## 1:5 Differential LVPECL/LVECL/HSTL Clock and Data Driver

MAX9316

### General Description

The MAX9316 is a low-skew, 1-to-5 differential driver designed for clock and data distribution. This device allows selection between two inputs: one differential and one single ended. The selected input is reproduced at five differential outputs. The differential input can be adapted to accept a single-ended input by connecting the on-chip  $V_{BB}$  supply to one input as a reference voltage.

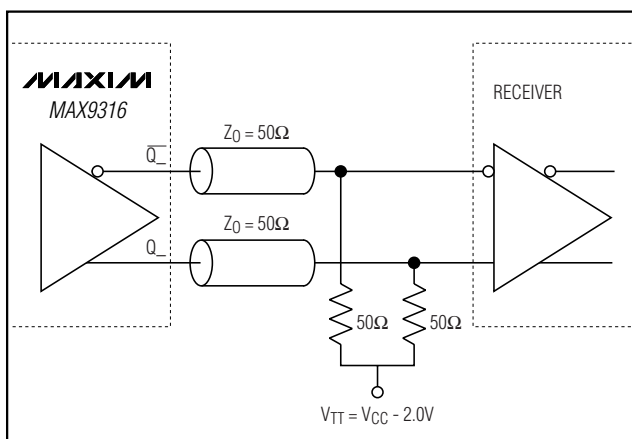

The MAX9316 features low output-to-output skew (20ps), making it ideal for clock and data distribution across a backplane or board. For interfacing to differential HSTL and LVPECL signals, this device operates over a +3.0V to +3.8V supply range, allowing high-performance clock or data distribution in systems with a nominal +3.3V supply. For differential LVECL operation, this device operates with a -3.0V to -3.8V supply.

The MAX9316 is offered in a space-saving 20-pin TSSOP and wide-body SO package.

### Applications

- Precision Clock Distribution
- Low-Jitter Data Repeater
- Data and Clock Driver and Buffer
- Central Office Backplane Clock Distribution
- DSLAM Backplane
- Base Station
- ATE

### Typical Application Circuit

Functional Diagram appears at end of data sheet.

### Features

- ◆ Guaranteed 400mV Differential Output at 1.5GHz
- ◆ Selectable Single-Ended or Differential Input
- ◆ 130ps (max) Part-to-Part Skew at +25°C
- ◆ 20ps Output-to-Output Skew
- ◆ 365ps Propagation Delay
- ◆ Synchronous Output Enable/Disable
- ◆ On-Chip Reference for Single-Ended Inputs
- ◆ Input Biased to Low when Open
- ◆ Pin Compatible with MC100LVEL14

### Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE
MAX9316EUP	-40°C to +85°C	20 TSSOP
MAX9316EWP*	-40°C to +85°C	20 Wide SO

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note 1:** Measurements are made with the device in thermal equilibrium.

**Note 2:** Current into a pin is defined as positive. Current out of a pin is defined as negative.

**Note 3:** DC parameters are production tested at  $T_A = +25^\circ C$  and guaranteed by design over the full operating temperature range.

**Note 4:** Use  $V_{BB}$  only for inputs that are on the same device as the  $V_{BB}$  reference.

**Note 5:** All pins are open except  $V_{CC}$  and  $V_{EE}$ .

**Note 6:** Guaranteed by design and characterization. Limits are set at  $\pm 6$  sigma.

**Note 7:** Measured between outputs of the same part at the signal crossing points for a same-edge transition.

**Note 8:** Measured between outputs of different parts at the signal crossing points under identical conditions for a same-edge transition.

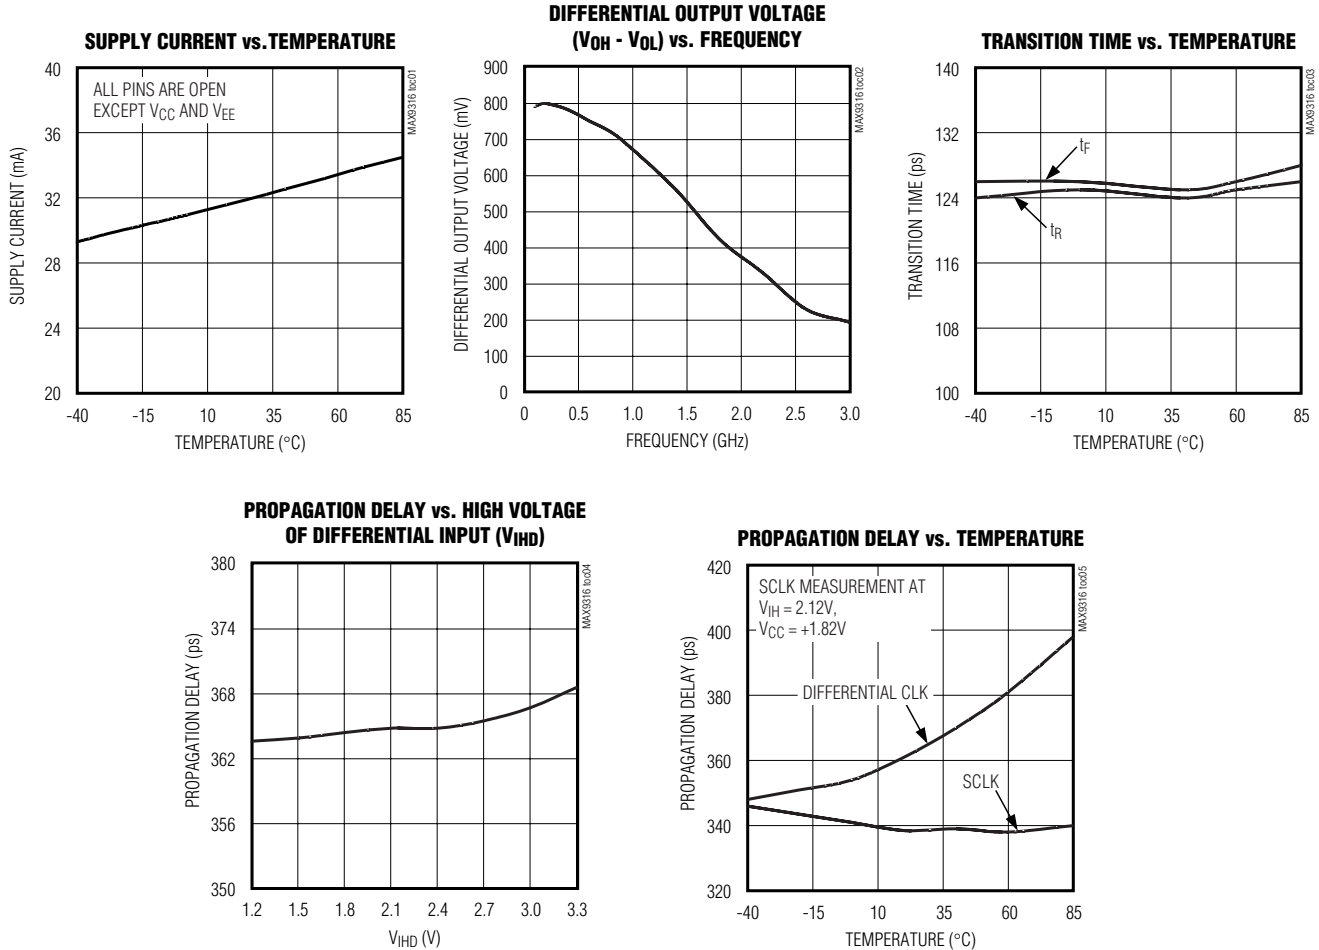

**Note 9:** Device jitter added to a jitter-free input signal.

# 1:5 Differential LVPECL/LVECL/HSTL Clock and Data Driver

## Pin Description

PIN	NAME	FUNCTION
1	Q0	Noninverting Q0 Output. Typically terminate with 50Ω resistor to (V <sub>CC</sub> - 2V).
2	$\overline{Q0}$	Inverting Q0 Output. Typically terminate with 50Ω resistor to (V <sub>CC</sub> - 2V).
3	Q1	Noninverting Q1 Output. Typically terminate with 50Ω resistor to (V <sub>CC</sub> - 2V).
4	$\overline{Q1}$	Inverting Q1 Output. Typically terminate with 50Ω resistor to (V <sub>CC</sub> - 2V).
5	Q2	Noninverting Q2 Output. Typically terminate with 50Ω resistor to (V <sub>CC</sub> - 2V).
6	$\overline{Q2}$	Inverting Q2 Output. Typically terminate with 50Ω resistor to (V <sub>CC</sub> - 2V).
7	Q3	Noninverting Q3 Output. Typically terminate with 50Ω resistor to (V <sub>CC</sub> - 2V).
8	$\overline{Q3}$	Inverting Q3 Output. Typically terminate with 50Ω resistor to (V <sub>CC</sub> - 2V).
9	Q4	Noninverting Q4 Output. Typically terminate with 50Ω resistor to (V <sub>CC</sub> - 2V).
10	$\overline{Q4}$	Inverting Q4 Output. Typically terminate with 50Ω resistor to (V <sub>CC</sub> - 2V).
11	V <sub>EE</sub>	Negative Supply Voltage
12	SEL	Clock Select Input (Single Ended). Drive low to select the CLK, $\overline{CLK}$ input. Drive high to select the SCLK input. The SEL threshold is equal to V <sub>BB</sub> . Internal 60kΩ pulldown to V <sub>EE</sub> .
13	V <sub>BB</sub>	Reference Output Voltage. Connect to the inverting or noninverting clock input to provide a reference for single-ended operation. When used, bypass with a 0.01μF ceramic capacitor to V <sub>CC</sub> ; otherwise, leave it unconnected.
14	$\overline{CLK}$	Inverting Differential Clock Input. Internal 75kΩ pullup to V <sub>CC</sub> and 75kΩ pulldown to V <sub>EE</sub> .
15	CLK	Noninverting Differential Clock Input. Internal 75kΩ pulldown to V <sub>EE</sub> .
16	SCLK	Single-Ended Clock Input. Internal 75kΩ pulldown to V <sub>EE</sub> .
17	NC	Not Internally Connected. Solder to PC board for package thermal dissipation.
18, 20	V <sub>CC</sub>	Positive Supply Voltage. Bypass V <sub>CC</sub> to V <sub>EE</sub> with 0.1μF and 0.01μF ceramic capacitors. Place the capacitors as close to the device as possible with the smaller value capacitor closest to the device.
19	$\overline{EN}$	Output Enable Input. Outputs are synchronously enabled on the falling edge of the clock input when $\overline{EN}$ is low. Outputs are synchronously set to low on the falling edge of the clock input when $\overline{EN}$ is high. Internal 60kΩ pulldown to V <sub>EE</sub> .

### Detailed Description

The MAX9316 is a low-skew, 1-to-5 differential driver designed for clock or data distribution. A 2-to-1 MUX selects one of the two clock inputs, CLK,  $\overline{CLK}$  and SCLK. The CLK and  $\overline{CLK}$  input is differential while the SCLK is single ended. The MUX is switched by the single-ended SEL input. A logic low selects the CLK input and a logic high selects the SCLK input. The SEL logic threshold is set by the internal voltage reference V<sub>BB</sub>. SEL input can be driven by V<sub>CC</sub> and V<sub>EE</sub> or by a single-ended LVPECL/LVECL signal. The selected input is reproduced at five differential outputs, Q0 to Q4.

### Synchronous Enable

The MAX9316 is synchronously enabled and disabled with outputs in the low state to eliminate shortened clock pulses.  $\overline{EN}$  is connected to the input of an edge-triggered D flip-flop. After power-up, drive  $\overline{EN}$  low and toggle the selected clock input to enable the outputs. The outputs are enabled on the falling edge of the selected clock input after  $\overline{EN}$  goes low. The outputs are disabled to a low state on the falling edge of the selected clock input after  $\overline{EN}$  goes high. The threshold for  $\overline{EN}$  is equal to V<sub>BB</sub>.

### Supply

For interfacing to differential HSTL and LVPECL signals, the V<sub>CC</sub> range is from +3.0 to +3.8V (with V<sub>EE</sub> ground-

# 1:5 Differential LVPECL/LVECL/HSTL Clock and Data Driver

MAX9316

ed), allowing high-performance clock or data distribution in systems with a nominal +3.3V supply. For interfacing to differential LVECL, the  $V_{EE}$  range is -3.0V to -3.8V (with  $V_{CC}$  grounded). Output levels are referenced to  $V_{CC}$  and are considered LVPECL or LVECL, depending on the level of the  $V_{CC}$  supply. With  $V_{CC}$  connected to a positive supply and  $V_{EE}$  connected to ground, the outputs are LVPECL. The outputs are LVECL when  $V_{CC}$  is connected to ground and  $V_{EE}$  is connected to a negative supply.

## Input Bias Resistors

When the inputs are open, the internal bias resistors set the inputs to low state. The inverting input (CLK) is biased with a  $75k\Omega$  pullup to  $V_{CC}$  and a  $75k\Omega$  pulldown to  $V_{EE}$ . The noninverting inputs (CLK) and the single-ended input (SCLK) are each biased with a  $75k\Omega$  pull-down to  $V_{EE}$ . The single-ended  $\overline{EN}$  and SEL inputs are each biased with a  $60k\Omega$  pulldown to  $V_{EE}$ .

## Differential Clock Input Limits

The maximum magnitude of the differential signal applied to the differential clock input is 3.0V. This limit also applies to the difference between any reference voltage input and a single-ended input. Specifications for the high and low voltages of a differential input ( $V_{IHD}$  and  $V_{ILD}$ ) and the differential input voltage ( $V_{IHD} - V_{ILD}$ ) apply simultaneously.

## Single-Ended Clock Input and $V_{BB}$

The differential clock input can be configured to accept a single-ended input. This is accomplished by connecting the on-chip reference voltage,  $V_{BB}$ , to the inverting or noninverting input of the differential input as a reference. For example, the differential CLK,  $\overline{CLK}$  input is converted to a noninverting, single-ended input by connecting  $V_{BB}$  to  $\overline{CLK}$  and connecting the single-ended input signal to CLK. Similarly, an inverting configuration is obtained by connecting  $V_{BB}$  to CLK and connecting the single-ended input to  $\overline{CLK}$ . With a differential input configured as single ended (using  $V_{BB}$ ), the single-ended input can be driven to  $V_{CC}$  and  $V_{EE}$  or with a single-ended LVPECL/LVECL signal. Note that the single-ended input must be least  $V_{BB} \pm 95mV$  or a differential input of at least 95mV to switch the outputs to the  $V_{OH}$  and  $V_{OL}$  levels specified in the *DC Electrical Characteristics* table.

When using the  $V_{BB}$  reference output, bypass it with a  $0.01\mu F$  ceramic capacitor to  $V_{CC}$ . If the  $V_{BB}$  reference is not used, leave it open. The  $V_{BB}$  reference can source or sink 0.5mA. Use  $V_{BB}$  only for an input that is on the same device as the  $V_{BB}$  reference.

## Applications Information

### Supply Bypassing

Bypass  $V_{CC}$  to  $V_{EE}$  with high-frequency surface-mount ceramic  $0.1\mu F$  and  $0.01\mu F$  capacitors in parallel as close to the device as possible, with the  $0.01\mu F$  capacitor closest to the device. Use multiple parallel vias to minimize parasitic inductance. When using the  $V_{BB}$  reference output, bypass it with a  $0.01\mu F$  ceramic capacitor to  $V_{CC}$  (if the  $V_{BB}$  reference is not used, it can be left open).

### Controlled-Impedance Traces

Input and output trace characteristics affect the performance of the MAX9316. Connect input and output signals with  $50\Omega$  characteristic impedance traces. Minimize the number of vias to prevent impedance discontinuities. Reduce reflections by maintaining the  $50\Omega$  characteristic impedance through cables and connectors. Reduce skew within a differential pair by matching the electrical length of the traces.

### Output Termination

Terminate outputs with  $50\Omega$  to  $V_{CC} - 2V$  or use an equivalent Thevenin termination. When a single-ended signal is taken from a differential output, terminate both outputs. For example, if Q0 is used as a single-ended output, terminate both Q0 and  $\overline{Q0}$ .
