

### Low Noise, Low Power I<sup>2</sup>C<sup>®</sup> Bus, 256 Taps

The ISL90842 integrates four digitally controlled potentiometers (DCP) configured as variable resistors on a monolithic CMOS integrated circuit.

The digitally controlled potentiometers are implemented with a combination of resistor elements and CMOS switches. The position of the wipers are controlled by the user through the I<sup>2</sup>C bus interface. Each potentiometer has an associated Wiper Register (WR) that can be directly written to and read by the user. The contents of the WR controls the position of the wiper.

The DCPs can be used as two-terminal variable resistors in a wide variety of applications including control, parameter adjustments, and signal processing.

### Features

- Four variable resistors in one package
- 256 resistor taps - 0.4% resolution
- I<sup>2</sup>C serial interface
- Wiper resistance: 70Ω typical @ 3.3V
- Standby current <5μA max
- Power supply: 2.7V to 5.5V
- 50kΩ, 10kΩ total resistance
- 14 Lead TSSOP
- Pb-free plus anneal available (RoHS compliant)

### Ordering Information

| PART NUMBER                    | PART MARKING | RESISTANCE OPTION (Ω) | TEMP RANGE (°C) | PACKAGE               |
|--------------------------------|--------------|-----------------------|-----------------|-----------------------|
| ISL90842UIV1427Z (Notes 1 & 2) | 90842UI27Z   | 50K                   | -40 to +85      | 14 Ld TSSOP (Pb-Free) |
| ISL90842WIV1427Z (Notes 1 & 2) | 90842WI27Z   | 10K                   | -40 to +85      | 14 Ld TSSOP (Pb-Free) |

#### NOTES:

1. Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
2. Add "-TK" suffix for Tape and Reel.

## Pin Descriptions

| TSSOP PIN | SYMBOL | DESCRIPTION                                        |
|-----------|--------|----------------------------------------------------|
| 1         | RH3    | "High" terminal of DCP3                            |
| 2         | RW3    | "Wiper" terminal of DCP3                           |
| 3         | SCL    | I <sup>2</sup> C interface clock                   |
| 4         | SDA    | Serial data I/O for the I <sup>2</sup> C interface |
| 5         | GND    | Device ground pin                                  |
| 6         | RW2    | "Wiper" terminal of DCP2                           |
| 7         | RH2    | "High" terminal of DCP2                            |
| 8         | RW1    | "Wiper" terminal of DCP1                           |
| 9         | RH1    | "High" terminal of DCP1                            |
| 10        | A0     | Device address for the I <sup>2</sup> C interface  |
| 11        | A1     | Device address for the I <sup>2</sup> C interface  |
| 12        | VCC    | Power supply pin                                   |
| 13        | RH0    | "High" terminal of DCP0                            |
| 14        | RW0    | "Wiper" terminal of DCP0                           |

### Absolute Maximum Ratings

|                                                          |                            |
|----------------------------------------------------------|----------------------------|
| Storage temperature                                      | -65°C to +150°C            |
| Voltage at any digital interface pin with respect to GND | -0.3V to $V_{CC}+0.3$      |
| $V_{CC}$                                                 | -0.3V to +6V               |
| Voltage at any DCP pin with respect to GND               | -0.3V to $V_{CC}$          |
| Lead temperature (soldering, 10s)                        | 300°C                      |
| $I_W$ (10s)                                              | ±6mA                       |
| Latchup                                                  | Class II, Level B at +85°C |
| ESD                                                      | >2kV Human Body Model      |

### Recommended Operating Conditions

|                           |                |
|---------------------------|----------------|
| Industrial                | -40°C to +85°C |
| $V_{CC}$                  | 2.7V to 5.5V   |
| Power rating of each DCP  | .5mW           |
| Wiper current of each DCP | ±3.0mA         |

**CAUTION:** Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

### Analog Specifications Over recommended operating conditions unless otherwise stated.

**A0 and A1 Pin Timing**

NOTES:

1. Typical values are for  $T_A = 25^\circ\text{C}$  and 3.3V supply voltage.
2.  $MI = |R_{255} - R_0| / 255$ .  $R_{255}$  and  $R_0$  are the measured resistances for the DCP register set to FF hex and 00 hex, respectively.
3.  $R_{offset} = R_{255} / MI$ , when measuring between  $R_W$  and  $R_H$ .
4.  $RDNL = (R_i - R_{i-1}) / MI$ , for  $i = 32$  to 255.
5.  $RINL = [R_i - (MI \cdot i) - R_0] / MI$ , for  $i = 32$  to 255.
6.  $R_{MATCH} = (R_{i,x} - R_{i,y}) / MI$ , for  $i = 0$  to 255,  $x = 0$  to 3 and  $y = 0$  to 3.
7.  $TC_R = \frac{[Max(R_i) - Min(R_i)]}{[Max(R_i) + Min(R_i)]/2} \times \frac{10^6}{125^\circ\text{C}}$  for  $i = 32$  to 255,  $T = -40^\circ\text{C}$  to  $85^\circ\text{C}$ .  $Max()$  is the maximum value of the resistance and  $Min()$  is the minimum value of the resistance over the temperature range.
8. This parameter is not 100% tested.

## Principles of Operation

The ISL90842 is an integrated circuit incorporating four DCPs with their associated registers, and an I<sup>2</sup>C serial interface providing direct communication between a host and the DCPs.

### DCP Description

Each DCP is implemented with a combination of resistor elements and CMOS switches. The physical ends of each DCP are equivalent to the fixed terminals of a mechanical potentiometer. The  $R_W$  pin of each DCP is connected to intermediate nodes, and is equivalent to the wiper terminal of a mechanical potentiometer. The position of the wiper terminal within the DCP is controlled by an 8-bit volatile Wiper Register (WR). Each DCP has its own WR. When the WR of a DCP contains all zeroes (WR<7:0>: 00h), its wiper terminal ( $R_W$ ) is closest to its  $R_L$  terminal. When the WR of a DCP contains all ones (WR<7:0>: FFh), its wiper terminal ( $R_W$ ) is furthest from the  $R_H$  terminal. As the value of the WR increases from all zeroes (00h) to all ones (255 decimal), the wiper moves monotonically from the position furthest from  $R_H$  to a position closer to  $R_H$ . At the same time, the resistance between  $R_H$  and  $R_W$  decreases monotonically. Note that the  $R_L$  terminals for all four pots are not connected (left floating).

While the ISL90842 is being powered up, all four WRs are reset to 80h (128 decimal), which locates  $R_W$  roughly at a position which yields a rheostat setting that is about 1/2 of  $R_{TOTAL}$ .

The WRs can be read or written directly using the I<sup>2</sup>C serial interface as described in the following sections. The I<sup>2</sup>C interface Address Byte has to be set to 00h, 01h, 02h, and 03h to access the WR of DCP0, DCP1, DCP2, and DCP3, respectively.

receiver pulls the SDA line LOW to acknowledge the

## I<sup>2</sup>C Serial Interface

The ISL90842 supports a bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master always initiates data transfers and provides the clock for both transmit and receive operations. Therefore, the ISL90842 operates as a slave device in all applications.

All communication over the I<sup>2</sup>C interface is conducted by sending the MSB of each byte of data first.

### Protocol Conventions

Data states on the SDA line must change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating START and STOP conditions (See Figure 9). On power-up of the ISL90842 the SDA pin is in the input mode.

All I<sup>2</sup>C interface operations must begin with a START condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The ISL90842 continuously monitors the SDA and SCL lines for the START condition and does not respond to any command until this condition is met (See Figure 9). A START condition is ignored during the power-up of the device.

All I<sup>2</sup>C interface operations must be terminated by a STOP condition, which is a LOW to HIGH transition of SDA while SCL is HIGH (See Figure 9). A STOP condition at the end of a read operation, or at the end of a write operation places the device in its standby mode.

An ACK, Acknowledge, is a software convention used to indicate a successful data transfer. The transmitting device, either master or slave, releases the SDA bus after transmitting eight bits. During the ninth clock cycle, the reception of the eight bits of data (See Figure 10).

The ISL90842 responds with an ACK after recognition of a START condition followed by a valid Identification Byte, and once again after successful receipt of an Address Byte. The ISL90842 also responds with an ACK after receiving a Data Byte of a write operation. The master must respond with an ACK after receiving a Data Byte of a read operation

A valid Identification Byte contains 01010 as the five MSBs, and the following two bits matching the logic values present at pins A1 and A0. The LSB is the Read/Write bit. Its value is

“1” for a Read operation, and “0” for a Write operation (See Table 1).

TABLE 1. IDENTIFICATION BYTE FORMAT

Logic values at pins A1, and A0 respectively

|       |   |   |   |   |    |    |       |
|-------|---|---|---|---|----|----|-------|
| 0     | 1 | 0 | 1 | 0 | A1 | A0 | R/W   |
| (MSB) |   |   |   |   |    |    | (LSB) |

FIGURE 9. VALID DATA CHANGES, START, AND STOP CONDITIONS

FIGURE 10. ACKNOWLEDGE RESPONSE FROM RECEIVER

FIGURE 11. BYTE WRITE SEQUENCE

FIGURE 12. READ SEQUENCE

### Write Operation

A Write operation requires a START condition, followed by a valid Identification Byte, a valid Address Byte, a Data Byte, and a STOP condition. After each of the three bytes, the ISL90842 responds with an ACK. At this time, the device enters its standby state (See Figure 11).

### Read Operation

A Read operation consists of a three byte instruction followed by one or more Data Bytes (See Figure 12). The master initiates the operation issuing the following sequence: a START, the Identification byte with the R/W bit set to "0", an Address Byte, a second START, and a second Identification byte with the R/W bit set to "1". After each of the three bytes, the ISL90842 responds with an ACK. Then the ISL90842 transmits Data Bytes as long as the master responds with an ACK during the SCL cycle following the eighth bit of each byte. The master terminates the read operation (issuing a STOP condition) following the last bit of the last Data Byte (See Figure 12).

The Data Bytes are from the registers indicated by an internal pointer. This pointer initial value is determined by the Address Byte in the Read operation instruction, and increments by one during transmission of each Data Byte. After reaching the memory location 03h the pointer "rolls over" to 00h, and the device continues to output data for each ACK received.

## Packaging Information
