# Dual non-retriggerable monostable multivibrator with reset

## 74HC/HCT221

### FEATURES

- Pulse width variance is typically less than  $\pm 5\%$
- Pin-out identical to "123"
- Overriding reset terminates output pulse
- nB inputs have hysteresis for improved noise immunity
- Output capability: standard (except for nR<sub>EXT</sub>/C<sub>EXT</sub>)
- I<sub>CC</sub> category: MSI

### GENERAL DESCRIPTION

The 74HC/HCT221 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT221 are dual non-retriggerable monostable multivibrators. Each multivibrator features an active LOW-going edge input (n $\bar{A}$ ) and an active HIGH-going edge input (nB), either of which can be used as an enable input.

Pulse triggering occurs at a particular voltage level and is not directly related to the transition time of the input pulse. Schmitt-trigger input circuitry for the nB inputs allow

jitter-free triggering from inputs with slow transition rates, providing the circuit with excellent noise immunity.

Once triggered, the outputs (nQ, n $\bar{Q}$ ) are independent of further transitions of n $\bar{A}$  and nB inputs and are a function of the timing components. The output pulses can be terminated by the overriding active LOW reset inputs (n $\bar{R}_D$ ). Input pulses may be of any duration relative to the output pulse.

Pulse width stability is achieved through internal compensation and is virtually independent of V<sub>CC</sub> and temperature. In most applications pulse stability will only be limited by the accuracy of the external timing components.

The output pulse width is defined by the following relationship:

$$t_W = C_{EXT} R_{EXT} \ln 2$$

$$t_W = 0.7 C_{EXT} R_{EXT}$$

Pin assignments for the "221" are identical to those of the "123" so that the "221" can be substituted for those products in systems not using the retrigger by merely changing the value of R<sub>EXT</sub> and/or C<sub>EXT</sub>.

### QUICK REFERENCE DATA

GND = 0 V; T<sub>amb</sub> = 25 °C; t<sub>r</sub> = t<sub>f</sub> = 6 ns

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t <sub>PHL</sub>	propagation delay n $\bar{A}$ , nB, n $\bar{R}_D$ to nQ, n $\bar{Q}$	C <sub>L</sub> = 15 pF; V <sub>CC</sub> = 5 V; R <sub>EXT</sub> = 5 k $\Omega$ ; C <sub>EXT</sub> = 0 pF	29	32	ns
t <sub>PLH</sub>	n $\bar{A}$ , nB, n $\bar{R}_D$ to nQ, n $\bar{Q}$		35	36	ns
C <sub>I</sub>	input capacitance		3.5	3.5	pF
C <sub>PD</sub>	power dissipation capacitance per package	notes 1 and 2	90	96	pF

### Notes

1. C<sub>PD</sub> is used to determine the dynamic power dissipation (P<sub>D</sub> in  $\mu$ W):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) + 0.33 \times C_{EXT} \times V_{CC}^2 \times f_o + D \times 28 \times V_{CC} \quad \text{where:}$$

f<sub>i</sub> = input frequency in MHz; f<sub>o</sub> = output frequency in MHz

$\sum (C_L \times V_{CC}^2 \times f_o)$  = sum of outputs

C<sub>EXT</sub> = timing capacitance in pF; C<sub>L</sub> = output load capacitance in pF

V<sub>CC</sub> = supply voltage in V; D = duty factor in %

2. For HC the condition is V<sub>I</sub> = GND to V<sub>CC</sub>  
For HCT the condition is V<sub>I</sub> = GND to V<sub>CC</sub> – 1.5 V

Dual non-retriggerable monostable  
multivibrator with reset

74HC/HCT221

ORDERING INFORMATION

See “74HC/HCT/HCU/HCMOS Logic Package Information”.

PIN DESCRIPTION

PIN NO.	SYMBOL	NAME AND FUNCTION
1, 9	$1\bar{A}, 2\bar{A}$	trigger inputs (negative-edge triggered)
2, 10	1B, 2B	trigger inputs (positive-edge triggered)
3, 11	$1\bar{R}_D, 2\bar{R}_D$	direct reset inputs (active LOW)
4, 12	$1\bar{Q}, 2\bar{Q}$	outputs (active LOW)
7	$2R_{EXT}/C_{EXT}$	external resistor/capacitor connection
8	GND	ground (0 V)
13, 5	1Q, 2Q	outputs (active HIGH)
14, 6	$1C_{EXT}, 2C_{EXT}$	external capacitor connection
15	$1R_{EXT}/C_{EXT}$	external resistor/capacitor connection
16	VCC	positive supply voltage

Fig.1 Pin configuration.

Fig.2 Logic symbol.

Fig.3 IEC logic symbol.

Dual non-retriggerable monostable  
multivibrator with reset

74HC/HCT221

Fig.4 Functional diagram.

FUNCTION TABLE

INPUTS			OUTPUTS	
nRD	nA	nB	nQ	nQ
L	X	X	L	H
X	H	X	L (2)	H (2)
X	X	L	L (2)	H (2)
H	L	↑		
H	↓	H		
↑	L	H		

Notes

- H = HIGH voltage level  
L = LOW voltage level  
X = don't care  
↑ = LOW-to-HIGH level  
↓ = HIGH-to-LOW level  
 = one HIGH-level output pulse  
 = one LOW-level output pulse
- If the monostable was triggered before this condition was established the pulse will continue as programmed.
- For this combination the reset input must be LOW and the following sequence must be used:  
pin 1 (or 9) must be set HIGH or pin 2 (or 10) set LOW;  
then pin 1 (or 9) must be LOW and pin 2 (or 10) set HIGH. Now the reset input goes from LOW-to-HIGH and the device will be triggered.

## Dual non-retriggerable monostable multivibrator with reset

---

74HC/HCT221

### DC CHARACTERISTICS FOR 74HCT

For the DC characteristics see *"74HC/HCT/HCU/HCMOS Logic Family Specifications"*.

Output capability: standard (except for  $nR_{EXT}/C_{EXT}$ )

$I_{CC}$  category: MSI

### Note to HCT types

The value of additional quiescent supply current ( $\Delta I_{CC}$ ) for a unit load of 1 is given in the family specifications. To determine  $\Delta I_{CC}$  per input, multiply this value by the unit load coefficient shown in the table below.

INPUT	UNIT LOAD COEFFICIENT
nB	0.30
$n\bar{A}$	0.50
$n\bar{R}_D$	0.50

## Power-down consideration

A large capacitor ( $C_X$ ) may cause problems when powering-down the monostable due to the energy stored in this capacitor. When a system containing this device is powered-down or a rapid decrease of  $V_{CC}$  to zero occurs, the monostable may sustain damage, due to the capacitor discharging through the input protection diodes. To avoid this possibility, use a damping diode ( $D_X$ ) preferably a germanium or Schottky type diode able to withstand large current surges and connect as shown in Fig.17.

Fig.17 Power-down protection circuit.
