

Improved Precision Micropower Shunt Voltage Reference

LM4041

General Description

The LM4041 is a precision two-terminal shunt mode, bandgap voltage reference with a fixed reverse breakdown voltage of 1.225V. Ideal for space-critical applications, the LM4041 is offered in the subminiature 3-pin SC70 surface-mount package (1.8mm × 1.8mm), 50% smaller than comparable devices in SOT23 surface-mount packages (SOT23 versions are also available).

Laser-trimmed resistors ensure precise initial accuracy. With a 100ppm/°C temperature coefficient, the device is offered in four grades of initial accuracy ranging from 0.1% to 1%. The LM4041 has a 60μA to 12mA shunt current capability with low dynamic impedance, ensuring stable reverse breakdown voltage accuracy over a wide range of operating temperatures and currents.

The LM4041 does not require an external stabilizing capacitor while ensuring stability with any capacitive load.

Features

- ◆ Ultra-Small 3-Pin SC70 Package
- ◆ 0.1% max Initial Accuracy
- ◆ 100ppm/°C max Temperature Coefficient
Guaranteed over -40°C to +85°C Temperature Range
- ◆ Wide Operating Current Range: 60μA to 12mA
- ◆ Low 20μVRMS Output Noise (10Hz to 10kHz)
- ◆ 1.225V Fixed Reverse Breakdown Voltage
- ◆ No Output Capacitors Required
- ◆ Tolerates Capacitive Loads

			LM4041D		0.5	2.0	
Wideband Noise	e_N	$I_R = 100\mu\text{A}$, $10\text{Hz} \leq f \leq 10\text{kHz}$			20		μVRMS
Reverse Breakdown Voltage Long-Term Stability	ΔV_R	$T = 1000\text{h}$, $I_R = 100\mu\text{A}$			120		ppm

Note 1: All devices are 100% production tested at $+25^\circ\text{C}$ and are guaranteed by design for $T_A = T_{\text{MIN}}$ to T_{MAX} , as specified.

Note 2: The overtemperature limit for Reverse Breakdown Voltage Tolerance is defined as the room-temperature Reverse Breakdown Voltage Tolerance $\pm[(\Delta V_R / \Delta T)(\max \Delta T)(V_R)]$, where $\Delta V_R / \Delta T$ is the V_R temperature coefficient, $\max \Delta T$ is the maximum difference in temperature from the reference point of $+25^\circ\text{C}$ to T_{MIN} or T_{MAX} , and V_R is the reverse breakdown voltage. The total overtemperature tolerance for the different grades in the temperature range where $\max \Delta T = +65^\circ\text{C}$ is shown below:

A grade: $\pm 0.75\% = \pm 0.1\% \pm 100 \text{ ppm}/^\circ\text{C} \times 65^\circ\text{C}$
 B grade: $\pm 0.85\% = \pm 0.2\% \pm 100 \text{ ppm}/^\circ\text{C} \times 65^\circ\text{C}$
 C grade: $\pm 1.15\% = \pm 0.5\% \pm 100 \text{ ppm}/^\circ\text{C} \times 65^\circ\text{C}$
 D grade: $\pm 1.98\% = \pm 1.0\% \pm 150 \text{ ppm}/^\circ\text{C} \times 65^\circ\text{C}$

Note 3: Guaranteed by design.

Improved Precision Micropower Shunt Voltage Reference

LM4041

Detailed Description

The LM4041 shunt references use the bandgap principle to produce a stable, accurate voltage. The device behaves similarly to an ideal zener diode; a fixed voltage of +1.225V is maintained across its output terminals when biased with 60μA to 12mA of reverse current. The LM4041 behaves similarly to a silicon diode when biased with forward currents up to 10mA.

Figure 3 shows a typical operating circuit. The LM4041 is ideal for providing a stable reference from a high-voltage power supply.

Applications Information

The LM4041's internal pass transistor is used to maintain a constant output voltage (V_{SHUNT}) by sinking the necessary amount of current across a source resistor. The source resistance (R_S) is determined from the load current (I_{LOAD}) range, supply voltage (V_S) variations, V_{SHUNT} , and desired quiescent current.

Choose the value of R_S when V_S is at a minimum and I_{LOAD} is at a maximum. Maintain a minimum I_{SHUNT} of 60μA at all times. The R_S value should be large enough to keep I_{SHUNT} less than 12mA for proper regulation when V_S is maximum and I_{LOAD} is at a minimum. To prevent damage to the device, I_{SHUNT} should never exceed 20mA.

Therefore, the value of R_S is bounded by the following equation:

$$\frac{[V_S(\text{MIN}) - V_R]}{[60\mu\text{A} + I_{LOAD}(\text{MAX})]} > R_S > \frac{[V_S(\text{MAX}) - V_R]}{[20\text{mA} + I_{LOAD}(\text{MIN})]}$$

Choosing a larger resistance minimizes the total power dissipation in the circuit by reducing the shunt current ($P_{D(TOTAL)} = V_S \times I_{SHUNT}$). Provide a safety margin to incorporate the worst-case tolerance of the resistor used. Ensure that the resistor's power rating is adequate, using the following general power equation:

$$P_R = I_{SHUNT} \times (V_S(\text{MAX}) - V_R)$$

Figure 3. Typical Operating Circuit

Output Capacitance

The LM4041 does not require an external capacitor for frequency stability and is stable for any output capacitance.

Temperature Performance

The LM4041 typically exhibits an output voltage temperature coefficient within $\pm 15\text{ppm}/^\circ\text{C}$. The polarity of the temperature coefficient may be different from one device to another; some may have positive coefficients, and others may have negative coefficients.
