

Data Sheet

CMA3000-A01 3-AXIS LOW POWER ANALOG OUTPUT ACCELEROMETER

Features

- 1.7 V – 3.6 V supply voltage
- Ratiometric analog voltage output for x, y and z acceleration
- User selectable ± 2 g and ± 8 g measurement ranges
- Low current consumption
 - Active 180 μ A
 - Power down < 0.1 μ A
- Size 2x2x0.95 mm³
- Proven capacitive 3D-MEMS technology
- High shock durability
- RoHS compliant / lead free soldering

Applications

CMA3000-A01 is targeted to battery operated devices. Typical applications are but not limited

- Gaming input devices
- Computer peripherals
- Free fall detection
- Activity monitoring

** Qualified during product validation

1) The product is factory calibrated at 2.5 V in room temperature.

2) Typical values are not guaranteed.

3) Z-axis +1g position. Soldering process can cause offset shift which is typically less than 150 mg. Please see TN68_CMA3000_Assembly_Instructions for further details.

4) Offset temperature error = {Vout(0g)-Offset} / Sensitivity [g]. Sensitivity = Calibrated sensitivity. Offset= Calibrated offset.

5) Sensitivity = {Vout(+1g) – Vout(-1g)}/2 [V/g] .

6) Sensitivity temperature error = {[Vout(+1g)-Vout(-1g)]/2 – Sensitivity} / Sensitivity x 100% [%].

Sensitivity = Calibrated sensitivity.

7) Best fit straight line.

8) The cross-axis sensitivity determines how much acceleration, perpendicular to the measuring axis, couples to the output. The total cross-axis sensitivity is the geometric sum of the sensitivities of the two axes which are perpendicular to the measuring axis. The angular alignment error between X, Y and Z axis is included into the cross axis sensitivity.

9) Frequency response -3dB roll off frequency = $1/(2\pi \cdot 32k\Omega \cdot C_L)$, when $C_L \geq 50$ nF.

10) Average noise/axis over the measurement bandwidth defined as $\sqrt{\frac{1}{3}(n_x^2 + n_y^2 + n_z^2)}$, where n_x , n_y and n_z are the measured signal's standard deviation due to noise in x, y and z directions.
