 0.3 V . The upper end of the common-mode voltage range is $(V_{CC+}) - 1.5\text{ V}$, but either or both inputs can go to 32 V without damage.
- Due to the proximity of external components, ensure that the stray capacitance does not cause coupling between these external parts. This can typically be detected at higher frequencies because this type of capacitance increases.
