

1.3GHz bi-directional I²C bus controlled synthesizer**TSA5511****FEATURES**

- Complete 1.3 GHz single chip system
- Low power 5 V, 35 mA
- I²C-bus programming
- In-lock flag
- Varicap drive disable
- Low radiation
- Address selection for Picture-In-Picture (PIP), DBS tuner
- Analog-to-digital converter
- 8 bus controlled ports (5 for TSA5511T), 4 open collector outputs (bi-directional)
- Power-down flag

APPLICATIONS

- TV tuners
- VCR Tuners

DESCRIPTION

The TSA5511 is a single chip PLL frequency synthesizer designed for TV tuning systems. Control data is entered via the I²C-bus; five serial bytes are required to address the device, select the oscillator frequency, programme the eight output ports and set the charge-pump current. Four of these ports can also be used as input ports (three general purpose I/O ports, one ADC). Digital information concerning those ports can be read out of the TSA5511 on the SDA line (one status byte) during a READ operation. A flag is set when the loop is "in-lock" and is read during a READ operation. The device has one fixed I²C-bus address and 3 programmable addresses, programmed by applying a specific voltage on Port 3. The phase comparator operates at 7.8125 kHz when a 4 MHz crystal is used.

**QUICK REFERENCE DATA**

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT
V _{CC}	supply voltage	–	5	–	V
I _{CC}	supply current	–	35	–	mA
Δf	frequency range	64	–	1300	MHz

1.3GHz bi-directional I²C bus controlled synthesizer

TSA5511

FUNCTIONAL DESCRIPTION

The TSA5511 is controlled via the two-wire I²C-bus. For programming, there is one module address (7 bits) and the R/W bit for selecting READ or WRITE mode.

WRITE mode : R/W = 0 (see Table 1)

After the address transmission (first byte), data bytes can be sent to the device. Four data bytes are needed to fully program the TSA5511. The bus transceiver has an

auto-increment facility which permits the programming of the TSA5511 within one single transmission (address + 4 data bytes).

The TSA5511 can also be partially programmed on the condition that the first data byte following the address is byte 2 or byte 4. The meaning of the bits in the data bytes is given in Table 1. The first bit of the first data byte transmitted indicates whether frequency data (first bit = 0) or charge pump and port information (first bit = 1) will follow. Until an I²C-bus STOP condition is sent by

the controller, additional data bytes can be entered without the need to re-address the device. This allows a smooth frequency sweep for fine tuning or AFC purpose. At power-on the ports are set to the high impedance state.

The 7.8125 kHz reference frequency is obtained by dividing the output of the 4 MHz crystal oscillator by 512. Because the input of UHF/VHF signal is first divided by 8 the step size is 62.5 kHz. A 3.2 MHz crystal can offer step sizes of 50 kHz.

Table 1 Write data format

	MSB							LSB		
Address	1	1	0	0	0	MA1	MA0	0	A	byte 1
Programmable divider	0	N14	N13	N12	N11	N10	N9	N8	A	byte 2

TSA5511

FUNCTIONAL DESCRIPTION
(continued)**READ mode : $R/\overline{W} = 1$ (see Table 2)**

Data can be read out of the TSA5511 by setting the $R/\overline{W}$ bit to 1. After the slave address has been recognized, the TSA5511 generates an acknowledge pulse and the first data byte (status word) is transferred on the SDA line (MSB first). Data is valid on the SDA line during a high position of the SCL clock signal.

A second data byte can be read out of the TSA5511 if the processor generates an acknowledge on the

SDA line. End of transmission will occur if no acknowledge from the processor occurs.

The TSA5511 will then release the data line to allow the processor to generate a STOP condition. When ports P3 to P7 are used as inputs, they must be programmed in their high-impedance state.

The POR flag (power-on-reset) is set to 1 when V_{CC} goes below 3 V and at power-on. It is reset when an end of data is detected by the TSA5511 (end of a READ sequence).

Control of the loop is made possible with the in-lock flag FL which indicates (FL = 1) when the loop is

phase-locked. The bits I2, I1 and I0 represent the status of the I/O ports P7, P5 and P4 respectively. A logic 0 indicates a LOW level and a logic 1 a HIGH level (TTL levels).

A built-in 5-level ADC is available on I/O port P6. This converter can be used to feed AFC information to the controller from the IF section of the television as illustrated in the typical application circuit in Fig. 5. The relationship between bits A2, A1 and A0 and the input voltage on port P6 is given in Table 3.

Table 2 Read data format

	MSB							LSB		
Address	1	1	0	0	0	MA1	MA0	1	A	byte 1
Status byte	POR	FL	I2	I1	I0	A2	A1	A0	—	byte 2

POR	power-on-reset flag. (POR = 1 on power-on)
FL	in-lock flag (FL = 1 when the loop is phase-locked)
I2, I1, I0	digital information for I/O ports P7, P5 and P4 respectively
A2, A1, A0	digital outputs of the 5-level ADC. Accuracy is 1/2 LSB (see Table 3)

Address selection

The module address contains programmable address bits (MA1 and MA0) which together with the I/O port P3 offers the possibility of having several synthesizers (up to 3) in one system. The relationship between MA1 and MA0 and the input voltage I/O port P3 is given in Table 4.

MSB is transmitted first.

TSA5511

FLOCK FLAG DEFINITION (FL)

When the FL flag is 1, the maximum frequency deviation (Δf) from stable frequency can be expressed as follows:

$$\Delta f = \pm (K_{VCO} / K_O) \times I_{CP} \times (C1 + C2) / (C1 \times C2)$$

where:

- K_{VCO} = oscillator slope (Hz/V)
 I_{CP} = charge-pump current (A)
 K_O = 4×10^6
 $C1$ and $C2$ = loop filter capacitors

FLOCK FLAG APPLICATION

- $K_{VCO} = 16 \text{ MHz/V}$ (UHF band)
- $I_{CP} = 220 \mu\text{A}$
- $C1 = 180 \text{ nF}$
- $C2 = 39 \text{ nF}$
- $\Delta f = \pm 27.5 \text{ kHz}$.

Table 5 Flock flag settings

	MIN.	MAX.	UNIT
Time span between actual phase lock and FL-flag setting	1024	1152	μs
Time span between the loop losing lock and FL-flag resetting	0	128	μs
