

FEATURES

- Low $R_{DS(on)}$ of 12 m Ω
- Low input voltage range: 1.8 V to 5.5 V
- Quick output discharge (QOD) circuit ([ADP197-02](#))
- 3 A continuous operating current at 70°C
- 1.2 V logic-compatible enable input
- Low 18 μ A quiescent current, $V_{IN} < 3$ V
- Low 31 μ A quiescent current, $V_{IN} = 4.2$ V
- Overtemperature protection
- Ultralow shutdown current: <1 μ A
- Ultrasmall 1.0 mm $\times$ 1.5 mm, 0.5 mm pitch, 6-ball WLCSP
- Tiny 2.0 mm $\times$ 2.0 mm $\times$ 0.55 mm, 0.65 mm pitch, 6-lead LFCSP

APPLICATIONS

- Mobile phones
- Digital cameras and audio devices
- Portable and battery-powered equipment

GENERAL DESCRIPTION

The [ADP197](#) is a high-side load switch designed for operation between 1.8 V and 5.5 V. This load switch provides power domain isolation, which helps extend battery operation. The device contains a low on-resistance, N-channel MOSFET that supports more than 3 A of continuous current and minimizes power loss. The low 18 μ A quiescent current and ultralow shutdown current make the [ADP197](#) ideal for battery-operated portable equipment. The built-in level shifter for enable logic makes the [ADP197](#) compatible with many processors and GPIO controllers.

Overtemperature protection circuitry activates if the junction temperature exceeds 125°C, thereby protecting itself and downstream circuits from potential damage.

TYPICAL APPLICATIONS CIRCUIT

Figure 1.

The [ADP197-02](#) incorporates an internal quick output discharge (QOD) circuit to discharge the output capacitance when the [ADP197-02](#) output is disabled

In addition to operating performance, the [ADP197](#) WLCSP package occupies minimal printed circuit board (PCB) space with an area of less than 1.5 mm² and a height of 0.60 mm.

The [ADP197](#) is available in an ultrasmall 1.0 mm $\times$ 1.5 mm, 0.5 mm pitch, 6-ball WLCSP and a 2.0 mm $\times$ 2.0 mm $\times$ 0.55 mm, 0.65 mm pitch, 6-lead LFCSP.

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
VIN to GND	−0.3 V to +6.5 V
VOU to GND	−0.3 V to VIN
EN to GND	−0.3 V to +6.5 V
Continuous Drain Current	
TA = 25°C	±4 A
TA = 85°C	±2.22 A
Continuous Diode Current	−50 mA
Storage Temperature Range	−65°C to +150°C
Operating Junction Temperature Range	−40°C to +105°C
Soldering Conditions	JEDEC J-STD-020

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 3. Typical θ_{JA} and Ψ_{JB} Values

Package Type	θ_{JA}	Ψ_{JB}	Unit
6-Ball, 0.5 mm Pitch WLCSP	260	58	°C/W
6-Lead, 0.65 mm Pitch LFCSP	68.9	44.1	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

THEORY OF OPERATION

Figure 25. Functional Block Diagram

The **ADP197** is a high-side NMOS load switch, controlled by an internal charge pump. The **ADP197** is designed to operate with power supply voltages between 1.8 V and 5.5 V.

An internal charge pump biases the NMOS switch to achieve a relatively constant, ultralow on resistance of 12 mΩ across the entire input voltage range. The use of the internal charge pump also allows for controlled turn-on times. Turning the NMOS switch on and off is controlled by the enable input pin (EN), which is capable of interfacing directly with 1.8 V logic signals.

The **ADP197** is capable of 3 A of continuous operating current as long as T_J is less than 70°C. At 85°C, the rated current drops to 2.22 A.

The overtemperature protection circuit activates if the load current causes the junction temperature to exceed 125°C. When this occurs, the overtemperature protection circuitry disables the output until the junction temperature falls below approximately 110°C, at which point the output is reenabled. If the fault condition persists, the output cycles off and on until the fault is removed.

The **ADP197-02** incorporates a QOD circuit to discharge the output capacitance when the **ADP197-02** output is disabled.

ESD protection structures are shown in the block diagram as Zener diodes.

The **ADP197** is a low quiescent current device with a nominal 4 MΩ pull-down resistor on its EN pin. The package is a space-saving 1.0 mm × 1.5 mm, 0.5 mm pitch, 6-ball WLCSP and a tiny 2.0 mm × 2.0 mm × 0.55 mm, 0.65 mm pitch, 6-lead LFCSP.

APPLICATIONS INFORMATION

CAPACITOR SELECTION

Output Capacitor

The ADP197 is designed for operation with small, space-saving ceramic capacitors but functions with most commonly used capacitors when the effective series resistance (ESR) value is carefully considered. The ESR of the output capacitor affects the response to load transients. A typical 1 μF capacitor with an ESR of 0.1 Ω or less is recommended for good transient response. Using a larger value of output capacitance improves the transient response to large changes in load current.

Input Bypass Capacitor

Connecting at least 1 μF of capacitance from V_{IN} to GND reduces the circuit sensitivity to the printed circuit board (PCB) layout, especially when high source impedance or long input traces are encountered. When greater than 1 μF of output capacitance is required, increase the input capacitor to match it.

GROUND CURRENT

The major source for ground current in the ADP197 is the internal charge pump for the FET drive circuitry. Figure 26 shows the typical ground current when $V_{\text{EN}} = V_{\text{IN}}$, and varies from 1.8 V to 5.5 V.

Figure 26. Ground Current vs. Input Voltage (V_{IN}), Different Load Currents

ENABLE FEATURE

The ADP197 uses the EN pin to enable and disable the V_{OUT} pin under normal operating conditions. As shown in Figure 27, when a rising voltage (V_{EN}) on the EN pin crosses the active threshold, V_{OUT} turns on. When a falling voltage (V_{EN}) on the EN pin crosses the inactive threshold, V_{OUT} turns off.

Figure 27. Typical EN Operation

As shown in Figure 27, the EN pin has hysteresis built into it. This built-in hysteresis prevents on/off oscillations that can occur due to noise on the EN pin as it passes through the threshold points.

The EN pin active and inactive thresholds derive from the V_{IN} voltage; therefore, these thresholds vary with the changing input voltage. Figure 28 shows the typical EN active and inactive thresholds when the input voltage varies from 1.8 V to 5.5 V.

Figure 28. Typical EN Threshold vs. Input Voltage (V_{IN})

TIMING

Turn-on delay is defined as the interval between the time that V_{EN} exceeds the rising threshold voltage and when V_{OUT} rises to $\sim 10\%$ of its final value. The ADP197 includes circuitry that has a typical 1 ms turn-on delay and a controlled rise time to limit the V_{IN} inrush current. As shown in Figure 29 and Figure 30, the turn-on delay is nearly independent of the input voltage.

Figure 29. Typical Turn-On Delay Time with $V_{IN} = 1.9\text{ V}$, $I_{LOAD} = 200\text{ mA}$

Figure 30. Typical Turn-On Delay Time with $V_{IN} = 5.5\text{ V}$, $I_{LOAD} = 220\text{ mA}$

The rise time is defined as the time it takes the output voltage to rise from 10% to 90% of V_{OUT} reaching its final value. It is dependent on the rise time of the internal charge pump.

For very large values of output capacitance, the RC time constant (where C is the load capacitance (C_{LOAD}) and R is the $R_{DS(on)} || R_{LOAD}$) can become a factor in the rise time of the output voltage. Because $R_{DS(on)}$ is much smaller than R_{LOAD} , an adequate approximation for RC is $R_{DS(on)} \times C_{LOAD}$. An input or load capacitor is not required for the ADP197 although capacitors can be used to suppress noise on the board. Figure 31 and Figure 32 show the inrush current when C_{LOAD} is 100 μF .

Figure 31. Typical Rise Time and Inrush Current, $C_{LOAD} = 100\text{ }\mu\text{F}$, $V_{IN} = 1.9\text{ V}$, $I_{LOAD} = 270\text{ mA}$

Figure 32. Typical Rise Time and Inrush Current, $C_{LOAD} = 100\text{ }\mu\text{F}$, $V_{IN} = 5.5\text{ V}$, $I_{LOAD} = 350\text{ mA}$

The turn-off time is defined as the time it takes for the output voltage to fall from 90% to 10% of V_{OUT} reaching its final value. It is also dependent on the RC time constant of the output capacitance and load resistance. Figure 33 shows the typical turn-off time with $V_{IN} = 3.6\text{ V}$, $C_{OUT} = 1\text{ }\mu\text{F}$, and $R_{LOAD} = 18\text{ }\Omega$.
