

Features

- Fast Read Access Time - 150 ns
- Fast Byte Write - 200 μ s or 1 ms
- Self-Timed Byte Write Cycle
 - Internal Address and Data Latches
 - Internal Control Timer
 - Automatic Clear Before Write
- Direct Microprocessor Control
 - DATA POLLING
 - READY/BUSY Open Drain Output
- Low Power
 - 30 mA Active Current
 - 100 μ A CMOS Standby Current
- High Reliability
 - Endurance: 10^4 or 10^5 cycles
 - Data Retention: 10 years
- 5 V $\pm$ 10% Supply
- CMOS & TTL Compatible Inputs and Outputs
- JEDEC Approved Byte Wide Pinout
- Full Military, Commercial, and Industrial Temperature Ranges

16K (2K x 8)
CMOS
E²PROM

Description

The AT28C17 is a low-power, high-performance Electrically Erasable and Programmable Read Only Memory with easy to use features. The AT28C17 is a 16K memory organized as 2,048 words x 8 bits. The device is manufactured with Atmel's reliable nonvolatile CMOS technology.

The AT28C17 is accessed like a static RAM for the read or write cycles without the need of external components. During a byte write, the address and data are latched internally, freeing the microprocessor address and data bus for other operations. Following the initiation of a write cycle, the device will go to a busy state and automatically clear and write the latched data using an internal control timer. The device includes two methods for detecting the end of a write cycle, level detection of RDY/BUSY and DATA polling of I/O7. Once the end of a write cycle has been detected, a new access for a read or a write can begin.

The CMOS technology offers fast access times of 150 ns at low power dissipation. When the chip is deselected the standby current is less than 100 μ A.

Atmel's 28C17 has additional features to ensure high quality and manufacturability. The device utilizes error correction internally for extended endurance and for improved data retention characteristics. An extra 32 bytes of E²PROM are available for device identification or tracking.

Pin Configurations

Pin Name	Function
A0 - A10	Addresses
CE	Chip Enable
OE	Output Enable
WE	Write Enable
I/O0 - I/O7	Data Inputs/Outputs
RDY/BUSY	Ready/Busy Output
NC	No Connect

CERDIP, PDIP, SOIC

* = RDY/BUSY

Note: PLCC package pins 1 and 17 are DON'T CONNECT.

Block Diagram

Absolute Maximum Ratings*

Temperature Under Bias.....	-55°C to +125°C
Storage Temperature.....	-65°C to +150°C
All Input Voltages (including N.C. Pins) with Respect to Ground	-0.6 V to +6.25 V
All Output Voltages with Respect to Ground	-0.6 V to V _{CC} + 0.6 V
Voltage on OE and A9 with Respect to Ground	-0.6 V to +13.5 V

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Device Operation

READ: The AT28C17 is accessed like a Static RAM. When CE and OE are low and WE is high, the data stored at the memory location determined by the address pins is asserted on the outputs. The outputs are put in a high impedance state whenever CE or OE is high. This dual line control gives designers increased flexibility in preventing bus contention.

BYTE WRITE: Writing data into the AT28C17 is similar to writing into a Static RAM. A low pulse on the WE or CE input with OE high and CE or WE low (respectively) initiates a byte write. The address location is latched on the last falling edge of WE (or CE); the new data is latched on the first rising edge. Internally, the device performs a self-clear before write. Once a byte write has been started, it will automatically time itself to completion. Once a programming operation has been initiated and for the duration of twc, a read operation will effectively be a polling operation.

FAST BYTE WRITE: The AT28C17E offers a byte write time of 200 µs maximum. This feature allows the entire device to be rewritten in 0.4 seconds.

READY/BUSY: Pin 1 is an open drain READY/BUSY output that can be used to detect the end of a write cycle. RDY/BUSY is actively pulled low during the write cycle and is released at the completion of the write. The open drain connection

allows for OR-tying of several devices to the same RDY/BUSY line.

DATA POLLING: The AT28C17 provides DATA POLLING to signal the completion of a write cycle. During a write cycle, an attempted read of the data being written results in the complement of that data for I/O7 (the other outputs are indeterminate). When the write cycle is finished, true data appears on all outputs.

WRITE PROTECTION: Inadvertent writes to the device are protected against in the following ways. (a) V_{CC} sense— if V_{CC} is below 3.8 V (typical) the write function is inhibited. (b) V_{CC} power on delay— once V_{CC} has reached 3.8 V the device will automatically time out 5 ms (typical) before allowing a byte write. (c) Write Inhibit— holding any one of OE low, CE high or WE high inhibits byte write cycles.

CHIP CLEAR: The contents of the entire memory of the AT28C17 may be set to the high state by the CHIP CLEAR operation. By setting CE low and OE to 12 volts, the chip is cleared when a 10 msec low pulse is applied to WE.

DEVICE IDENTIFICATION: An extra 32 bytes of E²PROM memory are available to the user for device identification. By raising A9 to 12 ± 0.5 V and using address locations 7E0H to 7FFH the additional bytes may be written to or read from in the same manner as the regular memory array.

D.C. and A.C. Operating Range

Note: 1. This parameter is characterized and is not 100% tested.

A.C. Read Characteristics

Symbol	Parameter	AT28C17-15		AT28C17-20		AT28C17-25		Units
		Min	Max	Min	Max	Min	Max	
t_{ACC}	Address to Output Delay		150		200		250	ns
$t_{CE}^{(1)}$	$\overline{CE}$ to Output Delay		150		200		250	ns
$t_{OE}^{(2)}$	$\overline{OE}$ to Output Delay	10	70	10	80	10	100	ns
$t_{DF}^{(3,4)}$	$\overline{CE}$ or $\overline{OE}$ High to Output Float	0	50	0	55	0	60	ns
t_{OH}	Output Hold from $\overline{OE}$, $\overline{CE}$ or Address, whichever occurred first	0		0		0		ns

A.C. Read Waveforms^(1,2,3,4)

Notes:

- $\overline{CE}$ may be delayed up to $t_{ACC} - t_{CE}$ after the address transition without impact on t_{ACC} .
- $\overline{OE}$ may be delayed up to $t_{CE} - t_{OE}$ after the falling edge of $\overline{CE}$ without impact on t_{CE} or by $t_{ACC} - t_{OE}$ after an address change without impact on t_{ACC} .
- t_{DF} is specified from $\overline{OE}$ or $\overline{CE}$ whichever occurs first ($C_L = 5$ pF).
- This parameter is characterized and is not 100% tested.
