

CMOS Analog Switches

IH5048-IH5051

General Description

Maxim's IH5048-IH5051 analog switches are designed for applications requiring low leakage. They feature extremely low on resistance (30Ω typical) as well as quiescent power-supply current below 1μA. Switch control inputs are fully compatible with both CMOS and TTL logic.

These switches are plug-in upgrades for the original manufacturer's devices, with improved specifications for analog-signal range and switch on and off times. They are also pin-compatible with the IH5040 family of analog switches. The IH5048 series is supplied in 16-pin DIP and SO packages.

Applications

Precision Sample-and-Hold Circuits
Transducer and Sensor Switching
Low-Level Signal Conditioning
Battery-Powered Instrumentation
Programmable-Gain Amplifiers

Features

- ◆ Low Charge Injection (10pC Typ)
- ◆ Quiescent Current Below 1mA
- ◆ TTL and CMOS Compatible
- ◆ Low On Resistance (25Ω Max for IH5048A)
- ◆ Latchup-Proof Construction

Note 1: Signals on S, D, and digital inputs that exceed V- or V+ will be clamped by internal diodes. Limit forward diode current to 30mA maximum.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
