Functional Description

The FCT374T and FCT574T are high-speed low-power octal D-type flip-flops featuring separate D-type inputs for each flip-flop. Both devices have three-state outputs for bus oriented applications. A buffered clock (CP) and output enable ($\overline{OE}$) are common to all flip-flops. The FCT574T is identical to FCT374T except for flow-through pinout to simplify board design. The eight flip-flops contained in the FCT374T and FCT574T will store the state of their individual D inputs that meet the set-up and hold time requirements on the LOW-to-HIGH clock (CP) transition. When $\overline{OE}$ is LOW, the contents of the eight flip-flops are available at the outputs. When $\overline{OE}$ is HIGH, the outputs will be in the high-impedance state. The state of output enable does not affect the state of the flip-flops.

The outputs are designed with a power-off disable feature to allow for live insertion of boards.

Notes:

- H = HIGH Voltage Level. L = LOW Voltage Level X = Don't Care Z = HIGH Impedance = LOW-to-HIGH clock transition
- Unless otherwise noted, these limits are over the operating free-air temperature range.
- Unused inputs must always be connected to an appropriate logic voltage level, preferably either V_{CC} or ground.
- T_A is the "instant on" case temperature.
- Typical values are at V_{CC}=5.0V, T_A=+25°C ambient.
- This parameter is guaranteed but not tested.
- Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high-speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parameters tests. In any sequence of parameter tests, I_{OS} tests should be performed last.
