

### Low Power RTC with Battery Backed SRAM

The ISL1218 device is a low power real time clock with timing and crystal compensation, clock/calendar, power fail indicator, periodic or polled alarm, intelligent battery backup switching and battery-backed user SRAM.

The oscillator uses an external, low-cost 32.768kHz crystal. The real time clock tracks time with separate registers for hours, minutes, and seconds. The device has calendar registers for date, month, year and day of the week. The calendar is accurate through 2099, with automatic leap year correction.

### Ordering Information

| PART NUMBER (Note) | PART MARKING | V <sub>DD</sub> RANGE | TEMP. RANGE (°C) | PACKAGE (Pb-Free)       |
|--------------------|--------------|-----------------------|------------------|-------------------------|
| ISL1218IBZ         | 1218IBZ      | 2.7V to 5.5V          | -40 to +85       | 8 Ld SOIC               |
| ISL1218IBZ-T       | 1218IBZ      | 2.7V to 5.5V          | -40 to +85       | 8 Ld SOIC Tape and Reel |
| ISL1218IUZ         | 1218Z        | 2.7V to 5.5V          | -40 to +85       | 8 Ld MSOP               |
| ISL1218IUZ-T       | 1218Z        | 2.7V to 5.5V          | -40 to +85       | 8 Ld MSOP Tape and Reel |

NOTE: Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

### Pinout

### Features

- Real Time Clock/Calendar
  - Tracks Time in Hours, Minutes, and Seconds
  - Day of the Week, Day, Month, and Year
- 15 Selectable Frequency Outputs
- Single Alarm
  - Settable to the Second, Minute, Hour, Day of the Week, Day, or Month
  - Single Event or Pulse Interrupt Mode
- Automatic Backup to Battery or Super Cap
- Power Failure Detection
- On-Chip Oscillator Compensation
- 8 Bytes Battery-Backed User SRAM
- *i<sup>2</sup>C* Interface
  - 400kHz Data Transfer Rate
- 400nA Battery Supply Current
- Same Pin Out as ST M41Txx and Maxim DS13xx Devices
- Small Package Options
  - 8 Ld MSOP and SOIC Packages
- Pb-Free Plus Anneal Available (RoHS Compliant)

### Applications

- Utility Meters
- HVAC Equipment
- Audio/Video Components
- Set Top Box/Television
- Modems
- Network Routers, Hubs, Switches, Bridges
- Cellular Infrastructure Equipment
- Fixed Broadband Wireless Equipment
- Pagers/PDA
- POS Equipment
- Test Meters/Fixtures
- Office Automation (Copiers, Fax)
- Home Appliances
- Computer Products
- Other Industrial/Medical/Automotive

## Block Diagram

## Pin Descriptions

| PIN NUMBER | SYMBOL                                        | DESCRIPTION                                                                                                                                                                                                 |
|------------|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1          | X1                                            | The X1 pin is the input of an inverting amplifier and is intended to be connected to one pin of an external 32.768kHz quartz crystal. X1 can also be driven directly from a 32.768kHz source.               |
| 2          | X2                                            | The X2 pin is the output of an inverting amplifier and is intended to be connected to one pin of an external 32.768kHz quartz crystal.                                                                      |
| 3          | V <sub>BAT</sub>                              | This input provides a backup supply voltage to the device. V <sub>BAT</sub> supplies power to the device in the event that the V <sub>DD</sub> supply fails. This pin should be tied to ground if not used. |
| 4          | GND                                           | Ground.                                                                                                                                                                                                     |
| 5          | SDA                                           | Serial Data (SDA) is a bidirectional pin used to transfer serial data into and out of the device. It has an open drain output and may be wire OR'ed with other open drain or open collector outputs.        |
| 6          | SCL                                           | The Serial Clock (SCL) input is used to clock all serial data into and out of the device.                                                                                                                   |
| 7          | $\overline{\text{IRQ}}/\text{F}_{\text{OUT}}$ | Interrupt Output/Frequency Output is a multi-functional pin that can be used as interrupt or frequency output pin. The function is set via the configuration register.                                      |
| 8          | V <sub>DD</sub>                               | Power supply.                                                                                                                                                                                               |

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

**NOTE:**

1.  $\theta_{JA}$  is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.

**DC Operating Characteristics – RTC** Temperature = -40°C to +85°C, unless otherwise stated.

| $R_{pu}$         | SDA and SCL Bus Pull-up Resistor Off-chip                        | Maximum is determined by $t_R$ and $t_F$ .<br>For $C_b = 400\text{pF}$ , max is about 2~2.5k $\Omega$ .<br>For $C_b = 40\text{pF}$ , max is about 15~20k $\Omega$ | 1                     |                 |     | k $\Omega$ | 6     |

## NOTES:

1.  $\overline{IRQ}$  and  $F_{OUT}$  Inactive.
2. LPMODE = 0 (default).
3. In order to ensure proper timekeeping, the  $V_{DD\ SR}$  specification must be followed.
4. Typical values are for  $T = 25^\circ\text{C}$  and 3.3V supply voltage.
5. These are I<sup>2</sup>C specific parameters and are not directly tested, however they are used during device testing to validate device specification.
6. A write to register 08h should only be done if  $V_{DD} > V_{BAT}$ , otherwise the device will be unable to communicate using I<sup>2</sup>C.

## SDA vs SCL Timing

## General Description

The ISL1218 device is a low power real time clock with timing and crystal compensation, clock/calendar, power fail indicator, periodic or polled alarm, intelligent battery backup switching, and battery-backed user SRAM.

The oscillator uses an external, low-cost 32.768kHz crystal. The real time clock tracks time with separate registers for hours, minutes, and seconds. The device has calendar registers for date, month, year and day of the week. The calendar is accurate through 2099, with automatic leap year correction.

The ISL1218's powerful alarm can be set to any clock/calendar value for a match. For example, every minute, every Tuesday or at 5:23 AM on March 21. The alarm status is available by checking the Status Register, or the device can be configured to provide a hardware interrupt via the IRQ pin. There is a repeat mode for the alarm allowing a periodic interrupt every minute, every hour, every day, etc.

The device also offers a backup power input pin. This  $V_{BAT}$  pin allows the device to be backed up by battery or SuperCap with automatic switchover from  $V_{DD}$  to  $V_{BAT}$ . The entire ISL1218 device is fully operational from 2.0V to 5.5V and the clock/calendar portion of the device remains fully operational down to 1.8V (Standby Mode).

## Pin Description

### X1, X2

The X1 and X2 pins are the input and output, respectively, of an inverting amplifier. An external 32.768kHz quartz crystal is used with the ISL1218 to supply a timebase for the real time clock. Internal compensation circuitry provides high accuracy over the operating temperature range from  $-40^{\circ}C$  to  $+85^{\circ}C$ . This oscillator compensation network can be used to calibrate the crystal timing accuracy over temperature either during manufacturing or with an external temperature sensor and microcontroller for active compensation. The device can also be driven directly from a 32.768kHz source at pin X1.

FIGURE 8. RECOMMENDED CRYSTAL CONNECTION

### $V_{BAT}$

This input provides a backup supply voltage to the device.  $V_{BAT}$  supplies power to the device in the event that the  $V_{DD}$  supply fails. This pin can be connected to a battery, a Super Cap or tied to ground if not used.

### $\overline{IRQ}/F_{OUT}$ (Interrupt Output/Frequency Output)

This dual function pin can be used as an interrupt or frequency output pin. The  $\overline{IRQ}/F_{OUT}$  mode is selected via the frequency out control bits of the control/status register.

- **Interrupt Mode.** The pin provides an interrupt signal output. This signal notifies a host processor that an alarm has occurred and requests action. It is an open drain active low output.
- **Frequency Output Mode.** The pin outputs a clock signal which is related to the crystal frequency. The frequency output is user selectable and enabled via the I<sup>2</sup>C bus. It is an open drain active low output.

### Serial Clock (SCL)

The SCL input is used to clock all serial data into and out of the device. The input buffer on this pin is always active (not gated). It is disabled when the backup power supply on the  $V_{BAT}$  pin is activated to minimize power consumption.

### Serial Data (SDA)

SDA is a bidirectional pin used to transfer data into and out of the device. It has an open drain output and may be ORed with other open drain or open collector outputs. The input buffer is always active (not gated) in normal mode.

An open drain output requires the use of a pull-up resistor. The output circuitry controls the fall time of the output signal with the use of a slope controlled pull-down. The circuit is designed for 400kHz I<sup>2</sup>C interface speeds. It is disabled when the backup power supply on the  $V_{BAT}$  pin is activated.

### $V_{DD}$ , GND

Chip power supply and ground pins. The device will operate with a power supply from 2.0V to 5.5VDC. A 0.1μF capacitor is recommended on the  $V_{DD}$  pin to ground.

## Functional Description

### Power Control Operation

The power control circuit accepts a  $V_{DD}$  and a  $V_{BAT}$  input. Many types of batteries can be used with Intersil RTC products. For example, 3.0V or 3.6V Lithium batteries are appropriate, and battery sizes are available that can power

the ISL1218 for up to 10 years. Another option is to use a Super Cap for applications where  $V_{DD}$  is interrupted for up to a month. See the Applications Section for more information.

### Normal Mode ( $V_{DD}$ ) to Battery Backup Mode ( $V_{BAT}$ )

To transition from the  $V_{DD}$  to  $V_{BAT}$  mode, both of the following conditions must be met:

#### Condition 1:

$$V_{DD} < V_{BAT} - V_{BATHYS}$$

where  $V_{BATHYS} \approx 50\text{mV}$

#### Condition 2:

$$V_{DD} < V_{TRIP}$$

where  $V_{TRIP} \approx 2.2\text{V}$

### Battery Backup Mode ( $V_{BAT}$ ) to Normal Mode ( $V_{DD}$ )

The ISL1218 device will switch from the  $V_{BAT}$  to  $V_{DD}$  mode when one of the following conditions occurs:

#### Condition 1:

$$V_{DD} > V_{BAT} + V_{BATHYS}$$

where  $V_{BATHYS} \approx 50\text{mV}$

#### Condition 2:

$$V_{DD} > V_{TRIP} + V_{TRIPHS}$$

where  $V_{TRIPHS} \approx 30\text{mV}$

These power control situations are illustrated in Figures 9 and 10.

FIGURE 9. BATTERY SWITCHOVER WHEN  $V_{BAT} < V_{TRIP}$

FIGURE 10. BATTERY SWITCHOVER WHEN  $V_{BAT} > V_{TRIP}$

The I<sup>2</sup>C bus is deactivated in battery backup mode to provide lower power. Aside from this, all RTC functions are operational during battery backup mode. Except for SCL and SDA, all the inputs and outputs of the ISL1218 are active during battery backup mode unless disabled via the control register. The User SRAM is operational in battery backup mode down to 2V.

### Power Failure Detection

The ISL1218 provides a Real Time Clock Failure Bit (RTCF) to detect total power failure. It allows users to determine if the device has powered up after having lost all power to the device (both  $V_{DD}$  and  $V_{BAT}$ ).

### Low Power Mode

The normal power switching of the ISL1218 is designed to switch into battery backup mode only if the  $V_{DD}$  power is lost. This will ensure that the device can accept a wide range of backup voltages from many types of sources while reliably switching into backup mode. Another mode, called Low Power Mode, is available to allow direct switching from  $V_{DD}$  to  $V_{BAT}$  without requiring  $V_{DD}$  to drop below  $V_{TRIP}$ . Since the additional monitoring of  $V_{DD}$  vs  $V_{TRIP}$  is no longer needed, that circuitry is shut down and less power is used while operating from  $V_{DD}$ . Power savings are typically 600nA at  $V_{DD} = 5\text{V}$ . Low Power Mode is activated via the LPMODE bit in the control and status registers.

Low Power Mode is useful in systems where  $V_{DD}$  is normally higher than  $V_{BAT}$  at all times. The device will switch from  $V_{DD}$  to  $V_{BAT}$  when  $V_{DD}$  drops below  $V_{BAT}$ , with about 50mV of hysteresis to prevent any switchback of  $V_{DD}$  after switchover. In a system with a  $V_{DD} = 5\text{V}$  and backup lithium battery of  $V_{BAT} = 3\text{V}$ , Low Power Mode can be used. However, it is not recommended to use Low Power Mode in a system with  $V_{DD} = 3.3\text{V} \pm 10\%$ ,  $V_{BAT} \geq 3.0\text{V}$ , and when there is a finite I-R voltage drop in the  $V_{DD}$  line.

### InterSeal™ Battery Saver

The ISL1218 has the InterSeal™ Battery Saver which prevents initial battery current drain before it is first used. For example, battery-backed RTCs are commonly packaged on a board with a battery connected. In order to preserve battery life, the ISL1218 will not draw any power from the battery source until after the device is first powered up from the  $V_{DD}$  source. Thereafter, the device will switchover to battery backup mode whenever  $V_{DD}$  power is lost.

### Real Time Clock Operation

The Real Time Clock (RTC) uses an external 32.768kHz quartz crystal to maintain an accurate internal representation of second, minute, hour, day of week, date, month, and year. The RTC also has leap-year correction. The clock also corrects for months having fewer than 31 days and has a bit that controls 24 hour or AM/PM format. When the ISL1218 powers up after the loss of both  $V_{DD}$  and  $V_{BAT}$ , the clock will not begin incrementing until at least one byte is written to the clock register.

### Accuracy of the Real Time Clock

The accuracy of the Real Time Clock depends on the frequency of the quartz crystal that is used as the time base for the RTC. Since the resonant frequency of a crystal is temperature dependent, the RTC performance will also be dependent upon temperature. The frequency deviation of the crystal is a function of the turnover temperature of the crystal from the crystal's nominal frequency. For example, a ~20ppm frequency deviation translates into an accuracy of ~1 minute per month. These parameters are available from the crystal manufacturer. The ISL1218 provides on-chip crystal compensation networks to adjust load capacitance to tune oscillator frequency from -94ppm to +140ppm. For more detailed information see the Application Section.

### Single Event and Interrupt

The alarm mode is enabled via the ALME bit. Choosing single event or interrupt alarm mode is selected via the IM bit. Note that when the frequency output function is enabled, the alarm function is disabled.

The standard alarm allows for alarms of time, date, day of the week, month, and year. When a time alarm occurs in single event mode, an  $\overline{\text{IRQ}}$  pin will be pulled low and the alarm status bit (ALM) will be set to "1".

The pulsed interrupt mode allows for repetitive or recurring alarm functionality. Hence, once the alarm is set, the device will continue to alarm for each occurring match of the alarm and present time. Thus, it will alarm as often as every minute (if only the nth second is set) or as infrequently as once a year (if at least the nth month is set). During pulsed interrupt mode, the  $\overline{\text{IRQ}}$  pin will be pulled low for 250ms and the alarm status bit (ALM) will be set to "1".

NOTE: The ALM bit can be reset by the user or cleared automatically using the auto reset mode (see ARST bit).

The alarm function can be enabled/disabled during battery backup mode using the FOBATB bit. For more information on the alarm, please see the Alarm Registers Description.

### Frequency Output Mode

The ISL1218 has the option to provide a frequency output signal using the  $\overline{\text{IRQ}}/\text{F}_{\text{OUT}}$  pin. The frequency output mode is set by using the FO bits to select 15 possible output frequency values from 0 to 32kHz. The frequency output can be enabled/disabled during battery backup mode using the FOBATB bit.

### General Purpose User SRAM

The ISL1218 provides 8 bytes of user SRAM. The SRAM will continue to operate in battery backup mode. However, it should be noted that the I<sup>2</sup>C bus is disabled in battery backup mode.

### I<sup>2</sup>C Serial Interface

The ISL1218 has an I<sup>2</sup>C serial bus interface that provides access to the control and status registers and the user SRAM. The I<sup>2</sup>C serial interface is compatible with other industry I<sup>2</sup>C serial bus protocols using a bidirectional data signal (SDA) and a clock signal (SCL).

### Oscillator Compensation

The ISL1218 provides the option of timing correction due to temperature variation of the crystal oscillator for either manufacturing calibration or active calibration. The total possible compensation is typically -94ppm to +140ppm. Two compensation mechanisms that are available are as follows:

1. An analog trimming (ATR) register that can be used to adjust individual on-chip digital capacitors for oscillator capacitance trimming. The individual digital capacitor is selectable from a range of 9pF to 40.5pF (based upon 32.758kHz). This translates to a calculated compensation of approximately -34ppm to +80ppm. (See ATR description.)
2. A digital trimming register (DTR) that can be used to adjust the timing counter by  $\pm 60$ ppm. (See DTR description.)

Also provided is the ability to adjust the crystal capacitance when the ISL1218 switches from V<sub>DD</sub> to battery backup mode. (See Battery Mode ATR Selection for more details.)

### Register Descriptions

The battery-backed registers are accessible following a slave byte of "1101111x" and reads or writes to addresses [00h:19h]. The defined addresses and default values are described in the Table 1. Address 09h is not used. Reads or writes to 09h will not affect operation of the device but should be avoided.

### REGISTER ACCESS

The contents of the registers can be modified by performing a byte or a page write operation directly to any register address.

The registers are divided into 4 sections. These are:

1. Real Time Clock (7 bytes): Address 00h to 06h.
2. Control and Status (5 bytes): Address 07h to 0Bh.
3. Alarm (6 bytes): Address 0Ch to 11h.
4. User SRAM (8 bytes): Address 12h to 19h.

There are no addresses above 19h.

Write capability is allowable into the RTC registers (00h to 06h) only when the WRTC bit (bit 4 of address 07h) is set to "1". **A multi-byte read or write operation is limited to one section per operation.** Access to another section requires a new operation. A read or write can begin at any address within the section.

A register can be read by performing a random read at any address at any time. This returns the contents of that register location. Additional registers are read by performing a sequential read. For the RTC and Alarm registers, the read

instruction latches all clock registers into a buffer, so an update of the clock does not change the time being read. A sequential read will not result in the output of data from the memory array. At the end of a read, the master supplies a stop condition to end the operation and free the bus. After a read, the address remains at the previous address +1 so the user can execute a current address read and continue reading the next register.

It is not necessary to set the WRTC bit prior to writing into the control and status, alarm, and user SRAM registers.

TABLE 1. REGISTER MEMORY MAP

| ADDR. | SECTION            | REG NAME | BIT      |        |          |        |          |       |       |       | RANGE | DEFAULT |

## Real Time Clock Registers

### Addresses [00h to 06h]

#### RTC REGISTERS (SC, MN, HR, DT, MO, YR, DW)

These registers depict BCD representations of the time. As such, SC (Seconds) and MN (Minutes) range from 0 to 59, HR (Hour) can either be a 12-hour or 24-hour mode, DT (Date) is 1 to 31, MO (Month) is 1 to 12, YR (Year) is 0 to 99, and DW (Day of the Week) is 0 to 6.

The DW register provides a Day of the Week status and uses three bits DW2 to DW0 to represent the seven days of the week. The counter advances in the cycle 0-1-2-3-4-5-6-0-1-2-... The assignment of a numerical value to a specific day of the week is arbitrary and may be decided by the system software designer. The default value is defined as "0".

#### 24 HOUR TIME

If the MIL bit of the HR register is "1", the RTC uses a 24-hour format. If the MIL bit is "0", the RTC uses a 12-hour format and HR21 bit functions as an AM/PM indicator with a "1" representing PM. The clock defaults to 12-hour format time with HR21 = "0".

#### LEAP YEARS

Leap years add the day February 29 and are defined as those years that are divisible by 4. Years divisible by 100 are not leap years, unless they are also divisible by 400. This means that the year 2000 is a leap year, the year 2100 is not. The ISL1218 does not correct for the leap year in the year 2100.

## Control and Status Registers

### Addresses [07h to 0Bh]

The Control and Status Registers consist of the Status Register, Interrupt and Alarm Register, Analog Trimming and Digital Trimming Registers.

#### Status Register (SR)

The Status Register is located in the memory map at address 07h. This is a volatile register that provides either control or status of RTC failure, battery mode, alarm trigger, write protection of clock counter, crystal oscillator enable and auto reset of status bits.

TABLE 2. STATUS REGISTER (SR)

| ADDR    | 7    | 6      | 5        | 4    | 3        | 2   | 1   | 0    |
|---------|------|--------|----------|------|----------|-----|-----|------|
| 07h     | ARST | XTOSCB | reserved | WRTC | reserved | ALM | BAT | RTCF |
| Default | 0    | 0      | 0        | 0    | 0        | 0   | 0   | 0    |

#### REAL TIME CLOCK FAIL BIT (RTCF)

This bit is set to a "1" after a total power failure. This is a read only bit that is set by hardware (ISL1218 internally) when the device powers up after having lost all power to the device. The bit is set regardless of whether  $V_{DD}$  or  $V_{BAT}$  is applied first. The loss of only one of the supplies does not set the RTCF bit to "1". The first valid write to the RTC section after a complete power failure resets the RTCF bit to "0" (writing one byte is sufficient).

#### BATTERY BIT (BAT)

This bit is set to a "1" when the device enters battery backup mode. This bit can be reset either manually by the user or automatically reset by enabling the auto-reset bit (see ARST bit). A write to this bit in the SR can only set it to "0", not "1".

#### ALARM BIT (ALM)

These bits announce if the alarm matches the real time clock. If there is a match, the respective bit is set to "1". This bit can be manually reset to "0" by the user or automatically reset by enabling the auto-reset bit (see ARST bit). A write to this bit in the SR can only set it to "0", not "1".

NOTE: An alarm bit that is set by an alarm occurring during an SR read operation will remain set after the read operation is complete.

#### WRITE RTC ENABLE BIT (WRTC)

The WRTC bit enables or disables write capability into the RTC Timing Registers. The factory default setting of this bit is "0". Upon initialization or power up, the WRTC must be set to "1" to enable the RTC. Upon the completion of a valid write (STOP), the RTC starts counting. The RTC internal 1Hz signal is synchronized to the STOP condition during a valid write cycle.

#### CRYSTAL OSCILLATOR ENABLE BIT (XTOSCB)

This bit enables/disables the internal crystal oscillator. When the XTOSCB is set to "1", the oscillator is disabled, and the X1 pin allows for an external 32kHz signal to drive the RTC. The XTOSCB bit is set to "0" on powerup.

#### AUTO RESET ENABLE BIT (ARST)

This bit enables/disables the automatic reset of the BAT and ALM status bits only. When ARST bit is set to "1", these status bits are reset to "0" after a valid read of the respective status register (with a valid STOP condition). When the ARST is cleared to "0", the user must manually reset the BAT and ALM bits.

### Interrupt Control Register (INT)

TABLE 3. INTERRUPT CONTROL REGISTER (INT)

| ADDR    | 7  | 6    | 5      | 4      | 3   | 2   | 1   | 0   |
|---------|----|------|--------|--------|-----|-----|-----|-----|
| 08h     | IM | ALME | LPMODE | FOBATB | FO3 | FO2 | FO1 | FO0 |
| Default | 0  | 0    | 0      | 0      | 0   | 0   | 0   | 0   |

The interrupt control register contains Frequency Output, Alarm, and Battery switchover control bits.

NOTE: Writing to register 08h has restrictions. If  $V_{BAT} > V_{DD}$ , then no byte writes to register 08h are allowed, only page writes beginning with register 07h. If  $V_{DD} > V_{BAT}$ , then a byte write to register 08h is allowed, as well as page writes.

### FREQUENCY OUT CONTROL BITS (FO <3:0>)

These bits enable/disable the frequency output function and select the output frequency at the  $\overline{IRQ}/F_{OUT}$  pin. See Table 4 for frequency selection. When the frequency mode is enabled, it will override the alarm mode at the  $\overline{IRQ}/F_{OUT}$  pin.

TABLE 4. FREQUENCY SELECTION OF  $F_{OUT}$  PIN

| FREQUENCY,<br>$F_{OUT}$ | UNITS | FO3 | FO2 | FO1 | FO0 |
|-------------------------|-------|-----|-----|-----|-----|
| 0                       | Hz    | 0   | 0   | 0   | 0   |
| 32768                   | Hz    | 0   | 0   | 0   | 1   |
| 4096                    | Hz    | 0   | 0   | 1   | 0   |
| 1024                    | Hz    | 0   | 0   | 1   | 1   |
| 64                      | Hz    | 0   | 1   | 0   | 0   |
| 32                      | Hz    | 0   | 1   | 0   | 1   |
| 16                      | Hz    | 0   | 1   | 1   | 0   |
| 8                       | Hz    | 0   | 1   | 1   | 1   |
| 4                       | Hz    | 1   | 0   | 0   | 0   |
| 2                       | Hz    | 1   | 0   | 0   | 1   |
| 1                       | Hz    | 1   | 0   | 1   | 0   |
| 1/2                     | Hz    | 1   | 0   | 1   | 1   |
| 1/4                     | Hz    | 1   | 1   | 0   | 0   |
| 1/8                     | Hz    | 1   | 1   | 0   | 1   |
| 1/16                    | Hz    | 1   | 1   | 1   | 0   |
| 1/32                    | Hz    | 1   | 1   | 1   | 1   |

### FREQUENCY OUTPUT AND INTERRUPT BIT (FOBATB)

This bit enables/disables the  $F_{OUT}/\overline{IRQ}$  pin during battery backup mode (i.e.  $V_{BAT}$  power source active). When the FOBATB is set to "1" the  $F_{OUT}/\overline{IRQ}$  pin is disabled during battery backup mode. This means that both the frequency output and alarm output functions are disabled. When the FOBATB is cleared to "0", the  $F_{OUT}/\overline{IRQ}$  pin is enabled during battery backup mode.

### LOW POWER MODE BIT (LPMODE)

This bit enables/disables low power mode. With LPMODE = "0", the device will be in normal mode and the  $V_{BAT}$  supply will be used when  $V_{DD} < V_{BAT} - V_{BATHYS}$  and  $V_{DD} < V_{TRIP}$ . With LPMODE = "1", the device will be in low power mode and the  $V_{BAT}$  supply will be used when  $V_{DD} < V_{BAT} - V_{BATHYS}$ . There is a supply current saving of about 600nA when using LPMODE = "1" with  $V_{DD} = 5V$ . (See Typical Performance Curves:  $I_{DD}$  vs  $V_{CC}$  with LPMODE ON and OFF.)

It should be noted that any writes to the LPMODE bit that may put the device into Low Power Mode should be avoided if  $V_{DD} < V_{BAT}$ , as the device will no longer communicate over the I<sup>2</sup>C interface (until  $V_{DD}$  rises above  $V_{BAT}$ ).

### ALARM ENABLE BIT (ALME)

This bit enables/disables the alarm function. When the ALME bit is set to "1", the alarm function is enabled. When the ALME is cleared to "0", the alarm function is disabled. The alarm function can operate in either a single event alarm or a periodic interrupt alarm (see IM bit).

NOTE: When the frequency output mode is enabled, the alarm function is disabled.

### INTERRUPT/ALARM MODE BIT (IM)

This bit enables/disables the interrupt mode of the alarm function. When the IM bit is set to "1", the alarm will operate in the interrupt mode, where an active low pulse width of 250ms will appear at the  $\overline{IRQ}/F_{OUT}$  pin when the RTC is triggered by the alarm as defined by the alarm registers (0Ch to 11h). When the IM bit is cleared to "0", the alarm will operate in standard mode, where the  $\overline{IRQ}/F_{OUT}$  pin will be tied low until the ALM status bit is cleared to "0".

| IM BIT | INTERRUPT/ALARM FREQUENCY                    |
|--------|----------------------------------------------|
| 0      | Single Time Event Set By Alarm               |
| 1      | Repetitive/Recurring Time Event Set By Alarm |

### Analog Trimming Register

#### ANALOG TRIMMING REGISTER (ATR<5:0>)

FIGURE 11. DIAGRAM OF ATR

Six analog trimming bits, **ATR0** to **ATR5**, are provided in order to adjust the on-chip load capacitance value for frequency compensation of the RTC. Each bit has a different weight for capacitance adjustment. For example, using a Citizen CFS-206 crystal with different ATR bit combinations provides an estimated ppm adjustment range from -34 to +80ppm to the nominal frequency compensation. The combination of analog and digital trimming can give up to -94 to +140ppm of total adjustment.

The effective on-chip series load capacitance,  $C_{LOAD}$ , ranges from 4.5pF to 20.25pF with a mid-scale value of 12.5pF (default).  $C_{LOAD}$  is changed via two digitally controlled capacitors,  $C_{X1}$  and  $C_{X2}$ , connected from the X1 and X2 pins to ground (see Figure 11). The value of  $C_{X1}$  and  $C_{X2}$  is given by the following formula:

$$C_X = (16 \cdot \overline{b5} + 8 \cdot b4 + 4 \cdot b3 + 2 \cdot b2 + 1 \cdot b1 + 0.5 \cdot b0 + 9) \text{pF}$$

The effective series load capacitance is the combination of  $C_{X1}$  and  $C_{X2}$ :

$$C_{LOAD} = \frac{1}{\left(\frac{1}{C_{X1}} + \frac{1}{C_{X2}}\right)}$$

$$C_{LOAD} = \left(\frac{16 \cdot \overline{b5} + 8 \cdot b4 + 4 \cdot b3 + 2 \cdot b2 + 1 \cdot b1 + 0.5 \cdot b0 + 9}{2}\right) \text{pF}$$

For example,  $C_{LOAD}(\text{ATR} = 00000) = 12.5\text{pF}$ ,  $C_{LOAD}(\text{ATR} = 100000) = 4.5\text{pF}$ , and  $C_{LOAD}(\text{ATR} = 011111) = 20.25\text{pF}$ . The entire range for the series combination of load capacitance goes from 4.5pF to 20.25pF in 0.25pF steps. Note that these are typical values.

#### BATTERY MODE ATR SELECTION (BMATR <1:0>)

Since the accuracy of the crystal oscillator is dependent on the  $V_{DD}/V_{BAT}$  operation, the ISL1218 provides the capability to adjust the capacitance between  $V_{DD}$  and  $V_{BAT}$  when the device switches between power sources.

| BMATR1 | BMATR0 | DELTA CAPACITANCE (C <sub>BAT</sub> TO C <sub>VDD</sub> ) |
|--------|--------|-----------------------------------------------------------|
| 0      | 0      | 0pF                                                       |
| 0      | 1      | -0.5pF ( $\approx +2\text{ppm}$ )                         |
| 1      | 0      | +0.5pF ( $\approx -2\text{ppm}$ )                         |
| 1      | 1      | +1pF ( $\approx -4\text{ppm}$ )                           |

#### DIGITAL TRIMMING REGISTER (DTR <2:0>)

The digital trimming bits DTR0, DTR1, and DTR2 adjust the average number of counts per second and average the ppm error to achieve better accuracy.

- DTR2 is a sign bit. DTR2 = "0" means frequency compensation is >0. DTR2 = "1" means frequency compensation is <0.
- DTR1 and DTR0 are both scale bits. DTR1 gives 40ppm adjustment and DTR0 gives 20ppm adjustment.

A range from -60ppm to +60ppm can be represented by using these three bits (see Table 5).

TABLE 5. DIGITAL TRIMMING REGISTERS

| DTR REGISTER |      |      | ESTIMATED FREQUENCY PPM |
|--------------|------|------|-------------------------|
| DTR2         | DTR1 | DTR0 |                         |
| 0            | 0    | 0    | 0 (default)             |
| 0            | 0    | 1    | +20                     |
| 0            | 1    | 0    | +40                     |
| 0            | 1    | 1    | +60                     |
| 1            | 0    | 0    | 0                       |
| 1            | 0    | 1    | -20                     |
| 1            | 1    | 0    | -40                     |
| 1            | 1    | 1    | -60                     |

### Alarm Registers

#### Addresses [0Ch to 11h]

The alarm register bytes are set up identical to the RTC register bytes, except that the MSB of each byte functions as an enable bit (enable = "1"). These enable bits specify which alarm registers (seconds, minutes, etc) are used to make the comparison. Note that there is no alarm byte for year.

The alarm function works as a comparison between the alarm registers and the RTC registers. As the RTC advances, the alarm will be triggered once a match occurs between the alarm registers and the RTC registers. Any one alarm register, multiple registers, or all registers can be enabled for a match.

There are two alarm operation modes: Single Event and periodic Interrupt Mode:

- Single Event Mode** is enabled by setting the ALME bit to "1", the IM bit to "0", and disabling the frequency output. This mode permits a one-time match between the alarm registers and the RTC registers. Once this match occurs, the ALM bit is set to "1" and the IRQ output will be pulled low and will remain low until the ALM bit is reset. This can be done manually or by using the auto-reset feature.
- Interrupt Mode** is enabled by setting the ALME bit to "1", the IM bit to "1", and disabling the frequency output. The IRQ output will now be pulsed each time an alarm occurs. This means that once the interrupt mode alarm is set, it will continue to alarm for each occurring match of the alarm and present time. This mode is convenient for hourly or daily hardware interrupts in microcontroller applications such as security cameras or utility meter reading.

To clear an alarm, the ALM bit in the status register must be set to "0" with a write. Note that if the ARST bit is set to 1 (address 07h, bit 7), the ALM bit will automatically be cleared when the status register is read.

Below are examples of both Single Event and periodic Interrupt Mode alarms.

Example 1 – Alarm set with single interrupt (IM = "0")

A single alarm will occur on January 1 at 11:30am.

A. Set Alarm registers as follows:

| ALARM REGISTER | BIT |   |   |   |   |   |   |   | HEX | DESCRIPTION                |
|----------------|-----|---|---|---|---|---|---|---|-----|----------------------------|
|                | 7   | 6 | 5 | 4 | 3 | 2 | 1 | 0 |     |                            |
| SCA            | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 00h | Seconds disabled           |
| MNA            | 1   | 0 | 1 | 1 | 0 | 0 | 0 | 0 | B0h | Minutes set to 30, enabled |
| HRA            | 1   | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 91h | Hours set to 11, enabled   |
| DTA            | 1   | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 81h | Date set to 1, enabled     |
| MOA            | 1   | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 81h | Month set to 1, enabled    |
| DWA            | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 00h | Day of week disabled       |

B. Also the ALME bit must be set as follows:

| CONTROL REGISTER | BIT |   |   |   |   |   |   |   | HEX | DESCRIPTION  |
|------------------|-----|---|---|---|---|---|---|---|-----|--------------|
|                  | 7   | 6 | 5 | 4 | 3 | 2 | 1 | 0 |     |              |
| INT              | 0   | 1 | x | x | 0 | 0 | 0 | 0 | x0h | Enable Alarm |

xx indicate other control bits

After these registers are set, an alarm will be generated when the RTC advances to exactly 11:30am on January 1 (after seconds changes from 59 to 00) by setting the ALM bit in the status register to "1" and also bringing the IRQ output low.

Example 2 – Pulsed interrupt once per minute (IM="1")

Interrupts at one minute intervals when the seconds register is at 30 seconds.

A. Set Alarm registers as follows:

| ALARM REGISTER | BIT |   |   |   |   |   |   |   | HEX | DESCRIPTION                |
|----------------|-----|---|---|---|---|---|---|---|-----|----------------------------|
|                | 7   | 6 | 5 | 4 | 3 | 2 | 1 | 0 |     |                            |
| SCA            | 1   | 0 | 1 | 1 | 0 | 0 | 0 | 0 | B0h | Seconds set to 30, enabled |
| MNA            | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 00h | Minutes disabled           |
| HRA            | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 00h | Hours disabled             |
| DTA            | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 00h | Date disabled              |
| MOA            | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 00h | Month disabled             |
| DWA            | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 00h | Day of week disabled       |

B. Set the Interrupt register as follows:

| CONTROL REGISTER | BIT |   |   |   |   |   |   |   | HEX | DESCRIPTION               |
|------------------|-----|---|---|---|---|---|---|---|-----|---------------------------|
|                  | 7   | 6 | 5 | 4 | 3 | 2 | 1 | 0 |     |                           |
| INT              | 1   | 1 | x | x | 0 | 0 | 0 | 0 | x0h | Enable Alarm and Int Mode |

xx indicate other control bits

Once the registers are set, the following waveform will be seen at IRQ:-

Note that the status register ALM bit will be set each time the alarm is triggered, but does not need to be read or cleared.

## User Registers

### Addresses [12h to 19h]

These registers are 8 bytes of battery-backed user memory storage.

## I<sup>2</sup>C Serial Interface

The ISL1218 supports a bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is the master and the device being controlled is the slave. The master always initiates data transfers and provides the clock for both transmit and receive operations. Therefore, the ISL1218 operates as a slave device in all applications.

All communication over the I<sup>2</sup>C interface is conducted by sending the MSB of each byte of data first.

### Protocol Conventions

Data states on the SDA line can change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating START and STOP conditions (See Figure 12). On power up of the ISL1218, the SDA pin is in the input mode.

All I<sup>2</sup>C interface operations must begin with a START condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The ISL1218 continuously monitors the SDA and SCL lines for the START condition and does not respond to any command until this condition is met (See Figure 12). A START condition is ignored during the power-up sequence.

All I<sup>2</sup>C interface operations must be terminated by a STOP condition, which is a LOW to HIGH transition of SDA while SCL is HIGH (See Figure 12). A STOP condition at the end of a read operation or at the end of a write operation to memory only places the device in its standby mode.

An acknowledge (ACK) is a software convention used to indicate a successful data transfer. The transmitting device, either master or slave, releases the SDA bus after transmitting eight bits. During the ninth clock cycle, the receiver pulls the SDA line LOW to acknowledge the reception of the eight bits of data (See Figure 13).

The ISL1218 responds with an ACK after recognition of a START condition followed by a valid Identification Byte, and once again after successful receipt of an Address Byte. The

ISL1218 also responds with an ACK after receiving a Data Byte of a write operation. The master must respond with an ACK after receiving a Data Byte of a read operation.

## Application Section

### Oscillator Crystal Requirements

The ISL1218 uses a standard 32.768kHz crystal. Either through hole or surface mount crystals can be used. Table 6 lists some recommended surface mount crystals and the parameters of each. This list is not exhaustive and other surface mount devices can be used with the ISL1218 if their specifications are very similar to the devices listed. The crystal should have a required parallel load capacitance of 12.5pF and an equivalent series resistance of less than 50k. The crystal's temperature range specification should match the application. Many crystals are rated for -10°C to +60°C (especially through hole and tuning fork types), so an appropriate crystal should be selected if extended temperature range is required.

TABLE 6. SUGGESTED SURFACE MOUNT CRYSTALS

| MANUFACTURER | PART NUMBER      |
|--------------|------------------|
| Citizen      | CM200S           |
| Epson        | MC-405, MC-406   |
| Raltron      | RSM-200S         |
| SaRonix      | 32S12            |
| Ecliptek     | ECPSM29T-32.768K |
| ECS          | ECX-306          |
| Fox          | FSM-327          |

### Crystal Oscillator Frequency Adjustment

The ISL1218 device contains circuitry for adjusting the frequency of the crystal oscillator. This circuitry can be used to trim oscillator initial accuracy as well as adjust the frequency to compensate for temperature changes.

The Analog Trimming Register (ATR) is used to adjust the load capacitance seen by the crystal. There are six bits of ATR control, with linear capacitance increments available for adjustment. Since the ATR adjustment is essentially "pulling" the frequency of the oscillator, the resulting frequency changes will not be linear with incremental capacitance changes. The equations which govern pulling show that lower capacitor values of ATR adjustment will provide larger increments. Also, the higher values of ATR adjustment will produce smaller incremental frequency changes. These values typically vary from 6-10 ppm/bit at the low end to <1ppm/bit at the highest capacitance settings. The range afforded by the ATR adjustment with a typical surface mount crystal is typically -34 to +80ppm around the ATR=0 default setting because of this property. The user should note this when using the ATR for calibration. The temperature drift of the capacitance used in the ATR control is extremely low, so this feature can be used for temperature compensation with good accuracy.

In addition to the analog compensation afforded by the adjustable load capacitance, a digital compensation feature is available for the ISL1218. There are 3 bits known as the Digital Trimming Register (DTR). The range provided is  $\pm 60$ ppm in increments of 20ppm. DTR operates by adding or skipping pulses in the clock counter. It is very useful for coarse adjustments of frequency drift over temperature or extending the adjustment range available with the ATR register.

Initial accuracy is best adjusted by enabling the frequency output (using the INT register, address 08h), and monitoring the  $\sim$ IRQ/ $F_{OUT}$  pin with a calibrated frequency counter. The frequency used is unimportant, although 1Hz is the easiest to monitor. The gating time should be set long enough to ensure accuracy to at least 1ppm. The ATR should be set to the center position, or 100000Bh, to begin with. Once the initial measurement is made, then the ATR register can be changed to adjust the frequency. Note that increasing the ATR register for increased capacitance will lower the frequency, and vice-versa. If the initial measurement shows the frequency is far off, it will be necessary to use the DTR register to do a coarse adjustment. Note that most all crystals will have tight enough initial accuracy at room temperature so that a small ATR register adjustment should be all that is needed.

### Temperature Compensation

The ATR and DTR controls can be combined to provide crystal drift temperature compensation. The typical 32.768kHz crystal has a drift characteristic that is similar to that shown in Figure 17. There is a turnover temperature ( $T_0$ ) where the drift is very near zero. The shape is parabolic as it varies with the square of the difference between the actual temperature and the turnover temperature.

FIGURE 17. RTC CRYSTAL TEMPERATURE DRIFT

If full industrial temperature compensation is desired in an ISL1218 circuit, then both the DTR and ATR registers will need to be utilized (total correction range = -94 to +140ppm).

A system to implement temperature compensation would consist of the ISL1218, a temperature sensor, and a microcontroller. These devices may already be in the system so the function will just be a matter of implementing software and performing some calculations. Fairly accurate temperature compensation can be implemented just by using the crystal manufacturer's specifications for the turnover temperature  $T_0$  and the drift coefficient ( $\beta$ ). The formula for calculating the oscillator adjustment necessary is:

$$\text{Adjustment (ppm)} = (T - T_0)^2 * \beta$$

Once the temperature curve for a crystal is established, then the designer should decide at what discrete temperatures the compensation will change. Since drift is higher at extreme temperatures, the compensation may not be needed until the temperature is greater than 20°C from  $T_0$ .

A sample curve of the ATR setting vs. Frequency Adjustment for the ISL1218 and a typical RTC crystal is given in Figure 18. This curve may vary with different crystals, so it is good practice to evaluate a given crystal in an ISL1218 circuit before establishing the adjustment values.

FIGURE 18. ATR SETTING vs. OSCILLATOR FREQUENCY ADJUSTMENT

This curve is then used to figure what ATR and DTR settings are used for compensation. The results would be placed in a lookup table for the microcontroller to access.

### Layout Considerations

The crystal input at X1 has a very high impedance, and oscillator circuits operating at low frequencies such as 32.768kHz are known to pick up noise very easily if layout precautions are not followed. Most instances of erratic clocking or large accuracy errors can be traced to the susceptibility of the oscillator circuit to interference from adjacent high speed clock or data lines. Careful layout of the RTC circuit will avoid noise pickup and insure accurate clocking.

Figure 19 shows a suggested layout for the ISL1218 device using a surface mount crystal. Two main precautions should be followed:

Do not run the serial bus lines or any high speed logic lines in the vicinity of the crystal. These logic level lines can induce noise in the oscillator circuit to cause misclocking.

Add a ground trace around the crystal with one end terminated at the chip ground. This will provide termination for emitted noise in the vicinity of the RTC device.

FIGURE 19. SUGGESTED LAYOUT FOR ISL1218 AND CRYSTAL

In addition, it is a good idea to avoid a ground plane under the X1 and X2 pins and the crystal, as this will affect the load capacitance and therefore the oscillator accuracy of the circuit. If the  $\sim$ IRQ/F<sub>OUT</sub> pin is used as a clock, it should be routed away from the RTC device as well. The traces for the V<sub>BAT</sub> and V<sub>CC</sub> pins can be treated as a ground, and should be routed around the crystal.

### Super Capacitor Backup

The ISL1218 device provides a V<sub>BAT</sub> pin which is used for a battery backup input. A Super Capacitor can be used as an alternative to a battery in cases where shorter backup times are required. Since the battery backup supply current required by the ISL1218 is extremely low, it is possible to get months of backup operation using a Super Capacitor. Typical capacitor values are a few  $\mu$ F to 1 Farad or more depending on the application.

If backup is only needed for a few minutes, then a small inexpensive electrolytic capacitor can be used. For extended periods, a low leakage, high capacity Super Capacitor is the best choice. These devices are available from such vendors as Panasonic and Murata. The main specifications include working voltage and leakage current. If the application is for charging the capacitor from a +5V  $\pm$ 5% supply with a signal diode, then the voltage on the capacitor can vary from  $\sim$ 4.5V to slightly over 5.0V. A capacitor with a rated WV of 5.0V may have a reduced lifetime if the supply voltage is slightly high. The leakage current should be as small as possible. For example, a Super Capacitor should be specified with leakage of well below 1 $\mu$ A. A standard electrolytic capacitor with DC leakage current in the microamps will have a severely shortened backup time.

Below are some examples with equations to assist with calculating backup times and required capacitance for the ISL1218 device. The backup supply current plays a major part in these equations, and a typical value was chosen for

example purposes. For a robust design, a margin of 30% should be included to cover supply current and capacitance tolerances over the results of the calculations. Even more margin should be included if periods of very warm temperature operation are expected.

### Example 1. Calculating Backup Time Given Voltages and Capacitor Value

FIGURE 20. SUPERCAPACITOR CHARGING CIRCUIT

In Figure 20, use  $C_{BAT} = 0.47F$  and  $V_{CC} = 5.0V$ . With  $V_{CC} = 5.0V$ , the voltage at  $V_{BAT}$  will approach 4.7V as the diode turns off completely. The ISL1218 is specified to operate down to  $V_{BAT} = 1.8V$ . The capacitance charge/discharge equation is used to estimate the total backup time:

$$I = C_{BAT} * dV/dT \quad (EQ. 1)$$

Rearranging gives

$$dT = C_{BAT} * dV/I_{TOT} \text{ to solve for backup time.} \quad (EQ. 2)$$

$C_{BAT}$  is the backup capacitance and  $dV$  is the change in voltage from fully charged to loss of operation. Note that  $I_{TOT}$  is the total of the supply current of the ISL1218 ( $I_{BAT}$ ) plus the leakage current of the capacitor and the diode,  $I_{LKG}$ . In these calculations,  $I_{LKG}$  is assumed to be extremely small and will be ignored. If an application requires extended operation at temperatures over 50°C, these leakages will increase and hence reduce backup time.

Note that  $I_{BAT}$  changes with  $V_{BAT}$  almost linearly (see Typical Performance Curves). This allows us to make an approximation of  $I_{BAT}$ , using a value midway between the two endpoints. The typical linear equation for  $I_{BAT}$  vs  $V_{BAT}$  is:

$$I_{BAT} = 1.031E-7(V_{BAT}) + 1.036E-7 \text{ Amps} \quad (EQ. 3)$$

Using this equation to solve for the average current given 2 voltage points gives:

$$I_{BATAVG} = 5.155E-8(V_{BAT2} + V_{BAT1}) + 1.036E-7 \text{ Amps} \quad (EQ. 4)$$

Combining with Equation 2 gives the equation for backup time:

$$T_{BACKUP} = C_{BAT} * (V_{BAT2} - V_{BAT1}) / (I_{BATAVG} + I_{LKG}) \text{ seconds} \quad (EQ. 5)$$

where:

$$C_{BAT} = 0.47F$$

$$V_{BAT2} = 4.7V$$

$$V_{BAT1} = 1.8V$$

$$I_{LKG} = 0 \text{ (assumed minimal)}$$

Solving equation 4 for this example,  $I_{BATAVG} = 4.387E-7 \text{ A}$

$$T_{BACKUP} = 0.47 * (2.9) / 4.38E-7 = 3.107E6 \text{ sec}$$

Since there are 86,400 seconds in a day, this corresponds to 35.96 days. If the 30% tolerance is included for capacitor and supply current tolerances, then worst case backup time would be:

$$C_{BAT} = 0.70 * 35.96 = 25.2 \text{ days}$$

### Example 2. Calculating a Capacitor Value for a Given Backup Time

Referring to Figure 20 again, the capacitor value needs to be calculated to give 2 months (60 days) of backup time, given  $V_{CC} = 5.0V$ . As in Example 1, the  $V_{BAT}$  voltage will vary from 4.7V down to 1.8V. We will need to rearrange Equation 2 to solve for capacitance:

$$C_{BAT} = dT * I / dV \quad (EQ. 6)$$

Using the terms described above, this equation becomes:

$$C_{BAT} = T_{BACKUP} * (I_{BATAVG} + I_{LKG}) / (V_{BAT2} - V_{BAT1}) \quad (EQ. 7)$$

where:

$$T_{BACKUP} = 60 \text{ days} * 86,400 \text{ sec/day} = 5.18 \text{ E6 sec}$$

$$I_{BATAVG} = 4.387 \text{ E-7 A (same as Example 1)}$$

$$I_{LKG} = 0 \text{ (assumed)}$$

$$V_{BAT2} = 4.7V$$

$$V_{BAT1} = 1.8V$$

Solving gives:

$$C_{BAT} = 5.18 \text{ E6} * (4.387 \text{ E-7}) / (2.9) = 0.784F$$

If the 30% tolerance is included for tolerances, then worst case cap value would be:

$$C_{BAT} = 1.3 * .784 = 1.02F$$

## Mini Small Outline Plastic Packages (MSOP)

Rev. 2 01/03

#### NOTES:

- These package dimensions are within allowable dimensions of JEDEC MO-187BA.
- Dimensioning and tolerancing per ANSI Y14.5M-1994.
- Dimension "D" does not include mold flash, protrusions or gate burrs and are measured at Datum Plane. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
- Dimension "E1" does not include interlead flash or protrusions and are measured at Datum Plane. [-H-] Interlead flash and protrusions shall not exceed 0.15mm (0.006 inch) per side.
- Formed leads shall be planar with respect to one another within 0.10mm (0.004) at seating Plane.
- "L" is the length of terminal for soldering to a substrate.
- "N" is the number of terminal positions.
- Terminal numbers are shown for reference only.
- Dimension "b" does not include dambar protrusion. Allowable dambar protrusion shall be 0.08mm (0.003 inch) total in excess of "b" dimension at maximum material condition. Minimum space between protrusion and adjacent lead is 0.07mm (0.0027 inch).
- Datums [-A-] and [-B-] to be determined at Datum plane [-H-].
- Controlling dimension: MILLIMETER. Converted inch dimensions are for reference only.

## Small Outline Plastic Packages (SOIC)

### NOTES:

1. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. "L" is the length of terminal for soldering to a substrate.
7. "N" is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. The lead width "B", as measured 0.36mm (0.014 inch) or greater above the seating plane, shall not exceed a maximum value of 0.61mm (0.024 inch).
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.
