description

The '279 offers 4 basic $\overline{S}$-$\overline{R}$ flip-flop latches in one 16-pin, 300-mil package. Under conventional operation, the $\overline{S}$-$\overline{R}$ inputs are normally held high. When the $\overline{S}$ input is pulsed low, the Q output will be set high. When $\overline{R}$ is pulsed low, the Q output will be reset low. Normally, the $\overline{S}$-$\overline{R}$ inputs should not be taken low simultaneously. The Q output will be unpredictable in this condition.

FUNCTION TABLE
(each latch)

INPUTS $\overline{S}$†	INPUTS $\overline{R}$	OUTPUT Q
H	H	Q_0
L	H	H
H	L	L
L	L	H‡

H = high level L = low level

†For latches with double S inputs:

Q_0 = the level of Q before the indicated input conditions were established.

‡ This configuration is nonstable: that is, it may not persist when the $\overline{S}$ and $\overline{R}$ inputs return to their inactive (high) level.

H = both $\overline{S}$ inputs high

L = one or both $\overline{S}$ inputs low
