

**10 Hz - 102.4 kHz
4-Bit Programmable**

**32-Pin DIP
8-Pole Filters**

Description

The 428 Series are 8-pole digitally programmable low-pass and high-pass active filters. These new filters take advantage of the company's proprietary designs using surface-mount technology to provide a low profile, compact package in minimal board space. 428 filters are factory tuned to one of ten preset 4-bit binary ranges from 10 Hz to 102.4 kHz. Contact the factory for custom discrete tuning ranges, maximum span 1000:1.

All 428 Series models are easy to use fully finished filters which require no external components or adjustment. They feature low harmonic distortion, near theoretical phase and amplitude characteristics and operate over a dynamic input voltage range from non-critical $\pm 12V$ to $\pm 18V$ power supplies.

Features/Benefits:

- Low harmonic distortion and wide signal-to-noise ratio to 16-bit resolution.
- Compact 1.8"L x 0.8"W x 0.3"H min. (32-pin DIP footprint) minimizes board space requirements.
- Digitally programmable corner frequency allows selecting cut-off frequencies specific to each application.
- Plug-in ready-to-use, reducing engineering design and manufacturing cycle time.
- Factory tuned, no external clocks or adjustments needed.
- Broad range of transfer characteristics and corner frequencies to meet a wide range of applications.

Applications

- Anti-alias filtering
- Data acquisition systems
- Communication systems and electronics
- Medical electronics equipment and research
- Aerospace, navigation and sonar applications
- Acoustic and vibration analysis and control
- Real and compressed time data analysis
- Noise elimination
- Signal reconstruction

Digital Tuning & Control Characteristics

4-Bit Programmable Filters

Digital Tuning Characteristics

The digital tuning interface circuits are a parallel set of CMOS switches which accept CMOS compatible inputs for the four tuning bits ($D_0 - D_3$).

Binary Tuning Range

MSB	---	---	LSB	Bit Weight
2^3 D_3	2^2 D_2	2^1 D_1	2^0 D_0	fc - corner frequency
0	0	0	0	$f_{\max}/16$
0	0	0	1	$f_{\max}/8$
0	0	1	1	$f_{\max}/4$
0	1	1	1	$f_{\max}/2$
1	1	1	1	$f_{\max}$

Binary Tuning Equation:

$$fc = (f_{\max}/16) [1 + D_3 \times 2^3 + D_2 \times 2^2 + D_1 \times 2^1 + D_0 \times 2^0]$$

where $D_1 - D_3 = "0"$ or $"1"$, and

$f_{\max}$ = Maximum tuning frequency

fc = Corner frequency;

Minimum tunable frequency = $f_{\max}/16$ (D_0 thru $D_3 = 0$);

Minimum frequency step (Resolution) = $f_{\max}/16$

Discrete Frequencies

F	D_0	D_1	D_2	D_3
F_B	0	0	0	0
F_1	1	0	0	0
F_2	1	1	0	0
F_3	1	1	1	0
F_4	1	1	1	1

Discrete Tuning Equation:

$$fc = F_B + D_0[\Delta f_0] + D_1[\Delta f_1] + D_2[\Delta f_2] + D_3[\Delta f_3]$$

$\Delta f_0, \Delta f_1, \Delta f_2, \Delta f_3$ are the incremental frequency shifts for the data bits D_0, D_1, D_2 and D_3 . They are selected to realize the five customer specified programming frequencies $F_B \Rightarrow F_4$. Other programming codes produce valid fc's between F_B and F_4 .

Pin-Out Key

IN	Analog Input Signal	D_3	Tuning Bit 3 (MSB)
OUT	Analog Output Signal	D_2	Tuning Bit 2
GND	Power and Signal Return	D_1	Tuning Bit 1
+Vs	Supply Voltage, Positive	D_0	Tuning Bit 0 (LSB)
-Vs	Supply Voltage, Negative	+5V	Logic Power
Os	Offset Adjustment

Specification

(25°C and $V_s \pm 15$ Vdc)

Analog Input Characteristics¹

Impedance	10 k Ω min.
Voltage Range	± 10 Vpeak
Max. Safe Voltage	$\pm V_s$

Analog Output Characteristics

Impedance (Closed Loop)	1 Ω typ. 10 Ω max.
Linear Operating Range	± 10 V
Maximum Current ²	± 2 mA
Offset Voltage ³	2 mV typ. 20 mV max.
Offset Temp. Coeff.	50 μ V/°C

Power Supply ($\pm V$)

Rated Voltage	± 15 Vdc
Operating Range	± 12 to ± 18 Vdc
Maximum Safe Voltage	± 18 Vdc
Quiescent Current	± 25 mA typ. ± 40 mA max.

Temperature

Operating	0 to +70°C
Storage	-25 to +85°C

Notes:

1. Input and output signal voltage referenced to supply common.
2. Output is short circuit protected to common.
DO NOT CONNECT TO $\pm V_s$.
3. Adjustable to zero.
4. Units operate with or without offset pin connected.

1. Normalized Group Delay:

The above delay data is normalized to a corner frequency of 1.0Hz. The actual delay is the normalized delay divided by the actual corner frequency (fc).

$$\text{Actual Delay} = \frac{\text{Normalized Delay}}{\text{Actual Corner Frequency (fc) in Hz}}$$

Frequency Response

1. Normalized Group Delay:

The above delay data is normalized to a corner frequency of 1.0Hz. The actual delay is the normalized delay divided by the actual corner frequency (fc).

$$\text{Actual Delay} = \frac{\text{Normalized Delay}}{\text{Actual Corner Frequency (fc) in Hz}}$$

Theoretical Transfer Characteristics
