DESCRIPTION

The GR881 is a 8192 word by 8 bits (8K x 8) non-volatile CMOS Static Ram, fabricated from advanced silicon gate CMOS technology and a high reliability lithium power cell.

The pin-out of the GR881 conforms to the JEDEC standards and is fully compatible with normal static RAM.

The power down circuit is fully automatic and is referenced at 4.5 volts. At this point the GR881 is write protected by an internal inhibit function for Data Protection and the memory contents are retained by the lithium power source.

Power down is very fast, this being essential for data integrity, taking a maximum of 15 µS (15 microseconds) to power down from 5 volts to 0 volts. This is much faster than system power failure conditions. Therefore there are no special conditions required when installing the GR881.

The GR881 can, without external power, retain data almost indefinitely. The limiting factor will be the shelf life of the lithium cell, which is typically ten years. It is possible that this figure may be extended in view of the extremely light duty imposed upon the cell.

APPLICATION

When powered down, the GR881 is transportable and data can be moved from system to system, this makes it ideal for program development, data collection in data loggers, program changes in process control, automation and robotics and user definable lookup tables, etc.

DISPOSAL INSTRUCTIONS

Do not dispose of non-volatile memory devices by incineration or crushing. Devices may be returned carriage paid to Greenwich Instruments Ltd., for disposal.

GR881 (8K x 8) NON-VOLATILE RAM

TIMING (nS-nano seconds)

Symbol	Parameter	Min	Max
tRC	Read cycle time	100	
tACC	Access time		100
tACS	CE to output valid		100
tOE	OE to output valid		40
tCLZ	CE to output active	10	
tOLZ	OE to output active	5	
tOH	Output hold time	10	
tCHZ	CE to output disable		30
tOHZ	OE to output disable		20

Write Cycle

Symbol	Parameter	Min	Max
tWC	Write cycle time	100	
tWP	Write pulse width	60	
tAS	Address setup time	0	
tWR	Write recovery time	0	
tWHZ	WR to output disable		30
tOW	Output active from WR	10	
tDS	Data setup time	40	
tDH	Data HOLD TIME	0	

Notes

1. WE must be high during address transitions.
2. A Write occurs during the overlap of active CE and a low WE.
3. CE = CE1 and CE2
4. WE is high for a read cycle.
