

## LMV761/LMV762

# Low Voltage, Precision Comparator with Push-Pull Output

### General Description

The LMV761/762 are precision comparators intended for applications requiring low noise and low input offset voltage. The LV761 single has a shutdown pin that can be used to disable the device and reduce the supply current. The LMV761 is available in a space saving SOT23-6 or SOIC-8 package. The LMV762 dual is available in SOIC-8 or MSOP-8 package.

They feature a CMOS input and Push-Pull output stage. The Push-Pull output stage eliminates the need for an external pull-up resistor.

The LMV761/762 are designed to meet the demands of small size, low power and high performance required by portable and battery operated electronics.

The input offset voltage has a typical value of  $200\mu\text{V}$  at room temp and a  $1\text{mV}$  limit over temp.

### Features

( $V_S = 5\text{V}$ ,  $T_A = 25^\circ\text{C}$ , Typical values unless specified)

- Input offset voltage  $0.2\text{mV}$
- Input offset voltage (max over temp)  $1\text{mV}$
- Input bias current  $0.2\text{pA}$
- Propagation delay (OD =  $50\text{mV}$ )  $120\text{ nsec}$
- Low supply current  $300\mu\text{A}$
- CMRR  $100\text{dB}$
- PSRR  $110\text{dB}$
- Extended Temperature Range  $-40^\circ\text{C}$  to  $125^\circ\text{C}$
- Push-pull output
- Ideal for  $2.7\text{V}$  and  $5\text{V}$  single supply applications
- Available in space-saving packages:
  - 6-Pin SOT23 (single w/shutdown)
  - 8-Pin SOIC (single w/shutdown)
  - 8-Pin SOIC/MSOP (dual without shutdown)

### Applications

- Portable and battery-powered systems
- Scanners
- Set top boxes
- High speed differential line receiver
- Window comparators
- Zero-crossing detectors
- High speed sampling circuits

### Typical Circuit

20037032

20037010

## Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

ESD Tolerance (Note 2)	
Human Body Model	2000V
Machine Model	200V
Supply Voltage ( $V^+ - V^-$ )	5.5V
Differential Input Voltage	Supply Voltage
Voltage between any two pins	Supply Voltage
Output Short Circuit to $V^+ - V^-$	
Soldering Information	
Infrared or Convection (20 sec.)	235°C

Wave Soldering (10 sec.)

260°C (Lead Temp)

Junction Temperature

150°C

Storage Temperature Range

-65°C to 150°C

## Operating Ratings

Supply Voltage ( $V^+ - V^-$ )	2.7V to 5.0V
Temperature Range	-40°C to +125°C
Package Thermal Resistance (Note 4)	
SOT23-6	265°C/W
SOIC-8	190°C/W
MSOP-8	235°C/W

## 2.7V Electrical Characteristics

Unless otherwise specified, all limited guaranteed for  $T_J = 25^\circ\text{C}$ ,  $V_{CM} = V^+/2$ ,  $V^+ = 2.7\text{V}$ ,  $V^- = 0\text{V}^-$ . **Boldface** limits apply at the temperature extremes. (Note 5)

Symbol	Parameter	Condition	Min (Note 7)	Typ (Note 6)	Max (Note 7)	Units
$V_{OS}$	Input Offset Voltage			0.2	<b>1.0</b>	mV
$I_B$	Input Bias Current (Note 8)			0.2	50	pA

		Overdrive = 50mV		120		
$t_{\text{SKEW}}$	Propagation Delay Skew			5		ns
$t_r$	Output Rise Time	10% to 90%		1.7		ns
$t_f$	Output Fall Time	90% to 10%		1.5		ns
$t_{on}$	Turn On Time from Shutdown			4		$\mu\text{s}$

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not guaranteed. For guaranteed specifications and the test condition, see the Electrical Characteristics.

**Note 2:** Unless otherwise specified human body model is  $1.5\text{k}\Omega$  in series with  $100\text{pF}$ . Machine model  $200\text{pF}$ .

**Note 3:** Electrical Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that  $T_J = T_A$ . No guarantee of parametric performance is indicated in the electrical tables under conditions of internal self-heating where  $T_J > T_A$ . See Application section for information on temperature de-rating of this device. Absolute Maximum Rating indicate junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.

**Note 4:** The maximum power dissipation is a function of  $T_{J(\text{MAX})}$ ,  $\theta_{JA}$ , and  $T_A$ . The maximum allowable power dissipation at any ambient temperature is  $P_D = (T_{J(\text{MAX})} - T_A)\theta_{JA}$ . All numbers apply for packages soldered directly into a PC board.

**Note 5:** Maximum temperature guarantee range is  $-40^\circ\text{C}$  to  $125^\circ\text{C}$ .

**Note 6:** Typical values represent the most likely parametric norm.

**Note 7:** All limits are guaranteed by testing or statistical analysis.

**Note 8:** Guaranteed by design

## Application Hints

### Basic Comparator

A basic comparator circuit is used to convert analog input signals to digital output signals. The comparator compares an input voltage ( $V_{IN}$ ) at the non-inverting input to the reference voltage ( $V_{REF}$ ) at the inverting pin. If  $V_{IN}$  is less than  $V_{REF}$  the output ( $V_O$ ) is low ( $V_{OL}$ ). However, if  $V_{IN}$  is greater than  $V_{REF}$ , the output voltage ( $V_O$ ) is high ( $V_{OH}$ ).

FIGURE 1. Basic Comparator

### Hysteresis

The basic comparator configuration may oscillate or produce a noisy output if the applied differential input is near the comparator's input offset voltage. This tends to occur when the voltage on one input is equal or very close to the other input voltage. Adding hysteresis can prevent this problem. Hysteresis creates two switching thresholds (one for the rising input voltage and the other for the falling input voltage). Hysteresis is the voltage difference between the two switching thresholds. When both inputs are nearly equal, hysteresis causes one input to effectively move quickly past the other. Thus, moving the input out of the region in which oscillation may occur.

Hysteresis can easily be added to a comparator in a non-inverting configuration with two resistors and positive feedback *Figure 2*. The output will switch from low to high when  $V_{IN}$  rises up to  $V_{IN1}$ , where  $V_{IN1}$  is calculated by

$$V_{IN1} = (V_{REF}(R_1+R_2))/R_2$$

The output will switch from high to low when  $V_{IN}$  falls to  $V_{IN2}$ , where  $V_{IN2}$  is calculated by

$$V_{IN2} = (V_{REF}(R_1+R_2) - V_{CC} R_1)/R_2$$

The Hysteresis is the difference between  $V_{IN1}$  and  $V_{IN2}$ .

$$\begin{aligned} \Delta V_{IN} &= V_{IN1} - V_{IN2} \\ &= ((V_{REF}(R_1+R_2))/R_2) - ((V_{REF}(R_1+R_2)) - (V_{CC} R_1))/R_2 \\ &= V_{CC} R_1/R_2 \end{aligned}$$

FIGURE 2. Non-Inverting Comparator Configuration

### Input

The LMV761/762 have near zero input bias current. This allows very high resistance circuits to be used without any concern for matching input resistances. This also allows the use of very small capacitors in R-C type timing circuits. This reduces the cost of the capacitors and amount of board space used.

### Shutdown Mode

The LMV761 features a low-power shutdown pin that is activated by driving  $\overline{SD}$  low. In shutdown mode, the output is in a high impedance state, supply current is reduced to 20nA and the comparator is disabled. Driving  $\overline{SD}$  high will turn the comparator on. The  $\overline{SD}$  pin should not be left unconnected due to the fact that it is a high impedance input. When left unconnected, the output will be at an unknown voltage. Also do not three-state the  $\overline{SD}$  pin.

The maximum input voltage for  $\overline{SD}$  is 5.5V, referred to ground and is not limited by  $V_{CC}$ . This allows the use of 5V logic to drive  $\overline{SD}$  while  $V_{CC}$  operates at a lower voltage, such as 3V. The logic threshold limits for  $\overline{SD}$  are proportional to  $V_{CC}$ .

### Board Layout and Bypassing

The LMV761/762 is designed to be stable and oscillation free, but it is still important to include the proper bypass capacitors and ground pickups. Ceramic 0.1 $\mu$ F capacitors should be placed at both supplies to provide clean switching. Minimize the length of signal traces to reduce stray capacitance.

### LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
