

Features

- Very high speed: 45 ns
- Wide voltage range: 2.20 V to 3.60 V
- Pin compatible with CY62136CV30
- Ultra low standby power
 - Typical standby current: 1 μ A
 - Maximum standby current: 7 μ A
- Ultra low active power
 - Typical active current: 2 mA at f = 1 MHz
- Easy memory expansion with $\overline{\text{CE}}$ and $\overline{\text{OE}}$ features
- Automatic power down when deselected
- Complementary metal oxide semiconductor (CMOS) for optimum speed/power
- Offered in a Pb-free 48-ball very fine ball grid array (VFBGA) and 44-pin thin small outline package (TSOP II) packages

Functional Description

The CY62136EV30 is a high performance CMOS static RAM organized as 128K words by 16 bits. This device features advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption when addresses are not toggling. The device can also be put into standby mode reducing power consumption by more than 99% when deselected ($\overline{\text{CE}}$ HIGH). The input/output pins (I/O_0 through I/O_{15}) are placed in a high impedance state when: deselected ($\overline{\text{CE}}$ HIGH), outputs are disabled ($\overline{\text{OE}}$ HIGH), both Byte High Enable and Byte Low Enable are disabled ($\overline{\text{BHE}}$, $\overline{\text{BLE}}$ HIGH), or during a write operation ($\overline{\text{CE}}$ LOW and $\overline{\text{WE}}$ LOW).

Writing to the device is accomplished by taking Chip Enable ($\overline{\text{CE}}$) and Write Enable ($\overline{\text{WE}}$) inputs LOW. If Byte Low Enable ($\overline{\text{BLE}}$) is LOW, then data from I/O pins (I/O_0 through I/O_7), is written into the location specified on the address pins (A_0 through A_{16}). If Byte High Enable ($\overline{\text{BHE}}$) is LOW, then data from I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{16}).

Reading from the device is accomplished by taking Chip Enable ($\overline{\text{CE}}$) and Output Enable ($\overline{\text{OE}}$) LOW while forcing the Write Enable ($\overline{\text{WE}}$) HIGH. If Byte Low Enable ($\overline{\text{BLE}}$) is LOW, then data from the memory location specified by the address pins appear on I/O_0 to I/O_7 . If Byte High Enable ($\overline{\text{BHE}}$) is LOW, then data from memory appear on I/O_8 to I/O_{15} . See the [Truth Table on page 11](#) for a complete description of read and write modes.

Notes

- NC pins are not connected on the die.
- Pins D3, H1, G2, H6 and H3 in the VFBGA package are address expansion pins for 4 Mb, 8 Mb, 16 Mb, and 32 Mb and 64 Mb respectively.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = V_{CC(typ)}, T_A = 25 °C.

Maximum Ratings

Exceeding the maximum ratings may impair the useful life of the device. These user guidelines are not tested.

I_{SB2} [8]	Automatic CE power-down current – CMOS inputs	$\overline{CE} \geq V_{CC} - 0.2\ V$, $V_{IN} \geq V_{CC} - 0.2\ V$ or $V_{IN} \leq 0.2\ V$, $f = 0$, $V_{CC} = 3.60\ V$	–	1	7	μA

Notes

- $V_{IL(min.)} = -2.0\ V$ for pulse durations less than 20 ns.
- $V_{IH(max.)} = V_{CC} + 0.75\ V$ for pulse durations less than 20 ns.
- Full Device AC operation assumes a 100 μs ramp time from 0 to $V_{CC(min)}$ and 200 μs wait time after V_{CC} stabilization.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at $V_{CC} = V_{CC(typ.)}$, $T_A = 25\ ^\circ C$.
- Chip enable (\overline{CE}) and byte enables (\overline{BHE} and \overline{BLE}) need to be tied to CMOS levels to meet the $I_{SB1}/I_{SB2}/I_{CCDR}$ specification. Other inputs can be left floating.

Notes

10. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at $V_{CC} = V_{CC(typ.)}$, $T_A = 25\text{ }^{\circ}\text{C}$.

11. Chip enable (\overline{CE}) and byte enables (\overline{BHE} and \overline{BLE}) need to be tied to CMOS levels to meet the I_{SB1} / I_{SB2} / I_{CCDR} specification. Other inputs can be left floating.

12. Tested initially and after any design or process changes that may affect these parameters.

13. Full device operation requires linear V_{CC} ramp from V_{DR} to $V_{CC(min.)} \geq 100\text{ }\mu\text{s}$ or stable at $V_{CC(min.)} \geq 100\text{ }\mu\text{s}$.

14. $\overline{BHE.BLE}$ is the AND of both \overline{BHE} and \overline{BLE} . The chip can be deselected by either disabling the chip enable signals or by disabling both \overline{BHE} and \overline{BLE} .

Notes

- Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns (1 V/ns) or less, timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} as shown in Figure 3 on page 5.
- In an earlier revision of this device, under a specific application condition, READ and WRITE operations were limited to switching of the byte enable and/or chip enable signals as described in the Application Notes AN13842 and AN66311. However, the issue has been fixed and in production now, and hence, these Application Notes are no longer applicable. They are available for download on our website as they contain information on the date code of the parts, beyond which the fix has been in production.
- At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
- t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
- The internal write time of the memory is defined by the overlap of \overline{WE} , $\overline{CE} = V_{IL}$, \overline{BHE} and $\overline{BLE} = V_{IL}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.
- The minimum write pulse for Write Cycle No. 3 (\overline{WE} Controlled and \overline{OE} LOW) should be sum of t_{HZWE} and t_{SD} .

Figure 7. Write Cycle No. 1: \overline{WE} Controlled [24, 25, 26]

Figure 8. Write Cycle No. 2: \overline{CE} Controlled [24, 25, 26]

Notes

24. The internal write time of the memory is defined by the overlap of \overline{WE} , $\overline{CE} = V_{IL}$, \overline{BHE} and $\overline{BLE} = V_{IL}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.

25. Data I/O is high impedance if $\overline{OE} = V_{IH}$.

26. If \overline{CE} goes HIGH simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.

27. During this period, the I/Os are in output state and input signals should not be applied.

Notes

28. If \overline{CE} goes HIGH simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.
 29. The minimum write cycle pulse width should be equal to the sum of t_{HZWE} and t_{SD} .
 30. During this period, the I/Os are in output state and input signals should not be applied.

Cypress products are not designed, intended, or authorized for use as critical components in systems designed or intended for the operation of weapons, weapons systems, nuclear installations, life-support devices or systems, other medical devices or systems (including resuscitation equipment and surgical implants), pollution control or hazardous substances management, or other uses where the failure of the device or system could cause personal injury, death, or property damage ("Unintended Uses"). A critical component is any component of a device or system whose failure to perform can be reasonably expected to cause the failure of the device or system, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from or related to all Unintended Uses of Cypress products. You shall indemnify and hold Cypress harmless from and against all claims, costs, damages, and other liabilities, including claims for personal injury or death, arising from or related to any Unintended Uses of Cypress products.
