

- 100-Mbps to 660-Mbps Serial LVDS Data Payload Bandwidth at 10-MHz to 66-MHz System Clock
- Pin-Compatible Superset of NSM DS92LV1023/DS92LV1224
- Chipset (Serializer/Deserializer) Power Consumption <450 mW (Typ) at 66 MHz
- Synchronization Mode for Faster Lock
- Lock Indicator
- No External Components Required for PLL
- Low-Cost 28-Pin SSOP Package
- Industrial Temperature Qualified,  $T_A = -40^\circ\text{C}$  to  $85^\circ\text{C}$
- Programmable Edge Trigger on Clock
- Flow-Through Pinout for Easy PCB Layout

SN65LV1023A  
Serializer

SN65LV1224A  
Deserializer

## description

The SN65LV1023A serializer and SN65LV1224A deserializer comprise a 10-bit serdes chipset designed to transmit and receive serial data over LVDS differential backplanes at equivalent parallel word rates from 10 MHz to 66 MHz. Including overhead, this translates into a serial data rate between 120-Mbps and 792-Mbps payload encoded throughput.

Upon power up, the chipset link can be initialized via a synchronization mode with internally generated SYNC patterns, or the deserializer can be allowed to synchronize to random data. By using the synchronization mode, the deserializer establishes lock within specified, shorter time parameters.

The device can be entered into a power-down state when no data transfer is required. Alternatively, a mode is available to place the output pins in the high-impedance state without losing PLL lock.

The SN65LV1023A and SN65LV1224A are characterized for operation over ambient air temperature of  $-40^\circ\text{C}$  to  $85^\circ\text{C}$ .

Deserializer	SN65LV1224ADB

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

# SN65LV1023A/SN65LV1224A 10-MHz TO 66-MHz, 10:1 LVDS SERIALIZER/DESERIALIZER

SLLS570D – JUNE 2003 – REVISED JANUARY 2005

## block diagrams

## functional description

The SN65LV1023A and SN65LV1224A are a 10-bit serializer/deserializer chipset designed to transmit data over differential backplanes or unshielded twisted pair (UTP) at clock speeds from 10 MHz to 66 MHz. The chipset has five states of operation: initialization mode, synchronization mode, data transmission mode, power-down mode, and high-impedance mode. The following sections describe each state of operation.

### initialization mode

Initialization of both devices must occur before data transmission can commence. Initialization refers to synchronization of the serializer and deserializer PLLs to local clocks.

When  $V_{CC}$  is applied to the serializer and/or deserializer, the respective outputs enter the high-impedance state, while on-chip power-on circuitry disables internal circuitry. When  $V_{CC}$  reaches 2.45 V, the PLL in each device begins locking to a local clock. For the serializer, the local clock is the transmit clock (TCLK) provided by an external source. For the deserializer, a local clock must be applied to the REFCLK pin. The serializer outputs remain in the high-impedance state, while the PLL locks to the TCLK.

## functional description (continued)

### synchronization mode

The deserializer PLL must synchronize to the serializer in order to receive valid data. Synchronization can be accomplished in one of two ways:

- **Rapid Synchronization:** The serializer has the capability to send specific SYNC patterns consisting of six ones and six zeros switching at the input clock rate. The transmission of SYNC patterns enables the deserializer to lock to the serializer signal within a deterministic time frame. This transmission of SYNC patterns is selected via the SYNC1 and SYNC2 inputs on the serializer. Upon receiving valid SYNC1 or SYNC2 pulse (wider than 6 clock cycles), 1026 cycles of SYNC pattern are sent.

When the deserializer detects edge transitions at the LVDS input, it attempts to lock to the embedded clock information. The deserializer LOCK output remains high while its PLL locks to the incoming data or SYNC patterns present on the serial input. When the deserializer locks to the LVDS data, the LOCK output goes low. When LOCK is low, the deserializer outputs represent incoming LVDS data. One approach is to tie the deserializer LOCK output directly to SYNC1 or SYNC2.

- **Random-Lock Synchronization:** The deserializer can attain lock to a data stream without requiring the serializer to send special SYNC patterns. This allows the SN65LV1224A to operate in open-loop applications. Equally important is the deserializer's ability to support hot insertion into a running backplane. In the open-loop or hot-insertion case, it is assumed the data stream is essentially random. Therefore, because lock time varies due to data stream characteristics, the exact lock time cannot be predicted. The primary constraint on the random lock time is the initial phase relation between the incoming data and the REFCLK when the deserializer powers up.

The data contained in the data stream can also affect lock time. If a specific pattern is repetitive, the deserializer could enter false lock—falsely recognizing the data pattern as the start/stop bits. This is referred to as repetitive multitransition (RMT); see Figure 1 for RMT examples. This occurs when more than one low-high transition takes place per clock cycle over multiple cycles. In the worst case, the deserializer could become locked to the data pattern rather than the clock. Circuitry within the deserializer can detect that the possibility of false lock exists. Upon detection, the circuitry prevents the LOCK output from becoming active until the potential false lock pattern changes. Notice that the RMT pattern only affects the deserializer lock time, and once the deserializer is in lock, the RMT pattern does not affect the deserializer state as long as the same data boundary happens each cycle. The deserializer does not go into lock until it finds a unique four consecutive cycles of data boundary (stop/start bits) at the same position.

The deserializer stays in lock until it cannot detect the same data boundary (stop/start bits) for four consecutive cycles. Then the deserializer goes out of lock and hunts for the new data boundary (stop/start bits). In the event of loss of synchronization, the LOCK pin output goes high and the outputs (including RCLK) enter a high-impedance state. The user's system should monitor the LOCK pin in order to detect a loss of synchronization. Upon detection of loss of lock, sending sync patterns for resynchronization is desirable if reestablishing lock within a specific time is critical. However, the deserializer can lock to random data as previously noted.

# SN65LV1023A/SN65LV1224A 10-MHz TO 66-MHz, 10:1 LVDS SERIALIZER/DESERIALIZER

SLLS570D – JUNE 2003 – REVISED JANUARY 2005

## synchronization mode (continued)

$D_{IN0}$  Held Low and  $D_{IN1}$  Held High

$D_{IN4}$  Held Low and  $D_{IN5}$  Held High

$D_{IN8}$  Held Low and  $D_{IN9}$  Held High

Figure 1. RMT Pattern Examples

## data transmission mode

After initialization and synchronization, the serializer accepts parallel data from inputs  $D_{IN0}$ – $D_{IN9}$ . The serializer uses the TCLK input to latch the incoming data. The TCLK\_R/F pin selects which edge the serializer uses to strobe incoming data. If either of the SYNC inputs is high for six TCLK cycles, the data at  $D_{IN0}$ – $D_{IN9}$  is ignored regardless of the clock edge selected and 1026 cycles of SYNC pattern are sent.

After determining which clock edge to use, a start and stop bit, appended internally, frames the data bits in the register. The start bit is always high and the stop bit is always low. The start and stop bits function as the embedded clock bits in the serial stream.

The serializer transmits serialized data and appended clock bits (10+2 bits) from the serial data output (DO±) at 12 times the TCLK frequency. For example, if TCLK is 66 MHz, the serial rate is  $66 \times 12 = 792$  Mbps. Because only 10 bits are input data, the useful data rate is 10 times the TCLK frequency. For instance, if TCLK = 66 MHz, the useful data rate is  $66 \times 10 = 660$  Mbps. The data source, which provides TCLK, must be in the range of 10 MHz to 66 MHz.

## functional description (continued)

The serializer outputs ( $DO_{\pm}$ ) can drive point-to-point connections or limited multipoint or multidrop backplanes. The outputs transmit data when the enable pin (DEN) is high,  $PWRDN$  = high, and  $SYNC1$  and  $SYNC2$  are low. When DEN is driven low, the serializer output pins enter the high-impedance state.

Once the deserializer has synchronized to the serializer, the  $\overline{LOCK}$  pin transitions low. The deserializer locks to the embedded clock and uses it to recover the serialized data.  $ROUT$  data is valid when  $\overline{LOCK}$  is low, otherwise  $ROUT_0$ – $ROUT_9$  is invalid. The  $ROUT_0$ – $ROUT_9$  data is strobed out by  $RCLK$ . The specific  $RCLK$  edge polarity to be used is selected by the  $RCLK\_R/F$  input. The  $ROUT_0$ – $ROUT_9$ ,  $\overline{LOCK}$  and  $RCLK$  outputs can drive a maximum of three CMOS input gates (15-pF load, total for all three) with a 66-MHz clock.

### power down

When no data transfer is required, the power-down mode can be used. The serializer and deserializer use the power-down state, a low-power sleep mode, to reduce power consumption. The deserializer enters power down when you drive  $PWRDN$  and  $REN$  low. The serializer enters power down when you drive  $\overline{PWRDN}$  low. In power down, the PLL stops and the outputs enter a high-impedance state, which disables load current and reduces supply current to the milliampere range. To exit power down, you must drive the  $PWRDN$  pin high.

Before valid data exchanges between the serializer and deserializer can resume, you must reinitialize and resynchronize the devices to each other. Initialization of the serializer takes 1026  $TCLK$  cycles. The deserializer initialize and drives  $\overline{LOCK}$  high until lock to the LVDS clock occurs.

### high-impedance mode

The serializer enters the high-impedance mode when the DEN pin is driven low. This puts both driver output pins ( $DO_{+}$  and  $DO_{-}$ ) into a high-impedance state. When you drive DEN high, the serializer returns to the previous state, as long as all other control pins remain static ( $SYNC1$ ,  $SYNC2$ ,  $PWRDN$ ,  $TCLK\_R/F$ ). When the  $REN$  pin is driven low, the deserializer enters high-impedance mode. Consequently, the receiver output pins ( $ROUT_0$ – $ROUT_9$ ) and  $RCLK$  are placed into the high-impedance state. The  $\overline{LOCK}$  output remains active, reflecting the state of the PLL.

**Deserializer Truth Table**

INPUTS		OUTPUTS		
$PWRDN$	$REN$	$ROUT[0:9]$	$\overline{LOCK}$	$RCLK$
H	H	Z	H	Z
H	H	Active	L	Active
L	X	Z	Z	Z
H	L	Z	Active	Z

NOTES: 1.  $\overline{LOCK}$  output reflects the state of the deserializer with regard to the selected data stream.  
2.  $RCLK$  active indicates the  $RCLK$  is running if the deserializer is locked. The timing of  $RCLK$  with respect to  $ROUT$  is determined by  $RCLK\_R/F$ .  
3.  $ROUT$  and  $RCLK$  are 3-stated when  $\overline{LOCK}$  is asserted high.

### failsafe biasing for the SN65LV1224A

The SN65LV1224A has an input threshold sensitivity of  $\pm 50$  mV. This allows for greater differential noise margin in the SN65LV1224A. However, in cases where the receiver input is not being actively driven, the increased sensitivity of the SN65LV1224A can pickup noise as a signal and cause unintentional locking. This may occur when the input cable is disconnected. SN65LV1224A has an on-chip fail-safe circuit that drives the serial input and  $\overline{LOCK}$  Signal high. The response time of the fail-safe circuit depends on interconnect characteristics.

## 10-MHz TO 66-MHz, 10:1 LVDS SERIALIZER/DESERIALIZER

SLLS570D – JUNE 2003 – REVISED JANUARY 2005

### Terminal Functions

#### serializer

PIN	NAME	DESCRIPTION
18, 20, 23, 25	AGND	Analog circuit ground (PLL and analog circuits)
17, 26	AVCC	Analog circuit power supply (PLL and analog circuits)
19	DEN	LVTTL logic input. Low puts the LVDS serial output into the high-impedance state. High enables serial data output.
15, 16	DGND	Digital circuit ground
3–12	D <sub>IN0</sub> – D <sub>IN9</sub>	Parallel LVTTL data inputs
21	D <sub>O</sub> –	Inverting LVDS differential output
22	D <sub>O</sub> +	Noninverting LVDS differential output
27, 28	DVCC	Digital circuit power supply
24	PWRDN	LVTTL logic input. Asserting this pin low turns off the PLL and places the outputs into the high-impedance state, putting the device into a low-power mode.
1, 2	SYNC1, SYNC2	LVTTL logic inputs SYNC1 and SYNC2 are ORed together. When at least one of the two pins is asserted high for 6 cycles of TCLK, the serializer initiates transmission of a minimum 1026 SYNC patterns. If after completion of the transmission of 1026 patterns SYNC continues to be asserted, then the transmission continues until SYNC is driven low and if the time SYNC holds > 6 cycles, another 1026 SYNC pattern transmission initiates.
13	TCLK_R/F	LVTTL logic input. Low selects a TCLK falling-edge data strobe; high selects a TCLK rising-edge data strobe.
14	TCLK	LVTTL-level reference clock input. The SN65LV1023A accepts a 10-MHz to 66-MHz clock. TCLK strobes parallel data into the input latch and provides a reference frequency to the PLL.

#### deserializer

PIN	NAME	DESCRIPTION
1, 12, 13	AGND	Analog circuit ground (PLL and analog circuits)
4, 11	AVCC	Analog circuit power supply (PLL and analog circuits)
14, 20, 22	DGND	Digital circuit ground
21, 23	DVCC	Digital circuit power supply
10	LOCK	LVTTL level output. LOCK goes low when the deserializer PLL locks onto the embedded clock edge.
7	PWRDN	LVTTL logic input. Asserting this pin low turns off the PLL and places outputs into a high-impedance state, putting the device into a low-power mode. To initiate power down, this pin is held low for a minimum of 16 ns. As long as PWRDN is held low, the device is in the power down state.
2	RCLK_R/F	LVTTL logic input. Low selects an RCLK falling-edge data strobe; high selects an RCLK rising-edge data strobe.
9	RCLK	LVTTL level output recovered clock. Use RCLK to strobe ROUTx.
3	REFCLK	LVTTL logic input. Use this pin to supply a REFCLK signal for the internal PLL frequency.
8	REN	LVTTL logic input. Low places R <sub>OUT0</sub> –R <sub>OUT9</sub> and RCLK in the high-impedance state.
5	R <sub>I</sub> +	Serial data input. Noninverting LVDS differential input
6	R <sub>I</sub> –	Serial data input. Inverting LVDS differential input
15–19, 24–28	R <sub>OUT0</sub> –R <sub>OUT9</sub>	Parallel LVTTL data outputs

**absolute maximum ratings (unless otherwise noted)†**

$V_{CC}$ to GND .....	–0.3 V to 4 V
LVTTL input voltage .....	–0.3 V to $(V_{CC} + 0.3)$ V
LVTTL output voltage .....	–0.3 V to $(V_{CC} + 0.3)$ V
LVDS receiver input voltage .....	–0.3 V to 3.9 V
LVDS driver output voltage .....	–0.3 V to 3.9 V
LVDS output short circuit duration .....	10 ms
Electrostatic discharge: HBM .....	up to 6 kV
MM .....	up to 200 V
Junction temperature .....	150°C
Storage temperature .....	–65°C to 150°C
Lead temperature (soldering, 4 seconds) .....	260°C
Maximum package power dissipation, $T_A = 25^\circ\text{C}$ .....	1.27 W
Package derating .....	10.3 mW/°C above 25°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

**recommended operating conditions**

	MIN	NOM	MAX	UNIT
Supply voltage, $V_{CC}$ ‡	3	3.3	3.6	V
Receiver input voltage range	0		2.4	V
Receiver input common mode range, $V_{CM}$	$\frac{V_{ID}}{2}$	$2.4 - \left(\frac{V_{ID}}{2}\right)$		V

## APPLICATION INFORMATION

### differential traces and termination

The performance of the SN65LV1023A/SN65LV1224A is affected by the characteristics of the transmission medium. Use controlled-impedance media and termination at the receiving end of the transmission line with the media's characteristics impedance.

Use balanced cables such as twisted pair or differential traces that are ran close together. A balanced cable picks up noise together and appears to the receiver as common mode. Differential receivers reject common-mode noise. Keep cables or traces matched in length to help reduce skew.

Running the differential traces close together helps cancel the external magnetic field, as well as maintain a constant impedance. Avoiding sharp turns and reducing the number of vias also helps.

### topologies

There are several topologies that the serializers can operate. Three common examples are shown below.

Figure 20 shows an example of a single-terminated point-to-point connection. Here a single termination resistor is located at the deserializer end. The resistor value should match that of the characteristic impedance of the cable or PC board traces. The total load seen by the serializer is  $100\ \Omega$ . Double termination can be used and typically reduces reflections compared with single termination. However, it also reduces the differential output voltage swing.

AC-coupling is only recommended if the parallel TX data stream is encoded to achieve a dc-balanced data stream. Otherwise the AC-caps can induce common mode voltage drift due to the dc-unbalanced data stream.

**Figure 20. Single-Terminated Point-to-Point Connection**

Figure 21 shows an example of a multidrop configuration. Here there is one transmitter broadcasting data to multiple receivers. A  $50\text{-k}\Omega$  resistor at the far end terminates the bus.

**Figure 21. Multidrop Configuration**

# SN65LV1023A/SN65LV1224A

## 10-MHz TO 66-MHz, 10:1 LVDS SERIALIZER/DESERIALIZER

SLLS570D – JUNE 2003 – REVISED JANUARY 2005

Figure 22 shows an example of multiple serializers and deserializers on the same differential bus, such as in a backplane. This is a multipoint configuration. In this situation, the characteristic impedance of the bus can be significantly less due to loading. Termination resistors that match the loaded characteristic impedance are required at each end of the bus. The total load seen by the serializer in this example is  $27 \Omega$ .

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - May not be currently available - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**None:** Not yet available Lead (Pb-Free).

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean "Pb-Free" and in addition, uses package materials that do not contain halogens, including bromine (Br) or antimony (Sb) above 0.1% of total product weight.

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDECindustry standard classifications, and peak solder temperature.

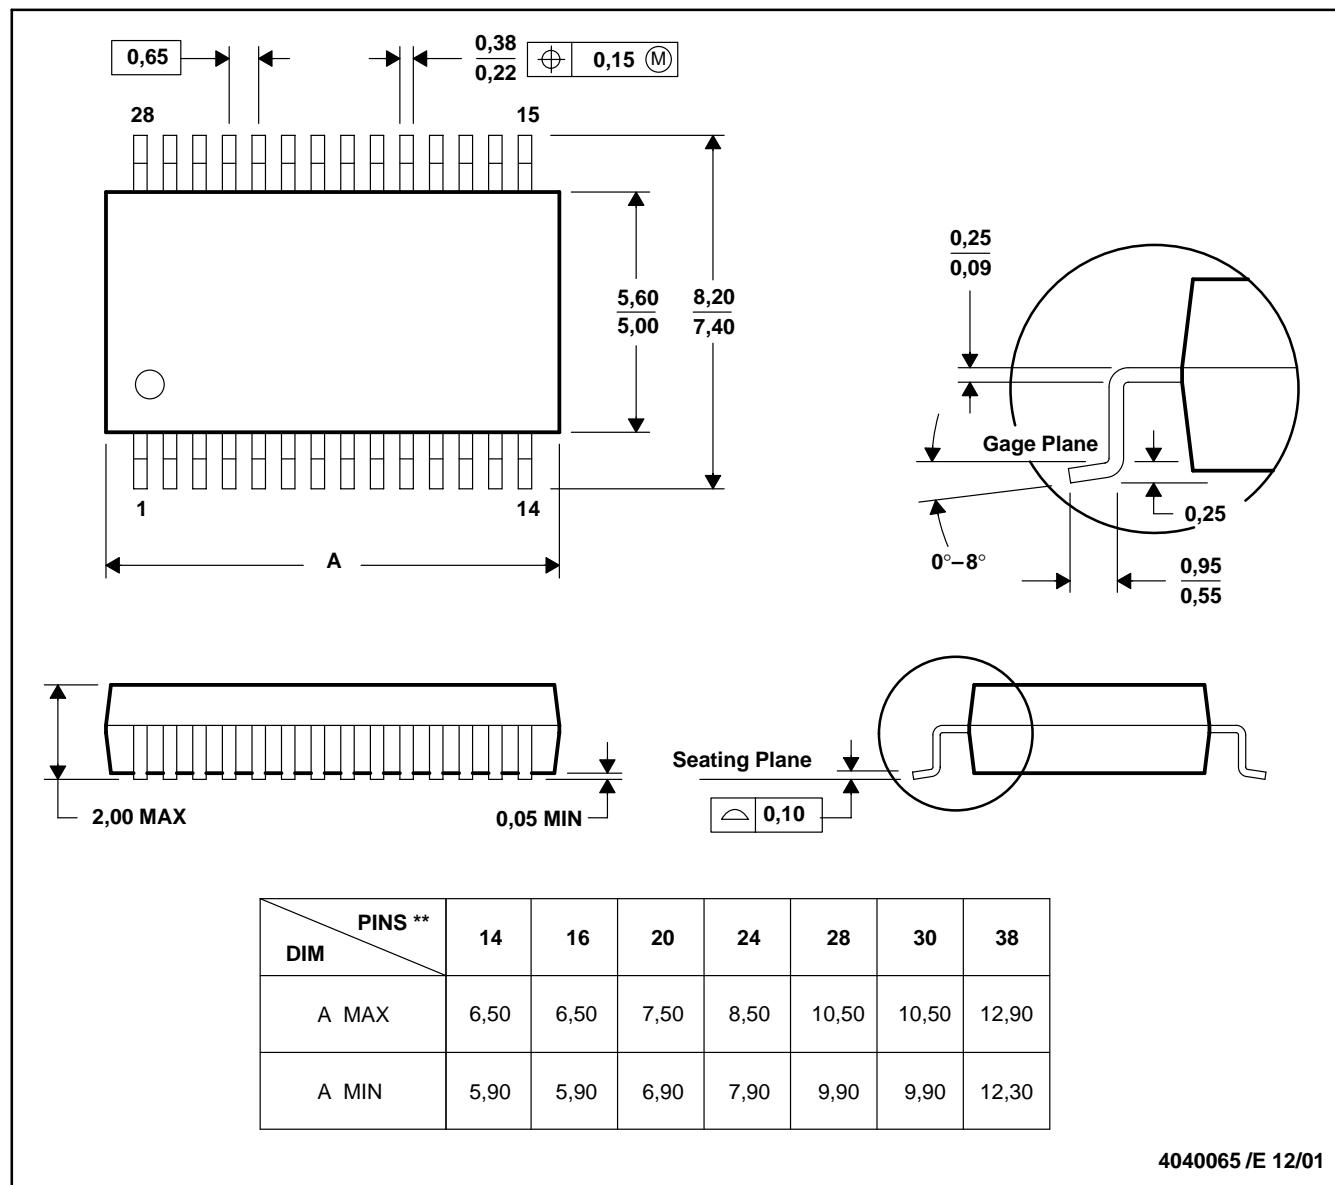

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. ## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
