LMV981-N Single / LMV982 Dual 1.8V, RRIO Operational Amplifiers with Shutdown

Check for Samples: LMV981-N, LMV982-N

FEATURES

- **(Typical 1.8V Supply Values; Unless Otherwise Noted)**
- **Ensured 1.8V, 2.7V and 5V Specifications**
- **Output Swing**
  - **w/600Ω load 80mV from Rail**
  - **w/2kΩ load 30mV from Rail**
- **V_{CM} 200mV Beyond Rails**
- **Supply Current (Per Channel) 100µA**
- **Gain Bandwidth Product 1.4MHz**
- **Maximum V_{OS} 4.0mV**
- **Gain w/600Ω Load 101dB**
- **Ultra Tiny Package DSBGA 1.0mm x 1.5mm**
- **Turn-On Time from Shutdown 19µs**
- **Temperature Range −40°C to 125°C**

APPLICATIONS

- **Industrial and Automotive**
- **Consumer Communication**
- **Consumer Computing**
- **PDAs**
- **Portable audio**
- **Portable/Battery-Powered Electronic Equipment**
- **Supply Current Monitoring**
- **Battery Monitoring**

DESCRIPTION

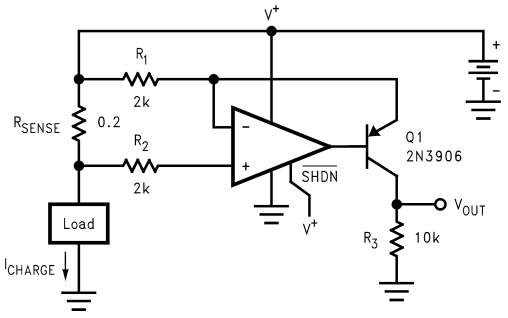
LMV981-N/LMV982 are low voltage, low power operational amplifiers. LMV981-N/LMV982 operate from +1.8V to +5.0V supply voltages and have rail-to-rail input and output. LMV981-N/LMV982 input common mode voltage extends 200mV beyond the supplies which enables user enhanced functionality beyond the supply voltage range. The output can swing rail-to-rail unloaded and within 105mV from the rail with 600Ω load at 1.8V supply. LMV981-N/LMV982 are optimized to work at 1.8V which make them ideal for portable two-cell battery powered systems and single cell Li-Ion systems.

LMV981-N/LMV982 offer a shutdown pin that can be used to disable the device and reduce the supply current. The device is in shutdown when the SHDN-pin = low. The output will be high impedance in shutdown.

LMV981-N/LMV982 exhibit excellent speed-power ratio, achieving 1.4MHz gain bandwidth product at 1.8V supply voltage with very low supply current. LMV981-N/LMV982 are capable of driving a 600Ω load and up to 1000pF capacitive load with minimal ringing. LMV981-N/LMV982 have a high DC gain of 101dB, making them suitable for low frequency applications.

LMV981-N is offered in space saving 6-Bump DSBGA, SC70-6 and SOT-23-6 packages. The 6-Bump DSBGA package has only a 1.006mm x 1.514mm x 0.945mm footprint. LMV982 is offered in space saving VSSOP-10 package. These small packages are ideal solutions for area constrained PC boards and portable electronics such as cellular phones and PDAs.

Typical Application



$$V_{OUT} = \frac{R_{SENSE} \bullet R_3}{R_1} \bullet I_{Charge} = 1\Omega \bullet I_{Charge}$$

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings (1)(2)

ESD Tolerance (3)	
Machine Model	200V
Human Body Model	2000V
Supply Voltage (V^+–V^-)	5.5V
Differential Input Voltage	± Supply Voltage
Voltage at Input/Output Pins	V^++0.3V, V^--0.3V
Storage Temperature Range	−65°C to 150°C
Junction Temperature (4)	150°C
For soldering specifications:	
http://www.ti.com/lit/SNOA549f	

(1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical Characteristics.
(2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
(3) Human Body Model, applicable std. MIL-STD-883, Method 3015.7. Machine Model, applicable std. JESD22-A115-A (ESD MM std. of JEDEC) Field-Induced Charge-Device Model, applicable std. JESD22-C101-C (ESD FICDM std. of JEDEC).
(4) The maximum power dissipation is a function of $T_{J(MAX)}$, θ_{JA}, and T_A. The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)}–T_A)/\theta_{JA}$. All numbers apply for packages soldered directly into a PC board.

Operating Ratings (1)

Supply Voltage Range	1.8V to 5.0V
Temperature Range	−40°C to 125°C
Thermal Resistance (θ_{JA})	
6-Bump DSBGA	286°C/W
SC70-6	414°C/W
SOT-23-6	265°C/W
VSSOP-10	235°C/W

(1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical Characteristics.

1.8V DC Electrical Characteristics

Unless otherwise specified, all limits ensured for T_J = 25°C. V^+ = 1.8V, V^- = 0V, $V_{CM} = V^+/2$, $V_O = V^+/2$, R_L > 1 MΩ and $\overline{SHDN}$ tied to V^+. **Boldface** limits apply at the temperature extremes. See (1).

Parameter		Test Conditions	Min (2)	Typ (3)	Max (2)	Units
V_{OS}	Input Offset Voltage	LMV981-N (Single)		1	4 **6**	mV
		LMV982 (Dual)		1	5.5 **7.5**	
TCV_{OS}	Input Offset Voltage Average Drift			5.5		µV/°C
I_B	Input Bias Current			15	35 **50**	nA

(1) Electrical Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that $T_J = T_A$. No ensured specification of parametric performance is indicated in the electrical tables under conditions of internal self heating where $T_J > T_A$. See Application Note section for information on temperature derating of this device. Absolute Maximum Ratings indicated junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.
(2) All limits are specified by testing or statistical analysis.
(3) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not ensured on shipped production material.

1.8V DC Electrical Characteristics (continued)

Unless otherwise specified, all limits ensured for T_J = 25°C. V^+ = 1.8V, V^- = 0V, V_{CM} = V^+/2, V_O = V^+/2, R_L > 1 MΩ and $\overline{SHDN}$ tied to V^+. **Boldface** limits apply at the temperature extremes. See (1).

Parameter		Test Conditions		Min (2)	Typ (3)	Max (2)	Units
I_{OS}	Input Offset Current				13	25 **40**	nA
I_S	Supply Current (per channel)				103	185 **205**	µA
		In Shutdown	LMV981-N (Single)		0.156	1 **2**	
			LMV982 (Dual)		0.178	3.5 **5**	
CMRR	Common Mode Rejection Ratio	LMV981-N, 0 ≤ V_{CM} ≤ 0.6V 1.4V ≤ V_{CM} ≤ 1.8V (4)		60 **55**	78		dB
		LMV982, 0 ≤ V_{CM} ≤ 0.6V 1.4V ≤ V_{CM} ≤ 1.8V (4)		55 **50**	76		
		−0.2V ≤ V_{CM} ≤ 0V 1.8V ≤ V_{CM} ≤ 2.0V		50	72		
PSRR	Power Supply Rejection Ratio	1.8V ≤ V^+ ≤ 5V		75 **70**	100		dB
CMVR	Input Common-Mode Voltage Range	For CMRR Range ≥ 50dB	T_A = 25°C	V^- −0.2	−0.2 to 2.1	V^+ +0.2	V
			T_A = −40°C to 85°C	V^-		V^+	
			T_A = 125°C	V^- +0.2		V^+ −0.2	
A_V	Large Signal Voltage Gain LMV981-N (Single)	R_L = 600Ω to 0.9V, V_O = 0.2V to 1.6V, V_{CM} = 0.5V		77 **73**	101		dB
		R_L = 2kΩ to 0.9V, V_O = 0.2V to 1.6V, V_{CM} = 0.5V		80 **75**	105		
	Large Signal Voltage Gain LMV982 (Dual)	R_L = 600Ω to 0.9V, V_O = 0.2V to 1.6V, V_{CM} = 0.5V		75 **72**	90		dB
		R_L = 2kΩ to 0.9V, V_O = 0.2V to 1.6V, V_{CM} = 0.5V		78 **75**	100		
V_O	Output Swing	R_L = 600Ω to 0.9V V_{IN} = ± 100mV		1.65 **1.63**	1.72		V
					0.077	0.105 **0.120**	
		R_L = 2kΩ to 0.9V V_{IN} = ± 100mV		1.75 **1.74**	1.77		
					0.024	0.035 **0.04**	
I_O	Output Short Circuit Current (5)	Sourcing, V_O = 0V V_{IN} = 100mV		4 **3.3**	8		mA
		Sinking, V_O = 1.8V V_{IN} = −100mV		7 **5**	9		
Ton	Turn-on Time from Shutdown				19		µs
V_{SHDN}	Turn-on Voltage to enable part				1.0		V
	Turn-off Voltage				0.55		

(4) For ensured temperature ranges, see Input Common-Mode Voltage Range specifications.
(5) Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C. Output currents in excess of 45mA over long term may adversely affect reliability.

1.8V AC Electrical Characteristics

Unless otherwise specified, all limits ensured for T_J = 25°C. V^+ = 1.8V, V^- = 0V, $V_{CM} = V^+/2$, $V_O = V^+/2$, R_L > 1 MΩ and $\overline{SHDN}$ tied to V^+. **Boldface** limits apply at the temperature extremes. See (1).

Parameter		Test Conditions	Min (2)	Typ (3)	Max (2)	Units

APPLICATION NOTE

Input and Output Stage

The rail-to-rail input stage of this family provides more flexibility for the designer. The LMV981-N/LMV982 use a complimentary PNP and NPN input stage in which the PNP stage senses common mode voltage near V^- and the NPN stage senses common mode voltage near V^+. The transition from the PNP stage to NPN stage occurs 1V below V^+. Since both input stages have their own offset voltage, the offset of the amplifier becomes a function of the input common mode voltage and has a crossover point at 1V below V^+.

This V_{OS} crossover point can create problems for both DC and AC coupled signals if proper care is not taken. Large input signals that include the V_{OS} crossover point will cause distortion in the output signal. One way to avoid such distortion is to keep the signal away from the crossover. For example, in a unity gain buffer configuration and with V_S = 5V, a 5V peak-to-peak signal will contain input-crossover distortion while a 3V peak-to-peak signal centered at 1.5V will not contain input-crossover distortion as it avoids the crossover point. Another way to avoid large signal distortion is to use a gain of −1 circuit which avoids any voltage excursions at the input terminals of the amplifier. In that circuit, the common mode DC voltage can be set at a level away from the V_{OS} cross-over point. For small signals, this transition in V_{OS} shows up as a V_{CM} dependent spurious signal in series with the input signal and can effectively degrade small signal parameters such as gain and common mode rejection ratio. To resolve this problem, the small signal should be placed such that it avoids the V_{OS} crossover point. In addition to the rail-to-rail performance, the output stage can provide enough output current to drive 600Ω loads. Because of the high current capability, care should be taken not to exceed the 150°C maximum junction temperature specification.

Shutdown Mode

The LMV981-N/LMV982 have a shutdown pin. To conserve battery life in portable applications, the LMV981-N/LMV982 can be disabled when the shutdown pin voltage is pulled low.

The shutdown pin can't be left unconnected. In case shut-down operation is not needed, the shutdown pin should be connected to V^+ when the LMV981-N/LMV982 are used. Leaving the shutdown pin floating will result in an undefined operation mode, either shutdown or active, or even oscillating between the two modes.

Input Bias Current Consideration

The LMV981-N/LMV982 family has a complementary bipolar input stage. The typical input bias current (I_B) is 15nA. The input bias current can develop a significant offset voltage. This offset is primarily due to I_B flowing through the negative feedback resistor, R_F. For example, if I_B is 50nA and R_F is 100kΩ, then an offset voltage of 5mV will develop ($V_{OS} = I_B \times R_F$). Using a compensation resistor (R_C), as shown in Figure 31, cancels this effect. But the input offset current (I_{OS}) will still contribute to an offset voltage in the same manner.

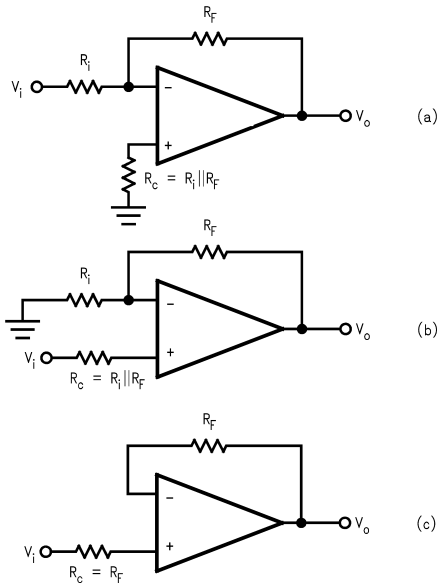

Figure 31. Canceling the Offset Voltage due to Input Bias Current

Typical Applications

High Side Current Sensing

The high side current sensing circuit (Figure 32) is commonly used in a battery charger to monitor charging current to prevent over charging. A sense resistor R_{SENSE} is connected to the battery directly. This system requires an op amp with rail-to-rail input. The LMV981-N/LMV982 are ideal for this application because the common mode input range goes up to the rail.

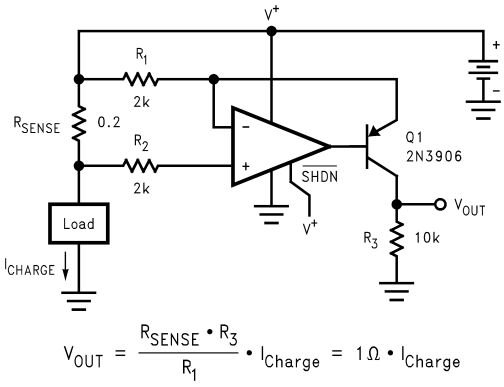

Figure 32. High Side Current Sensing

Half-Wave Rectifier with Rail-to-Ground Output Swing

Since the LMV981-N/LMV982 input common mode range includes both positive and negative supply rails and the output can also swing to either supply, achieving half-wave rectifier functions in either direction is an easy task. All that is needed are two external resistors; there is no need for diodes or matched resistors. The half wave rectifier can have either positive or negative going outputs, depending on the way the circuit is arranged.

In Figure 33 the circuit is referenced to ground, while in Figure 34 the circuit is biased to the positive supply. These configurations implement the half wave rectifier since the LMV981-N/LMV982 can not respond to one-half of the incoming waveform. It can not respond to one-half of the incoming because the amplifier can not swing the output beyond either rail therefore the output disengages during this half cycle. During the other half cycle, however, the amplifier achieves a half wave that can have a peak equal to the total supply voltage. R_I should be large enough not to load the LMV981-N/LMV982.

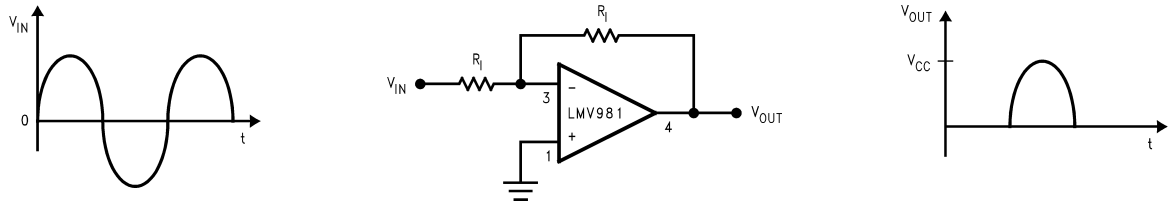

Figure 33. Half-Wave Rectifier with Rail-to-Ground Output Swing Referenced to Ground

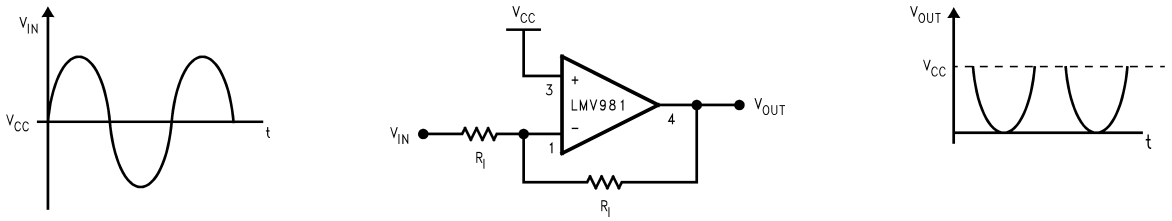

Figure 34. Half-Wave Rectifier with Negative-Going Output Swing Referenced to V_{CC}

Instrumentation Amplifier with Rail-to-Rail Input and Output

Some manufactures make a non-“rail-to-rail”-op amp rail-to-rail by using a resistive divider on the inputs. The resistors divide the input voltage to get a rail-to-rail input range. The problem with this method is that it also divides the signal, so in order to get the obtained gain, the amplifier must have a higher closed loop gain. This raises the noise and drift by the internal gain factor and lowers the input impedance. Any mismatch in these precision resistors reduces the CMRR as well. The LMV981-N/LMV982 is rail-to-rail and therefore doesn't have these disadvantages.

Using three of the LMV981-N/LMV982 amplifiers, an instrumentation amplifier with rail-to-rail inputs and outputs can be made as shown in Figure 35.

In this example, amplifiers on the left side act as buffers to the differential stage. These buffers assure that the input impedance is very high and require no precision matched resistors in the input stage. They also assure that the difference amp is driven from a voltage source. This is necessary to maintain the CMRR set by the matching R_1-R_2 with R_3-R_4. The gain is set by the ratio of R_2/R_1 and R_3 should equal R_1 and R_4 equal R_2. With both rail-to-rail input and output ranges, the input and output are only limited by the supply voltages. Remember that even with rail-to-rail outputs, the output can not swing past the supplies so the combined common mode voltages plus the signal should not be greater that the supplies or limiting will occur. For additional applications, see Texas Instruments application notes AN–29, AN–31, AN–71, and AN–127.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
