## **STORAGE, HANDLING AND INSPECTION**

Brushes should be stored in their original boxes in conditions which do not expose them to high humidity, heat, acids or any other liquids which can result in deterioration of the fill material and subsequent premature failure.

When brushes are removed from their boxes they should be checked and not used if there are any signs of damage or corrosion.

## **MACHINE CONDITION AND BRUSH MOUNTING**

Any operating instructions supplied with the machine should be closely followed and all guards should be in place at all times, the machine should have sufficient power and the maximum size of brush specified for the machine should never be exceeded.

When mounting the brush check that the machine speed does not exceed the maximum speed specified for the brush, check that the fit of the brush on the machine spindle is good and that it is firmly secured.

For brushes which have a threaded bore check that the thread size in the brush is the same as the machine spindle.

Always secure circular plain bore brushes by clamping the sideplates of the brush, if plastic bore adaptor bushes are supplied they are for location purposes only and not for clamping.

If the machine has a work rest make sure that it is correctly adjusted to the brush.

## **PROTECTIVE EQUIPMENT**

The potential for injury exists for both the machine operator and others in the work area because the material being removed by the brush e.g. burrs, scale and slag etc. together with broken wires from the brush will fly off the brush with considerable speed and force, therefore eye protection equipment must be worn at all times by the operator and others in the work area.

In some cases the wearing of protective clothing may be necessary and the use of safety screens to protect other personnel.
