

IH5040-IH5051 Family **High Level CMOS** **Analog Gates**

FEATURES

- Switches Greater Than 20Vpp Signals With $\pm 15V$ Supplies
- Quiescent Current Less Than $1\mu A$
- Overvoltage Protection to $\pm 25V$
- Break-Before-Make Switching t_{off} 200 nsec, t_{on} 300 nsec Typical
- T^2L , DTL, CMOS, PMOS Compatible
- Non-Latching With Supply Turn-Off
- Low $r_{DS(on)} - 35\Omega$
- New DPDT & 4PST Configurations
- Complete Monolithic Construction
IH5040 through IH5047

FUNCTIONAL DIAGRAM

FIGURE 1. TYPICAL DRIVER, GATE - IH5042

ORDERING INFORMATION

GENERAL DESCRIPTION

The IH5040 family of solid state analog gates are designed using an improved, high voltage CMOS monolithic technology. These devices provide ease-of-use and performance advantages not previously available from solid state switches. This improved CMOS technology provides input overvoltage capability to ± 25 volts without damage to the device, and destructive latch-up of solid state analog gates has been eliminated. Early CMOS gates were destroyed when power supplies were removed with an input signal present. The IH5040 CMOS technology has eliminated this serious systems problem.

Key performance advantages of the 5040 series are TTL compatibility and ultra low-power operation. The quiescent current requirement is less than $1\mu A$. Also designed into the 5040 is guaranteed Break-Before-Make switching, which is accomplished by extending the t_{on} time (300 nsec TYP.) so that it exceeds t_{off} time (200 nsec TYP.). This insures that an ON channel will be turned OFF before an OFF channel can turn ON. This eliminates the need for external logic required to avoid channel to channel shorting during switching.

Many of the 5040 series improve upon and are pin-for-pin and electrical replacements for other solid state switches.

FUNCTIONAL DESCRIPTION

INTERSIL PART NO.	TYPE	$r_{DS(on)}$	PIN/FUNCTIONAL EQUIVALENT (Note 1)
IH5040	SPST	75Ω	
IH5041	Dual SPST	75Ω	
IH5042	SPDT	75Ω	DG 188AA/BA
IH5043	Dual SPDT	75Ω	DG 191AP/BP
IH5044	DPST	75Ω	
IH5045	Dual DPST	75Ω	DG 185AP/BP
IH5046	DPDT	75Ω	
IH5047	4PST	75Ω	
IH5048 Dual	SPST	35Ω	
IH5049 Dual	DPST	35Ω	DG 184AP/BP
IH5050	SPDT	35Ω	DG 187AA/BA
IH5051 Dual	SPDT	35Ω	DG 190AP/BP

NOTE 1. See Switching State diagrams for applicable package equivalency.

Pin and functional equivalent monolithic versions of the DG181, DG182, DG187 and DG188 are available. See data sheet for this and also IH181 to IH191.

ABSOLUTE MAXIMUM RATINGS

Current (Any Terminal) < 30mA
 Storage Temperature -65°C to +150°C
 Operating Temperature -55°C to +125°C
 Power Dissipation 450mW

(All Leads Soldered to a P.C. Board)

Derate 6mW/°C Above 70°C

Lead Temperature (Soldering, 10 sec) 300°C

$V^+ - V^-$ < 33V

$V^+ - V_D$ < 30V

$V_D - V^-$ < 30V

$V_D - V_S$ < ±22V

$V_L - V^-$ < 33V

$V_L - V_{IN}$ < 30V

$V_L - GND$ < 20V

$V_{IN} - GND$ < 20V

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS (@ 25°C, $V^+ = +15$ V, $V^- = -15$ V, $V_L = +5$ V)

PER CHANNEL		MIN./MAX. LIMITS

LOGIC INTERFACING

THEORY OF OPERATION

A. FLOATING BODY CMOS STRUCTURE

In a conventional C-MOS structure, the body of the "n" channel device is tied to the negative supply, thus forming a reverse biased diode between the drain/source and the body (Fig. J). Under certain conditions this diode can become forward biased; for example, if the supplies are off (at ground) and a negative input is applied to the drain. This can have serious consequences for two reasons. Firstly, the diode has no current limiting and if excessive current flows, the circuit may be permanently damaged. Secondly, this diode forms part of a parasitic SCR in the conventional C-MOS structure. Forward biasing the diode causes the SCR to turn on, giving rise to a "latch-up" condition.

Intersil's improved C-MOS process incorporates an additional diode in series with the body (Fig. K). The cathode of this diode is then tied to V^+ , thus effectively floating the body. The inclusion of this diode not only blocks the excessive current path, but also prevents the SCR from turning on.

B. OVERVOLTAGE PROTECTION

The floating body construction inherently provides over-voltage protection. In the conventional C-MOS process, the body of all N-channel FETs is tied to the most negative power supply and the body of all P-channel devices to the most positive supply (i. e., $\pm 15V$). Thus, for an overvoltage spike of $> \pm 15V$, a forward bias condition exists between drain and body of the MOSFET. For example, in Fig. J if the analog signal input is more negative than $-15V$, the drain to body of the N-channel FET is forward biased and destruction of the device can result. Now by floating the body, using diode D_1 , the drain to body of the MOSFET is still forward biased, but D_1 is reversed biased so no current flows (up to the breakdown of D_1 which is $\geq 40V$). Thus, negative excursions of the analog signal can go up to a maximum of $-25V$. When the signal goes positive ($\geq +15V$, D_1 is forward biased, but now the drain to body junction is reversed for the N-channel FET; this allows the signal to go to a maximum of $+25V$ with no appreciable current flow. While the explanation above has been restricted to N-channel devices, the same applies to P-channel FETs and the construction is as shown in Fig. L. Fig. L describes an output stage showing the paralleling of an N and P channel to linearize the $r_{DS(ON)}$ with signal input. The presence of diodes D_1 and D_2 effectively floats the bodies and provides over voltage protection to a maximum of $\pm 25V$.
