High Speed Dual 3-Input/ 3-Output OR/NOR Gate

The MC10212 is designed to drive up to six transmission lines simultaneously. The multiple outputs of this device also allow the wire "OR"-ing of several levels of gating for minimization of gate and package count.

The ability to control three parallel lines with minimum propagation delay from a single point makes the MC10212 particularly useful in clock distribution applications where minimum clock skew is desired.

 $P_D = 160$ mW typ/pkg (No Load) $t_{pd} = 1.5$ ns typ (All Outputs Loaded) t_r , $t_f = 1.5$ ns typ (20%–80%)

DIP PIN ASSIGNMENT

Pin assignment is for Dual–in–Line Package. For PLCC pin assignment, see the Pin Conversion Tables on page 6–11 of the Motorola MECL Data Book (DL122/D).

^{*} Individually test each input using the pin connections shown.

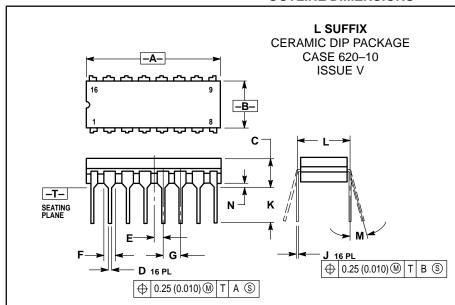

Each MECL 10,000 series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50–ohm resistor to –2.0 volts. Test procedures are shown for only one gate. The other gates are tested in the same manner.
