●Ratings

Item	Conditions	Specifications	
Rated power	Power must be derated according to the power derating curve in Figure 1 when ambient temperature exceeds 70°C.  Fig.1	0.125W (1 / 8W) [0.100W (1 / 10W)]* at 70°C	
Rated voltage	The voltage rating is calculated by the following equation. If the value obtained exceeds the maximum operating voltage, the voltage rating is equal to the maximum operating voltage. $E = \sqrt{P \times R}$ E: Rated voltage (V) P: Rated power (W) R: Nominal resistance (Ω)	Max. operating voltage	150V
		Max. overload voltage	200V (300V)*
		Max. intermittent overload voltage	200V (300V)*
Nominal resistance	See Table 1.		
Operating temperature		- 55°C to + 155°C	

* At power rating of 0.1W, maximum overload voltage and maximum intermittent overload voltage are 300V.

- Before using components in circuits where they will be exposed to transients such as pulse loads (short-duration, high-level loads), be certain to evaluate the component in the mounted state. In addition, the reliability and performance of this component cannot be guaranteed if it is used with a steady state voltage that is greater than its rated voltage.
