

LMV761/LMV762

Low Voltage, Precision Comparator with Push-Pull Output

General Description

The LMV761/762 are precision comparators intended for applications requiring low noise and low input offset voltage. The LMV761 single has a shutdown pin that can be used to disable the device and reduce the supply current. The LMV761 is available in a space saving SOT23-6 or SOIC-8 package. The LMV762 dual is available in SOIC-8 or MSOP-8 package.

They feature a CMOS input and Push-Pull output stage. The Push-Pull output stage eliminates the need for an external pull-up resistor.

The LMV761/762 are designed to meet the demands of small size, low power and high performance required by portable and battery operated electronics.

The input offset voltage has a typical value of 200 μ V at room temp and a 1mV limit over temp.

Features

($V_S = 5V$, $T_A = 25^\circ C$, Typical values unless specified)

- Input offset voltage 0.2mV
- Input offset voltage (max over temp) 1mV
- Input bias current 0.2pA
- Propagation delay (OD = 50mV) 120 nsec
- Low supply current 300 μ A
- CMRR 100dB
- PSRR 110dB
- Extended Temperature Range $-40^\circ C$ to $125^\circ C$
- Push-pull output
- Ideal for 2.7V and 5V single supply applications
- Available in space-saving packages:
 - 6-Pin SOT23 (single w/shutdown)
 - 8-Pin SOIC (single w/shutdown)
 - 8-Pin SOIC/MSOP (dual without shutdown)

Applications

- Portable and battery-powered systems
- Scanners
- Set top boxes
- High speed differential line receiver
- Window comparators
- Zero-crossing detectors
- High speed sampling circuits

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not guaranteed. For guaranteed specifications and the test condition, see the Electrical Characteristics.

Note 2: Unless otherwise specified human body model is 1.5k Ω in series with 100pF. Machine model 200pF.

Note 3: Electrical Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that $T_J = T_A$. No guarantee of parametric performance is indicated in the electrical tables under conditions of internal self-heating where $T_J > T_A$. See Application section for information on temperature de-rating of this device. Absolute Maximum Rating indicate junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.

Note 4: The maximum power dissipation is a function of $T_{J(MAX)}$, θ_{JA} , and T_A . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A) \theta_{JA}$. All numbers apply for packages soldered directly into a PC board.

Note 5: Maximum temperature guarantee range is -40°C to 125°C .

Note 6: Typical values represent the most likely parametric norm.

Note 7: All limits are guaranteed by testing or statistical analysis.

Note 8: Guaranteed by design

Application Hints

Basic Comparator

A basic comparator circuit is used to convert analog input signals to digital output signals. The comparator compares an input voltage (V_{IN}) at the non-inverting input to the reference voltage (V_{REF}) at the inverting pin. If V_{IN} is less than V_{REF} the output (V_O) is low (V_{OL}). However, if V_{IN} is greater than V_{REF} , the output voltage (V_O) is high (V_{OH}).

FIGURE 1. Basic Comparator

Hysteresis

The basic comparator configuration may oscillate or produce a noisy output if the applied differential input is near the comparator's input offset voltage. This tends to occur when the voltage on one input is equal or very close to the other input voltage. Adding hysteresis can prevent this problem. Hysteresis creates two switching thresholds (one for the rising input voltage and the other for the falling input voltage). Hysteresis is the voltage difference between the two switching thresholds. When both inputs are nearly equal, hysteresis causes one input to effectively move quickly past the other. Thus, moving the input out of the region in which oscillation may occur.

Hysteresis can easily be added to a comparator in a non-inverting configuration with two resistors and positive feedback *Figure 2*. The output will switch from low to high when V_{IN} rises up to V_{IN1} , where V_{IN1} is calculated by

$$V_{IN1} = (V_{REF}(R_1 + R_2))/R_2$$

The output will switch from high to low when V_{IN} falls to V_{IN2} , where V_{IN2} is calculated by

$$V_{IN2} = (V_{REF}(R_1 + R_2) - V_{CC} R_1)/R_2$$

The Hysteresis is the difference between V_{IN1} and V_{IN2} .

$$\begin{aligned} \Delta V_{IN} &= V_{IN1} - V_{IN2} \\ &= ((V_{REF}(R_1 + R_2))/R_2) - ((V_{REF}(R_1 + R_2) - V_{CC} R_1)/R_2) \\ &= V_{CC} R_1/R_2 \end{aligned}$$

FIGURE 2. Non-Inverting Comparator Configuration

Input

The LMV761/762 have near zero input bias current. This allows very high resistance circuits to be used without any concern for matching input resistances. This also allows the use of very small capacitors in R-C type timing circuits. This reduces the cost of the capacitors and amount of board space used.

Shutdown Mode

The LMV761 features a low-power shutdown pin that is activated by driving $\overline{SD}$ low. In shutdown mode, the output is in a high impedance state, supply current is reduced to 20nA and the comparator is disabled. Driving $\overline{SD}$ high will turn the comparator on. The $\overline{SD}$ pin should not be left unconnected due to the fact that it is a high impedance input. When left unconnected, the output will be at an unknown voltage. Also do not three-state the $\overline{SD}$ pin.

The maximum input voltage for $\overline{SD}$ is 5.5V, referred to ground and is not limited by V_{CC} . This allows the use of 5V logic to drive $\overline{SD}$ while V_{CC} operates at a lower voltage, such as 3V. The logic threshold limits for $\overline{SD}$ are proportional to V_{CC} .

Board Layout and Bypassing

The LMV761/762 is designed to be stable and oscillation free, but it is still important to include the proper bypass capacitors and ground pickups. Ceramic 0.1μF capacitors should be placed at both supplies to provide clean switching. Minimize the length of signal traces to reduce stray capacitance.
